# Public Personnel Administration in Local Government, Japan

Motomichi Otani
Department of Policy Studies, Faculty of Law, Dokkyo University, Saitama, Japan

## Synonyms

Human resource management; Local public service personnel system; Personnel administration; Personnel management practices

## Definition

Overview of Japan's local public service personnel system and personnel management practices at local governments.

## Introduction

There are about 2.7 million local-government employees in Japan (figure as of April 1, 2017). These people, who mainly work for prefectures, cities, towns, and villages, are subject to the Local Public Service Act, the basic law that establishes the fundamental standards regarding their personnel matters, rights, and obligations (In addition to the Local Public Service Act, which serves as the basic law, there are also special laws, such as the Act on the Organization and Operation of Local Educational Administration, the Special Act for Education Personnel, the Police Act, the Fire and Disaster Management Organization Act, the Local Public Enterprise Act, and the Local Public Enterprise Labor Relationships Act. These laws together comprise the nation's local public service personnel system.).

This law regulates basic issues, creating an overall framework for the nation's local public service personnel system. The specific terms and conditions for their employment such as salaries and work hours are, for the most part, determined by each local government. Even so, the way in which employees' roles and responsibilities are defined is similar across local governments, as well as between local governments and the central government. For this reason, work conditions at most local governments are extremely similar. There are also many similarities between work conditions at local governments and those at the central government.

Take, for instance, the compensation structure. The law stipulates only the fundamental principles (the principle of job-linked salaries and the principle of salary regulations) and the types of allowances. The system is structured in such a way that each local government is free to determine its own salaries, within certain boundaries. In practice, however, all local governments have similar salary structures and pay scales.

Personnel practices at local governments are characterized, for instance, by the hiring of regular, permanent employees. They hire workers fresh out of school and promote them based on seniority. Local governments seldom recruit particular employees for specific career paths, preferring instead to rotate them on a regular basis to nurture generalists. Employees usually stay until retirement. However, efforts are now being made to introduce a personnel system linked with employees' ability and performance and to allow for diverse work arrangements.

## Overview of Japan's Local Public Service Personnel System

The concept of local-government workers did not exist prior to World War II. The National Public Service Act was established in 1947, soon after the war. The Local Public Service Act was created in 1950 to keep in step with the National Public Service Act. The Local Public Service Act is aimed at contributing to the realization of the principle of local autonomy, by guaranteeing the democratic and efficient operation of local governments through the establishment of a modern local public service personnel system. Such a personnel system has five requirements: employees must serve all; employees must be diligent; employees' ability and performance must be reflected in their job evaluations; employees must maintain political neutrality; and employees must be efficient in the execution of their public duties. The Local Public Service Act mainly seeks to establish two fundamental principles, or pillars. One principle relates to personnel organizations within local governments, while the other, personnel administration of local-government workers.

With regard to the first pillar, personnel organizations of local governments have "appointing authorities" who have the authority to appoint individual employees to certain positions. There are also "personnel commissions" and "equity commissions," which are independent committees overseeing the appointments made by appointing authorities.

Appointing authorities have the authority to appoint persons to certain positions with regard to employees' job status, remove them from their current positions, change their employment status, and issue reprimands. Those who serve as appointing authorities are governors, mayors, heads of education boards, police chiefs, fire chiefs, and administrators of public enterprises. This authority is given to several people to ensure that the power is not concentrated in the hands of any particular individual.

The personnel commissions and equity commissions are administrative committees that provide advice or assessments so that appointing authorities will be able to exercise their authority properly. They have similar functions as those of the National Personnel Authority of the central government. These committees, independent of the governors and mayors, operate under a collegial system and guarantee democratic and efficient personnel administration. Prefectures and designated cities are required to have personnel commissions. Cities and Tokyo's 23 special wards with a population of at least 150,000 people are required to have either personnel commissions or equity commissions. Cities, towns, and villages with a population of less than 150,000 must have equity commissions. As of March 2018, the nation's 47 prefectures and 20 designated cities had personnel commissions as required by law. The other entities that had personnel commissions were only Wakayama City and Tokyo's 23 wards.

Among the privileges reserved exclusively for personnel commissions is included the power to make recommendations regarding work conditions. This system of issuing recommendations has been established as a compensatory measure in light of certain restrictions imposed on local-government workers' basic labor rights (For example, general administrative employees do not have the right to strike. In addition, they do not have the right to conclude a collective agreement, even though they are allowed to engage in collective bargaining. Employees of police and fire departments do not have the right to organize, the right to engage in collective bargaining, or the right to strike.). Personnel commissions can make recommendations to governors or mayors and local assemblies to make local-government employees' salaries and work conditions better reflect the overall social and economic conditions or situations in particular geographical areas. Personnel commissions every year examine local-government salaries and private-sector salaries as part of a basic policy of matching the two. The commissions make recommendations regarding salary revisions by considering National Personnel Authority's annual salary recommendations, the situation in other prefectures or cities, cost of living for particular districts, and other issues.

Administrative tasks related to recruitment exams, in principle, fall under the authority of personnel commissions alone. However, equity commissions will be able to handle administrative duties related to recruitment exams if allowed by local bylaws. This provision exists because very few local governments have personnel commissions. In fact, the power regarding personnel matters tends to be concentrated in the hands of mayors in many local governments that do not have personnel commissions, raising concerns about the ability of local governments to ensure neutrality in hiring and to select candidates with appropriate expertise. For this reason, a decision was made to allow equity commissions to handle administrative duties related to recruitment exams in the absence of personnel commissions. The other pillar, personnel administration of local-government employees, relates to hiring, performance evaluations, salaries, hours of work and other work conditions, leave of absence, dismissals and reprimands, work duties, retirement, training, protection of employee benefits, and employee organizations. An overview of these issues will be provided in the next section along with a discussion of actual personnel-administration practices, beginning with employees' recruitment and concluding with their retirement.

## Personnel Management Practices at Local Governments

Local-government employees are basically full-time, permanent workers. Fixed-term workers and those who put in shorter work hours do exist, but they are an exception.

Employees are chosen through competitive exams administered variously in accordance with the candidates' education, such as college or high school, and the type of work, such as administrative or civil engineering. The personnel commission, if it exists within a particular local government, creates a list of job candidates and records the names and test scores of the successful candidates. The appointing authority will then decide whom to hire from among these persons.

There is no job classification system, nor are there any job-description documents (The Local Public Service Act had a rule providing for a job classification system in the past. However, the rule was abolished without being implemented.). Instead, required job skills are broadly defined for each position, such as staff member, section chief, division manager, and department director. Japanese local governments do not hire someone every time there is a vacancy. Instead, they hire a certain number of recruits every April (many of them fresh graduates) and rotate them among jobs every few years to give them a wide variety of experience. The central government's ministries and agencies, which are vertically administered, hire employees on their own. However, local governments seek to nurture generalists, because they are the comprehensive administrative organization in their own districts, and they need employees with a broad range of knowledge and experience.

Although there are some variations among local governments, employees usually experience various jobs with different sections during the first 10 years as part of their training. Their rotations will eventually be narrowed down to several fields, where they will be promoted to positions that are more senior. However, there are only a limited number of positions available at the management level. Thus, employees are occasionally assigned to sections where they have little experience. The characteristics of personnel management at local governments include a seniority-based promotion system and a slow selection process for senior positions. Employees hired in the same year are promoted in lockstep with one another, and it takes many years before they begin to hold positions of differing levels. Career bureaucrats at the central government will face a fierce game of musical chairs when this differentiation begins. "Losers" are often forced out and assigned to positions in affiliated organizations. However, local governments do not have such an "up or out" system, and losers will stay in the same organization until retirement. Consequently, one can frequently observe cases in which employees with more seniority end up holding

lower positions than those with less seniority, a situation rarely seen in the central government. Some local governments administer exams when selecting candidates for advancement. The process of career selection usually begins early at such workplaces.

Compensation comprises salaries, which are base payments, and various allowances. Three principles are applied in determining employee compensation: the principle of job-linked salaries, the principle of salary regulations, and the principle of equilibrium. The principle of job-linked salaries states that salaries must be based on employees' duties and responsibilities. The principle of salary regulations means that salaries must be based on laws or bylaws. Under the principle of equilibrium, salaries must be determined by taking into consideration living expenses, salaries paid by the central government and other local governments, and private-sector salaries. The principle of equilibrium calls for a payment structure modeled after the central government and payment levels that reflect private-sector salaries in the geographical location in question. The governors and mayors implement salary revisions in response to recommendations made by the aforementioned personnel commissions. Those local governments that do not have personnel commissions determine their salaries in light of the decisions made by the central government and prefectural governments.

There are salary tables (pay schedules) for each type of work. Each salary table specifies several "grades" based on the complexity, difficulty, and responsibilities of different positions. Each grade also has different "steps" that indicate the levels of employees' skills. Thus, the total salary is determined by the grade and the step of each worker.

Salary tables must be created by each local government through compensation bylaws, but many local governments use tables similar to those used by the central government. While they could create their own salary tables, it requires much time and effort to come up with an appropriate payment structure. Therefore, they usually use salary tables of the central government, whose validity is generally not questioned, with any necessary adjustments.

Salary tables for local governments use the Laspeyres index to set the pay levels in the central government at 100 for corresponding positions that require similar educational background and experience. As a rule, local governments do not pay salaries that exceed this base value of 100. When the amount exceeds 100, the Ministry of Internal Affairs and Communications, which oversees the local public service personnel system, may ask the local government to provide an explanation. This prevents local-government finances from deteriorating as a result of an inordinate increase in labor costs. It also ensures that the payment structure is appropriately maintained and that payments are made in accordance with workers' duties.

In 2016, a personnel evaluation system, based on capability assessments and performance assessments, was introduced as a result of a revision in the Local Public Service Act. Capability assessments usually involve competency evaluations, whereas performance assessments use a management by objectives method. The evaluation results are reflected in promotion, wage increases, and bonus payments. They are also used for the purpose of employee training.

The Local Public Service Act also stipulates regulations regarding work duties of local-government employees. One such stipulation relates to obligations with respect to employees' specific duties, namely, obligations to follow laws and work-related orders and obligations to devote themselves to their duties. Another stipulation relates to obligations associated with employees' positions. Local-government employees must maintain credibility as a civil servant and keep information learned in the course of duties confidential. There are also restrictions imposed on employees' involvement in political activities and their employment with for-profit companies. They are also prohibited from engaging in labor disputes.

Appointing authorities may issue reprimands to those who are in violation of these work

regulations or who otherwise deserve such reprimands. In other words, local-government employees will not be subject to any adverse disposition unless they are in clear violation of regulations. This way, local-government employees can fully devote themselves to their duties without worrying about any arbitrary punitive measures.

The retirement age is set by each local government in accordance with that prescribed for central-government employees, which is currently set at 60. In fact, all local governments in Japan set their retirement age at 60 to keep in step with the central government. After retirement, workers are eligible for re-employment until 65, when they start receiving pension payments. However, discussions are now underway to extend the retirement age itself to 65. In the past, there were cases in which senior local-government officials found employment in affiliated organizations after retirement. In recent years, however, the number of such cases has significantly declined as local-government employees' involvement in affiliated organizations undergoes reviews and as the oversight of retiring employees becomes more stringent.

## Conclusion

The local public service personnel system has been broadly regulated by the Local Public Service Act. Each local government determines many of the specific work conditions within this broader framework. In practice, however, such work conditions very closely resemble those of the central government and those of other local governments, since the emphasis is placed on equal treatment of workers.

There are several advantages to this mechanism. For example, it costs less for a local government to use a system similar to that of the central government and other local governments than to implement an entirely different system on its own. As far as the central government is concerned, the Ministry of Internal Affairs and Communications can more easily provide guidance and advice with regard to appropriate personnel administration if all local governments have similar systems. There is also an added benefit in that exchange of personnel between the central government and local governments becomes easier if they have similar personnel management systems.

The central government and local governments frequently exchange employees with each other. Local governments, in many cases, dispatch younger employees for the purpose of training, while the central government, for the most part, sends senior officials to local governments. There are criticisms that this system allows the central government to control local governments by imposing its own employees. However, an argument could also be made that local governments are actively asking the central government to send officials because such a practice will confer various benefits.

Local governments are also exchanging employees among themselves. In recent years, local governments have sent many of their workers to the areas affected by the Great East Japan Earthquake. Personnel exchanges among local governments, if also carried out during normal times as need arises, could make the operations of local governments more efficient at a time when they are being forced to reduce the number of employees to the limit as administrative reform progresses. The fact that they have similar personnel management platforms means that they will easily be able to share human resources with one another.

## Synonyms

Accurate personnel data; Data management; Employee personnel data; Human resources data

## Introduction

Information is the lifeblood of any organization; it constitutes the basis for decision-making at all levels. Inaccurate or poor data can lead to inefficiencies whether in public or private sectors. Despite its importance to an organization, access to accurate data is often not given sufficient attention in the literature. There is a dearth of studies examining the reasons for poor data in public organizations.

Several studies agree that poor and inaccurate data can cost a significant amount to an organization both in terms of monetary and nonmonetary losses. Some estimates in the business world indicate the losses due to poor quality data can amount to $10 million a year. Despite these costs, Kim and Choi (2003, p. 70) suggest, "There have been limited efforts to systematically understand the effects of low quality data." Most efforts are directed at investigating and correcting errors in sophisticated computer and linear models. The impact of low-quality data usually depends of the nature and usage of the data (by citizens or end users).

Why is having and maintaining accurate personnel data (personnel Data refers to identifying data of an employee that is collected and stored by an organization. In the context of public higher education institutions, personnel data refers to information related to an individual's gender, race/ethnicity, faculty rank, department, full time/part-time status, academic appointment, etc.) so difficult for public organizations to achieve? Unfortunately, obtaining and maintaining accurate personnel information is not as easy as it would seem to a person outside a public organization. If the public organization has a large number of employees, the issue of obtaining accurate personnel information becomes more complex not only due to the quantity of information that needs to be captured but also due to the complexity of the organization and legal reporting requirements (Ashbaugh and Miranda 2002).

Is there a method for inputting the information in an official information system of record? Are there rules and legal guidelines that prevent such information from being obtained? Do public organizations need leadership and structure in place to ensure the collection of such information? Does the organizational culture support good quality data? In short, all of these questions are pivotal in obtaining accurate personnel information, most of which can be overcome by the organizational actions and business processes that are implemented. However, there will always be unresolvable difficulties in obtaining some personnel information due to legal statutes that prevent employers from requiring disclosure of certain information, ethnicity for example, from employees.

## Need for Good Quality Personnel Data in the Public Sector

Data quality is defined in the literature as "a set of characteristics that data should own (p.1)" (Scannapieco and Catarci 2002). These characteristics include accuracy, timeliness, completeness and consistency, meaningfulness, unambiguousness, and accessibility. The most detailed classification is provided by Wang et al. (1995), in which 25 different dimensions are used to classify data quality, of which accuracy tops their list. Given the importance of accuracy as a

measure of data quality, this study will focus on the causes for inaccurate data in the public sector with a special attention on institutions of higher education.

Studies often discuss the challenges of poor data (reduced efficiency, lower performance, lower morale, and turnover) in organizations (Kahn et al. 2002), but are not complete since they do not discuss what goes on from the time the data are input to receiving an output. If inaccurate data are produced, one is quick to point to the bad quality data. Garbage into a system leads to garbage out. Poor data quality is not the only reason; there are several other factors potentially leading to erroneous and inaccurate data. However, much of it remains as a "black box," a mystery. Through this study, the authors unpack the various reasons for inaccurate personnel data from input to output.

Personnel data are critical for many public organizations for workforce planning, analysis, operational reporting, as well as compliance requirements to local, state, and federal entities. Human Resources data, for the additional reasons of compliance purposes, must be reliable and accurate. However, public organizations often must overcome several obstacles to realize analysis and reporting useful enough for upper level administrators to make policy decisions and accurate enough to comply with governmental agencies. Furthermore, since public organizations are funded by taxpayers, employees' salaries, titles, and departments can be disclosed as public information. Due to this level of transparency, it is imperative that salary data be as accurate as possible to avoid public backlash because salaries are perceived to be too high or too low. If inaccuracies are publicly revealed, this could trigger an audit and can result in poor public relations as well.

Public organizations are no different from their private or nonprofit organization counterparts where employee hiring, retention, and turnover are concerned. With a decrease in funding always being a possibility, public organizations need to be more flexible and adaptable in their employee recruitment and retention strategies. Operational data can be used to determine budgets for each department, salary raises for employees, hiring for diversity goals, turnover due to retirement, shortfalls in personnel requirements, and loss of personnel through attrition from reasons other than retirement. During tough financial times or when the organization needs to re-staff with new or updated skill sets, personnel data can be used to determine if certain early retirement programs are feasible for the organization to utilize. Throughout this research, the authors will discuss the obstacles and possible solutions for an organization to obtain and effectively use Human Resources data toward these ends.

## Barriers to Good Quality Personnel Data

There are several barriers resulting in poor quality personnel data. We classify these into internal and external. Internal barriers are further classified into: (a) information systems, (b) human resources culture, (c) organizational culture, (d) data ownership, and (e) reporting. External barriers comprise of (a) legal mandates, (b) stakeholders, and (c) business processes. Figure 1 depicts the various barriers to good quality data.

## Internal Factors

### Information Systems

With any type of large public organization, there will be a substantial enterprise information system for human resources. An Enterprise Resource Planning (ERP) system is defined as "configurable information systems packages that integrate information and information-based processes within and across functional areas in an organization" (Kumar and van Hillegersberg 2000, p. 23). While having their origins in the business world, ERP systems have gained popularity in university settings worldwide. Most popular ERP systems used in universities are Oracle, SCT Banner, PeopleSoft, and SAP. These systems make data accessibility and controls easier. Thus, the primary function of an ERP is to enhance efficiency and performance of an organization by streamlining the decision-making process.

**Public Personnel Data in Public Organizations, Fig. 1** Barriers to good quality data

Organizations are thus choosing ERP systems over Human Resources Information System (HRIS) as they fully integrate all operations into one package. According to Ashbaugh and Miranda (2002, p. 10), "the value of ERP was to bring financials and HRMS under a single vendor and common technology standards" thus making HRIS a subset of the ERP software. HRIS is defined as a "technology based system that is used to acquire, store, manipulate, analyze, retrieve, and distribute pertinent information regarding an organizations human resources" (Tannenbaum 1990, p. 27). HRIS in the public sector is used mainly for information gathering and record keeping instead of transformational activities such as re-engineering of HR or strategic activities within the organization (Kovach and Cathcart 1999; Reddick 2009). However, there are several challenges involved with ERP systems, the biggest being cost.

Prior to Y2K, many of these information systems were not integrated with other systems such as finance, budget, facilities, and, in the case of universities, student information systems. Since these systems were stand-alone and isolated, the cultures within which these systems were "siloed" in functionality. Each silo specialized in only their area of functional concern or expertise. Human Resources, for example, entered personnel information into the human resource information system unconcerned or unaware of what other employee data was being entered into the finance, budget, facilities, or student information systems. Additionally, internal business processes during this timeframe still utilized paper forms with little or no electronic input from lower level employees who interfaced with the information system.

To keep information systems operational before Y2K, many organizations hired programmers that had already retired from the private sector to modify enterprise information systems so that their system would not collapse during the date change from 1999 to 2000. Programmers who supported these types of mainframe information systems tended to be an older generation of programmers that were accustomed and trained in programming languages that had become obsolete (i.e., COBOL, NATURAL). Unfortunately, when large public organizations hired programmers to "patch" the older systems to remain operational, they inadvertently promoted the silo organizational culture. The personnel in functional areas such as human resources were not forced to change their business processes to work in an integrated fashion and thus entrenching the silos. Eventually, even these large public organizations were forced to transition to an integrated system when older mainframe systems became

unsupported by the vendors. Unfortunately, this does not mean functional areas did not attempt to restructure the new integrated information system to match their older style of business processes. For many public organizations, this led to turmoil because the new system was not compatible with older business processes.

In many cases, public organizations pass through a series of transitions, which would involve retraining or replacing key personnel. With these types of transitions, an organization loses institutional memory, which can lead to gaps in organizational information and capability when older systems data are migrated to the newer integrated information system (Mnjama and Wamukoya 2007). Additionally, vendors who sell an enterprise system do not customize an information system for a particular client without a great deal of expense. When the customer chooses an information system, they should choose one that will carry out the functionality of what the organization requires. Otherwise, the organization will need to restructure and embrace their business processes to fit the information system.

With the new advent of integrated information systems, the potential problems with data entry issues have increased. The first and foremost problem with data entry issues comes from employees who have the ability to self-report their own data. While there are many areas that can be audited by human resources and IT in the component (or module) of an integrated information system, other variables such as date of birth, gender, ethnicity, and, to a lesser extent, contact information (i.e., telephone number, physical address, etc.) can become problematic. When data becomes an unreliable source of information for reporting, using the data for operational decision-making becomes untenable.

In addition, public organizations will usually have different software packages for various business processes (e.g., payroll). These software packages will typically require additional modifications to the host information system to operate successfully. Since there is no federal mandate for public organizations to buy or use the same information systems and software packages, the combinations used by public organizations can be overwhelming, rendering standardization among public organizations, particularly higher education institutions that are part of a larger system, nearly impossible. The type of information system chosen by an organization is often dictated by the following parameters:

1. Cost of the information system (what can the organization afford)
2. The capability of the employees of the public organization (can they support the information system?)
3. Business processes (how willing is an organization to change business processes to fit an information system)
4. Organizational culture (what politically can be supported in the organization)

These four factors will vary greatly among public organizations, resulting in a large number of combinations of information systems and software packages used for human resources data. Even with organizations that use similar information systems, the manner in which those systems are used can vary widely from one organization to another.

### Human Resources Culture

The role of human resource administrators and employees is to conduct the following functions: hiring/recruitment, job analysis, employee planning and appraisal, training, compensation and benefits, and succession planning, among others. Contending with data issues is another matter entirely. There is always a shortage of HR personnel who have information technology skills. Working with data requires human resources personnel to be more analytical when entering in data into an information system as well as ensuring the data is accurately updated when hiring an applicant or when an employee is promoted or changes job assignments (Ban 2005; Mahapa and Chirasha 2012).

There is also the issue of how human resources are perceived by the organization itself. If the perception is not positive, this can lead to low morale within the human resources department,

which can potentially lead to a high degree of incomplete or incorrect data being entered into the system. Departments that perceive (either correctly or incorrectly) that human resources are incompetent will begin to question the credibility of those responsible for the data. An example would be a state auditor who declares that a university has no full-time faculty because they do not understand that universities consider faculty on nine-month contracts as full-time faculty. The auditor has lost credibility from university employees by not understanding the business processes they were sent to audit. The loss of political power can have several consequences not the least of which can result in departmental administrators finding themselves under increased scrutiny. Data produced by the department will be questioned because the organization has lost faith in the credibility of the department's data entry capability and the effectiveness of its business processes.

Often, human resources departments are dependent upon employees external to their department for technical support or analytical reporting requirements. Employees themselves are often responsible for inputting their own information into a human resources database. Variables that can frequently complicate information accuracy are ethnicity, address, and educational background. In the modern age, obtaining an accurate address is becoming more problematic since employees (and universities' students) can conduct all of their business transactions online. Transactions that use to require a physical mailing address, such as maintaining benefits or issuing checks, are now conducted electronically. Thus, when an organization needs to use address information for operational analysis (e.g., GIS), the analysis can have gaps in the data, which results in incomplete results.

Another approach is to outsource data entry or entire human resource functions to outside vendors. Contracting human resources to outside vendors can pose several challenges as shown by Coggburn (2007) in the case study of Texas Health and Human Services outsourcing their HR functions to Convergys, a private firm. The different values and interests between public and private sector gave rise to several unanticipated problems. For example, 80 employees received warrants instead of paychecks and others received inaccurate payments. In another case in the mid-1990s, Nortel Networks contracted to a third party, which led to a host of data entry errors within the Human Resource system Resumix. These data entry errors necessitated the creation of an application built in Filemaker Pro designed to audit and clean the data and to produce profiles of new college graduate applicants who would receive multiple job offers from different departments. After the data was cleaned, the profiles generated were accurate over 67% of the time, which proved valuable for recruiters who could then pursue new graduates that fit the profiles provided by the hiring managers (Valcik 2015).

Other examples of problematic information can range from employee health insurance to faculty rank and tenure attributes maintained by a department other than human resources. While this may in theory make life easier for human resources departments, this also makes them vulnerable to political forces that would isolate human resources departments and limit their involvement in policy decisions. Without the ability to extract and analyze the data accurately, the human resources department is operating blindly, which can severely limit their effectiveness and decision-making capacity on the organization (Kovach and Cathcart 1999).

As Daft (1995) would indicate, organizational life cycle will also factor into data integrity. With expanding public organizations, data integrity becomes a greater concern as more data entry is necessary to keep pace with new hiring, promotions, etc., all of which is dependent upon departmental input into the information system. Without participation by the departments, the gap between what is needed and what is occurring with data entry will widen and shrinking this gap will take more effort and more money.

### Organizational Culture

"Because we have always done it this way." The quote identifies stagnation in a public organization. Stagnation or inertia can be a major obstacle if business processes are never re-evaluated or are deemed "good enough" by the public

organization. This culture or mindset can be detrimental to any successful information system implementation (Kovach et al. 2002). Existing personnel and business processes will be difficult to alter with a new personnel information system. Instead of using the capabilities of the new information system, an organization is likely to use the new system like an electronic filing cabinet, which will not address current organizational inefficiencies.

Organizational culture can act as a barrier to the successful assimilation and integration of new technology. Without motivation to input information correctly, the organization will see a drift in how data should ideally be recorded compared to how the data are actually being input into the information system. Data entry will remain a lower priority for the departments that do not understand why the data are important for organizational operations. While some departments require data to be accurate (which is their agenda), other departments view data cleansing or accuracy as a lower priority since they have different priorities. This decoupling "pushes" the organization out of alignment, which results in organizational drift.

With public organizations, there will always be some increase in organizational drift when new technologies appear for two reasons. First, existing employees will need to acquire new skills, which necessitates a learning curve that can be quite substantial for some employees. Second, new technology may require an organization to hire new employees. The hiring process can be time consuming. The new employees will then need to acclimate to their new organization, which takes additional time.

Employees who cannot, or will not, learn new technologies or adapt to a new organizational culture may be candidates for an early buyout or phased retirement program, which would benefit both the employee and the organization long term. However, to determine the true status of employee retention and hiring, accurate data are required. All of the issues identified operationally impact a public organization's financial well-being as well as their operational efficiency and effectiveness.

### Data Ownership

In the organization, there must be a champion that will ensure the data being entered are correct and verifiable. The issue of data integrity comes down to data ownership and accountability (Vosburg and Kumar 2001). In larger public organizations, there is sometimes confusion over what department should own certain data entry aspects. For example, should the data be entered by Payroll, Human Resources or, in the case of higher education institutions' faculty, the Provost's office? The question of data responsibility is an issue of organizational command and control issues with business processes. Additionally, the organization will need to ascertain which department in the organization will have responsibility to audit human resources data. In most public organizations, there is a department usually tasked with reporting responsibilities separate from the internal audit unit. Auditing human resources data can be conducted by either one of these units or by both working together.

Ownership of personnel data and determining who is responsible for keeping data current in the enterprise information system can be daunting. In many cases, an information system is seen as an electronic filing cabinet as opposed to being used as a tool to collect data and operationalize for the decision-making process. However, with the new ERP systems, data ownership is seen as the responsibility of everyone who has access to HR data. In the past, the IT department was solely responsible for maintaining the integrity of the data – this is certainly changing with evolution of integrated systems. According to Vosburg and Kumar (2001, p. 28), "Ensuring that all stakeholders of an ERP system understand their responsibilities with respect to maintaining data integrity will lead to a better quality system. Data that is a part of an ERP system belongs to an organization and not to any individual department or user." Despite the broad ownership that ERP systems offer, there are turf battles for data ownership and the politics of it can impact the quality of data. Specifically, there are three types of power struggles and organizational control struggles: entities who want to have ownership and responsibilities, entities who are attempting to shirk

ownership and responsibilities, and entities who are ordered to take ownership and responsibility for personnel data. Ultimately, whoever is assigned to update such information will need to audit the data entry process to ensure data integrity. Without data integrity, the data will become unusable for accurate analysis, which in turn can lead to erroneous decision-making.

### Reporting

Reporting and performing analysis of data has many potential pitfalls that analysts and administrators should be aware of when producing files or reports. Variables submitted according to certain criteria to a federal or state agency to achieve one policy objective might be translated and utilized in a completely different manner than for what it was originally intended. While federal or state agencies provide guidelines for the data they require, the definitions of those requirements may be open to interpretation. Certain variables, if not clearly defined by the state or federal agency, could be reported in many various ways depending on how different public entities initially captured the information. This will lead to data that are inconsistent if state or federal agencies attempt to compare organizations based on these types of data (Akbulut-Bailey 2011). For example, a state agency may require a public entity to report contracted salary rates for employees. However, a public entity may instead report actual salaries paid, including part-time salary rates, because of the limitations of their enterprise information system. Thus, the state agency is assuming (incorrectly) that the amount being reported for salary is the contracted amount and may draw the erroneous conclusion that some individuals are grossly underpaid. The differences in reported and expected reported value allow drift to occur from the ideal to what is actually occurring. A public entity should assess what definitions are being used as well as how the information is being populated in the enterprise information system. This will allow for the information to be consistently stored and accurately extracted for reporting purposes.

Another challenge to data integrity is when employees add, delete, or update their own information. It is virtually impossible to ensure the employee enters all data according to proper business procedure. Some data elements, particularly ethnicity, will be unverifiable due to how the employee categorizes themselves and because of federal and state statutes, which prevent the organization from requiring disclosure of certain information. Furthermore, if the data are not integrated across departments, it can lead to erroneous reporting with different departments producing different results for the same query (Guan et al. 2002).

## External Factors

### Legal Mandates

Legal mandates can pose an obstacle to an organization for obtaining accurate human resources data (Ashbaugh and Miranda 2002). For example, federal law prohibits a public organization from requiring employees to disclose their ethnicity or gender. Additionally, information of this type is impossible to independently verify, and collecting data that does not have direct relevance to one's job can pose challenges. Thus, a conundrum exists where public organizations are mandated to become more diverse but are not allowed to require employees to disclose the information necessary to determine if diversity efforts are working. According to EEOC (n.d.) "Employers need to provide employees the opportunity to self-identify their own ethnicity. If an employee then refuses to do so, employment records or visual observation must be used" (http://www.eeoc.gov/employers/eeo1survey/faq.cfm). This can further complicate reporting and data accuracy as HR is now left to guess the race or ethnicity of employees that choose to withhold their racial identity. Other information required by public organizations to verify legal dependents for benefits (e.g., marriage certificates) could possibly prove to be a point of litigation because marriage certificates frequently have religious affiliations printed on them, another protected category of personal information. As stated by the United States Equal Employment Opportunity Commission:

> Pre-Employment Inquiries and Religious Affiliation or Beliefs
>
> Questions about an applicant's religious affiliation or beliefs (unless the religion is a bona fide occupational qualification (BFOQ)), are generally viewed as non-job-related and problematic under federal law.
>
> Religious corporations, associations, educational institutions, or societies are exempt from the federal laws that EEOC enforces when it comes to the employment of individuals based on their particular religion. In other words, an employer whose purpose and character is primarily religious is permitted to lean towards hiring persons of the same religion. This exception relieves religious organizations only from the ban on employment discrimination based on religion. It does not exempt such organizations from employing individuals due to their race, gender, national origin, disability, color, and/or age. Other employers should avoid questions about an applicant's religious affiliation, such as place of worship, days of worship, and religious holidays and should not ask for references from religious leaders, e.g., minister, rabbi, priest, imam, or pastor. (EEOC 2015)

A public organization should be aware of the United States Equal Employment Opportunity Commission guidelines and ensure those guidelines are followed to avoid potential legal action from applicants and employees. Additionally, there are new initiatives regarding diversity and affirmative action in the workplace that require reports to comply with state and federal mandates. For public universities, the Integrated Postsecondary Education Data System (IPEDS), managed by the National Center for Education Statistics (NCES), requires colleges and universities to report salary, faculty/staff status by Standard Occupation Code (SOC), ethnicity and gender on a regular basis. These reports are made public through NCES and can be accessed by the public (NCES 2015; Renn and Lunceford 2004). Other state initiatives, such as West Virginia H.B. 439 (2015), use data reported by state agencies to determine comparative salaries for certain types of positions (West Virginia Legislature 2015). Through the new state personnel database system (OASIS) and existing personnel reports, data are used by state agencies to determine how personnel at various levels should be compensated.

## Stakeholders

In a public institution, there are several internal and external stakeholders a human resources department works with when collecting and reporting data. Internal stakeholders are usually employees in other departments who may see personnel data as simply a business process. The personnel that typically input information into an information system are secretaries and administrative assistants who are frequently tasked with inputting various departmental transactions and completing other accounting duties. These types of employees are mostly concerned with getting the information complete enough to satisfy the human resources department so empty positions can be filled or existing employees can be promoted. Other internal stakeholders at a public university are administrators, students, faculty, and alumni. However, personnel data can be of importance to external stakeholders as well. External stakeholders include citizens, parents, board members, legislators, funding agencies, community leaders, and employers.

Guan et al. (2002) argue that higher education is an ever-changing environment requiring leaders to make decisions that require sound data, which can then be presented to stakeholders who impact institutional direction and policies. However, studies indicate the poor utilization of data by upper administration. In an exploratory study of human resources systems in a large public university by Beadles et al. (2005), the authors found that over three-fourth (80%) of the HR directors agreed that the information produced was underutilized by the upper administration and only 40% agreed that the information system increased collaboration and coordination across departments and administrators.

## Business Processes

Business processes can form an external barrier for human resources organizations if another government agency's processes will not integrate with the existing human resources information system. There may be an obstacle if a government agency requests information that is unobtainable due to the limitations of the current information system

(Mahapa and Chirasha 2012). Business processes can also form an external barrier if one business process from a state agency conflicts with a federal reporting mandate. The information system may only be able to capture the information to comply with federal mandates, which causes an obvious conflict with the business process of the requesting state agency.

Salary is a good example of how information systems can be a barrier to providing accurate data. For example, a government oversight agency requires a state university to report salary of faculty on a contracted basis. However, the university captures only what is paid to the faculty member due to the limitations of the information system. Additionally, the oversight agency wants the information reported in 12-month time spans when the university contracts faculty on a 9-month basis. Two conflicting business processes from different agencies have thus caused an external barrier for both agencies.

## Organizational Interventions

The obstacles discussed can skew the quality of data, which will invalidate results from producing meaningful and actionable information. If the obstacles are not overcome by the organization, the data could be unreliable for the operational decision-making process. The positive benefit to having clean data are an organization can use the data to make informed decisions as well as use the data for strategic and operational planning. What can an organization do if their personnel data has issues in their information system? Several factors will determine whether an organization is able to correct the issues found in an information system: auditing, leadership, streamlining, and data entry controls.

### Auditing

An organization can intervene by having regular audits in place to check for data integrity in the enterprise information system. An organization can also replace personnel with those who have the analytical abilities to develop a series of edit checks on the data, which can be sent to the functional areas to correct. If the organization is required to produce federal and state reports, it would be ideal to build in pre- and post-implementation audits to ensure data quality and accuracy. This will allow the information to be corrected in the system before it is sent to federal or state officials for certification.

A public organization should assess its business practices at regular intervals to determine how human resources data are being collected and reported (Bargerstock 2000; Nutley 2000). Areas of operation that are vulnerable to, or have experienced, data entry issues should be reviewed as soon as possible so that data entry controls can be implemented to limit data entry errors. The data entry controls can include modifications to the user interface that will either validate when a user attempts to save a record or an application that checks for the validity of data that has been entered (i.e., address information). Many enterprise information systems now have the capacity to control free-formed data entry fields to limit data entry errors. That being stated, there is still a need to have business processes documented and evaluated to ensure the quality of the data.

The organization will need to evaluate its employees' knowledge, skills, and abilities (KSA) versus the organization's KSA requirements per job position for operational purposes. It is important for the organization to understand the requirements of each job position and the performance level of each position in the organization. A thorough assessment will produce a gap analysis documenting present KSAs per employee (reality) versus organizational KSA requirements (theory). Inevitably, there will be organizational drift between ideal KSA levels and actual employee KSA levels. An organization can attempt to close the gap between reality and theory, but, due to hiring laws, existing personnel, and available job candidates, there may be a limit on how much this gap can be reduced.

### Leadership

Does the organization value the accuracy of personnel data? A better question might be which

parts of the organization value accurate personnel data? Large, complex organizations often hold different values on personnel data within their own organization. Some departments may covet the information highly while other departments do not understand why the information is important or how the information impacts their areas of operation. Unless the organization's top leadership provides guidance as well as directive that such information is critical to organizational operations, the motivation to input, maintain, and update personnel information will be minimal among the various departments.

Support from the top leadership is documented as the most important factor for success in HRIS (Kovach and Cathcart 1999; Ngai and Wat 2006). Without proper leadership in the appropriate areas of the organization, human resources data will most likely experience data integrity issues throughout the information system. Without organizational leadership to develop and implement mechanisms to insure data integrity, data standards and controls will be nonexistent if the area responsible for data entry is not held accountable when or if data entry issues occur. A leader empowered to make organizational decisions in a positive manner is critical for accomplishing accurate human resources data. In contrast, a leader who refused to make organizational decisions in regard to human resources data or makes poor organizational decisions will be a liability to the organization.

If no one in an organization is assuming responsibility for or control of data entry and maintenance, leadership may be an issue. A good leader can reorganize their department or area and add additional resources to insure that data entry and maintenance are valued. An effective leader can recognize the need to hire someone in the human resources department with technical abilities to analyze the data on a regular basis as well as perform audit checks and produce reports (McCullough and Sims 2012). A human resource employee with technical skillsets can interface more easily with personnel inside the human resources department, information technology, and in other departments reliant upon personnel information.

An ineffectual leader will not acknowledge or address data entry problems. If the organization discovers it has an ineffectual leader, the organization has two choices. First, the organization can issue a directive to the current leader in an attempt to improve the situation. Good directives can make a difference if a leader is willing to change in a positive manner. Secondly, the organization can replace a leader if it is unlikely that new directives will make a positive impact on data entry or maintenance of data. An ineffectual leader may need to be replaced if they lack the knowledge, skills, or abilities to restructure or address current shortfalls with data entry or maintenance of personnel data.

### Streamlining Business Processes

When re-evaluating existing business processes, new methods or technologies can be utilized to increase efficiency or effectiveness of data entry processes in information systems. Often an organization will retain a certain business process because, at one point, this old process was logical or conformed to a pre-existing enterprise information system but now is no longer an effective or efficient method on the new enterprise information system. One common way to improve effectiveness and efficiency is to automate certain processes. Another common business process is converting paper forms to an online form, thus improving accuracy and the timeliness of the approval process (McCullough and Sims, 2012).

If data entry and data maintenance issues consistently occur within a particular department, an organization can transfer duties and data ownership to one or more areas of operation to reduce errors. Another solution could be recombining previously segmented ownership and duties into a single entity if the situation warrants an organizational change. Finally, the enterprise information system, like ERP itself could be modified to use drop down boxes and validation tables for data entry personnel. If a data entry employee is presented with a small menu of viable options, invalid responses can be eliminated and data entry errors can be reduced. This approach also allows for a thorough audit to be

conducted since the only answers that can exist are those on the validation table.

## Conclusion

The key purpose of this descriptive study is to examine the need for accurate personnel data, identify barriers, and provide solutions to supply good quality data that can be used for sound decision-making. Good quality data are the backbone of any organization and impacts institutional decision-making capacity, which in-turn impacts policies at all levels of an organization (Strong et al. 1997). The framework presented in this study has not been explored in the public sector. Hence, we suggest future researchers to use empirical data to test the internal and external barriers to good personnel quality data presented in this study.

Thus, the importance of accurate human resources data cannot be underestimated. The data can be used for operational and compliance purposes since public entities are responsible for reporting employee data to the federal and state agencies. Any sizable public organization will need to have an information system to manage human resources information. However, there are several challenges in getting good quality data as indicated by this research. HRIS in the public sector is often used for data collection and storage more than for strategic decision-making. According to Guan et al. (2002, p. 174), "what is needed in developing effective information support for institutional decision making is a 'paradigm shift' that reconceptualizes information systems as critical to decision making."

There is very limited research in the public sector that examines the issue of data accuracy within the human resources function. Public sector organizations across local, state, and federal levels are increasingly relying on personnel departments for data related to workforce planning and analysis, recruitment, professional development, performance evaluation, payroll, retention, and attrition. To meet these demands in an efficient and cost-effective manner, public sector organizations are looking to information systems to automate existing processes. HRIS is most commonly used in public organizations, but due to its limitation of fully integrating all operations into one package, larger organizations (e.g., public universities) are switching to ERP systems. Despite the move to more powerful systems, there continue to be challenges faced by human resources departments, which this study highlights. Furthermore, having access to good quality data can improve the competitiveness of public sector organizations as they continue to vie with the private sector for talent.

Unfortunately, there are only a limited number of information systems commercially available to public organizations. All information systems will have limitations and almost all will need to have modifications made to be compliant with state, local and possibly federal reporting guidelines. There will never be a generic information system that functions as a one-stop information system workable for every public organization. Every public organization is responsible for reporting to state and federal agencies with other public organizations needing to report information to county governments or municipalities. When state or federal agencies compare data files from public organizations, the variables may be very different from one organization to another since the definitions and manner in how the information system is configured can be different. Having consistent definitions and data entry protocols are important to ensure data accuracy across public organizations. Furthermore, having leadership that is knowledgeable and committed to promoting a culture of maintaining data accuracy and accessibility is key to improving organizational performance and decision-making.

# Public Policy and Bureaucracy

Maryam Omolara Quadri
Department of Political Science, University of Lagos, Lagos, Nigeria

## Synonyms

Policy and administration; Specialized institutions of the state and policy implementation

## Definition

Public policy and bureaucracy refer to the interaction between public bureaucracy and public policy in a modern society and how both shape and influence each other in the political process.

## Introduction

Public policy denotes the activities of government directed to achieve the stated objectives of government in many policy areas. Implementation is a crucial aspect of the policy process and so makes the bureaucracy very critical. Effective bureaucracies are supposed to ensure that goals of governmental policies are implemented. Bureaucracy for Max Weber was the most advanced form of human organization that society had devised and the most rational means for the performance of collective tasks, especially those requiring large-scale organization. Because of the complexity of modern public administration, the role of the bureaucracies (otherwise known as public administrators) has transcended mere implementation of policies to participating in policy formulation. This discourse focuses on the nature of bureaucracy and its intersection in policy formation. It analyzes how bureaucratic influence shapes public policy.

## Bureaucracies and the Policy Process

The appointed officials dealing with public policy and administration are often collectively referred to as the "bureaucracy." Their function is to assist the executive in the performance of its tasks, as is suggested by the terms "civil servants" and "public servants" (Howlett et al. 2009). Max Weber (1947), a German sociologist regarded bureaucracy as a universal social phenomenon, and the means of carrying "community action" over into rationally ordered "societal action." Weber thought of bureaucracy as a body of appointed officials, a definite and distinct group whose work and influence could be seen in all kinds of organizations. Weber identifies bureaucracy as the dominant organizational form in a legal and rational society.

As analyzed by Wren and Bedeian (2009, p. 230) Weber's ideal bureaucracy is based on:

> Legal authority as contrasted with that which rests on either tradition (custom) or charisma ("the gift of grace"). As developed by Weber, legal authority stems from rules and other controls that govern an undertaking in the pursuit of specific goals. Managers are given the authority to interpret and enforce these rules and other controls by virtue of their position. Obedience is not owed to a person but to the impersonal authority of an office. Thus, authority adheres to specific positions rather than to individuals. This is necessary if authority is to outlast the tenure of individual officeholders.

To Poocharoen (2013), the word bureaucracy can be referred to in two ways. First, bureaucracy as a form of organization, where there are structures, rules, resources, and goals. The organization can be in any sector: public, private, nonprofit, or a combination of them. Second, bureaucracy as administrative machinery that is part of the government. Its primary function is to execute the will of the state or in other words to implement public policies. Its major criticisms (red-tapism and delay administration) notwithstanding, Max Weber is of the view that bureaucratic forms of organization are more efficient than other systems of administration. The decisive reason for the advance of bureaucratic organization has always been its purely technical superiority over any other form of organization, precision, speed, unambiguity, knowledge of the files, continuity, discretion, unity, strict subordination, reduction of friction, and of material and personal costs – these are raised to the optimum point in the strictly bureaucratic administration, and especially in its monocratic form. So, in many political systems, power of bureaucratic organizations looms very large and impact much on their policy processes.

Bureaucracy as implementers of public policy (objectives of the state) occupies a critical position in the political decision-making of governments. The reason why Peters (2015) notes that the majority of the policy work of government is done through the organizations that constitute the public bureaucracy. As Fry and Raadschelders (2014) observe, the history of public administration in United States and other countries illustrates that, increasingly, there are bureaucratic influences not only on the implementation of public policy but also on the formulation of public policy. Reasons for this are not far-fetched; the complexity of public policy continues to increase, and the expertise and sheer numbers of

bureaucrats outpace that of elected officials. Peters and Pierre (2007) while acknowledging that the principal activity of public administration is implementing laws also observe that there are also a range of other important activities carried on in these public organizations. The laws passed by legislatures are often general and require elaboration by administrators. Bureaucracy comes in very important as the secondary legislation prepared by the bureaucracy not only makes the meaning of the laws clearer, but it permits the application of the expertise of the career administrators to policy. Nicholson-Crotty and Miler (cited in Fry and Raadschelders 2014, p. 54) analyzed state legislator's perceptions of bureaucratic influence on legislative outcome to demonstrate that the effectiveness of bureaucratic influence is greater when (1) legislator's terms are limited, (2) legislators and the executive are not divided by political party, and (3) bureaucratic agencies are politically independent from the executive. Hence, bureaucracy is able to influence the path of policy formation.

What then constitute a public policy? What is the process of its enactment? It is apposite to examine the concept of public policy and the process through which it emerges in order to understand the interplay between public policy and public bureaucracy.

Anderson (2011) defines public policy as a relatively stable, purposive course of action or inaction followed by an actor or set of actors in dealing with a problem or matter of concern. According to Anderson, there are several implications of this concept of public policy as defined above. First, the definition links policy to purposive or goal-oriented action rather than to random behavior or chance occurrences. Public policies in modern political systems do not, by and large, just happen. They are instead designed to accomplish specified goals or produce definite results, although these are not always achieved. Proposed policies may be usefully thought of as hypotheses suggesting that specific actions be taken to achieve particular goals. Second, policies consist of courses or patterns of action taken over time by governmental officials rather than their separate, discrete decisions. Third, public policies emerge in response to *policy demands*, or those claims for action or inaction on some public issue made by other actors – private citizens, group representatives, or legislators and other public officials – upon government officials and agencies. Fourth, policy involves what governments actually do, not just what they intend to do or what officials say they are going to do. Fifth, a public policy may be either positive or negative. Some form of overt governmental action may deal with a problem on which action is demanded (positive), or governmental officials may decide to do nothing on some matter on which government involvement was sought (negative). Finally, public policy, at least in its positive form, is based on law and is authoritative. Thus, public policy has an authoritative, legally coercive quality that the policies of private organizations do not have (Anderson 2011, pp. 7–9). Howlett et al. (2009) observe that a government's *capacity* to implement its decision is a significant component of public policy and a major consideration affecting the types of action that government will consider.

Cairney (2012) expresses the view that the policy cycle (stages model) is the best known way to organize the study of policy-making. It divides the policy process into a series of stages, from a notional starting point at which policymakers begin to think about a policy problem to a notional end point at which a policy has been implemented and policy-makers think about how successful it has been before deciding what to do next (Cairney 2012, p. 32). So, the policy-making process begins with awareness of a problem. It involves the process of identifying, defining, and specifying policy problem. This is followed by agenda setting which refers to the process by which problems come to the attention of governments and deciding on which issues deserve the most attention and defining the nature of the problem. Policy formulation denotes how policy options are formulated within government. Anderson (2011) refers to it as developing pertinent and acceptable proposed course of action for dealing with public problems. It involves identifying the technical and political constraints on state action (Howlett et al. 2009). At the policy formulation stage of the policy cycle, problems,

proposals, and demands are transformed into government policies and programs. The policy decision that emerges from the formulation and adoption stages sets off a long and complex chain – which is refers to as the implementation process (Theodoulou 1995).

Policy implementation involves establishing or employing an organization to take responsibility for implementation, ensuring that the organization has the resources (such as staffing, money, and legal authority) to do so, and also making sure that policy decisions are carried out as planned. At the minimum, implementation includes (1) adequate personnel and the financial resources to implement the policy, (2) the administrative capacity to achieve the desired policy goals, and (3) political and judicial support (from the legislative, executive, and judicial wings of the government) for the successful implementation of policy (Sapru 2012).

So, implementation relates to how government put policies into effect; in other words, it is the application of policies to problems. It is important to know that the nature of policy determines the types of projects and programs and structure the implementation process (organizational arrangement and procedures).

Policy evaluation refers broadly to the stage of the policy process where an assessment is made of how a public policy has actually performed. Evaluation becomes an objective assessment of a policy being implemented (Howlett et al. 2009; Anderson 2011; Cairney 2012).

Policies are continuously transformed by implementing actions that simultaneously alter resources and objectives (Majone and Wildavsky 1979). It is important to stress that the stage of policy implementation is very critical in the policy process. This is basically because without application, policy will have no effect. The effectiveness of modern government is measured by the impact of its developmental policies. It becomes difficult to measure the effectiveness of governments if policies are not implemented; in other words, failure of implementation of critical policies to affect or/and transform the lives of the citizens can have serious implications for any government.

Howlett et al. (2009) note that the bureaucracy's power and influence are based on its command of a wide range of important policy resources. As they must engage with policy process, bureaucracy brings with them a number of resources (Peters 2015). One significant resource that bureaucratic agencies possess is their *expertise*, and for policy-making, the expertise may be of two sorts: the actual technical knowledge of the policy domain within which they work and their knowledge of their clients and conditions in the policy domain that they serve. That bureaucracy is a repository of a wide range of skills and expertise is what makes it a premier organization in society. Rourke (1969) notes that within its own ranks, public bureaucracy numbers a wide variety of highly organized and technically trained personnel whose knowledge and skills powerfully influence the shape of official decisions. A second major resource for bureaucracies in the policy-making is that they are the masters of the *process*. *Stability* is the third resource for bureaucracies. The argument is that public organizations persist and have some collective memory that can guide their actions and also inform other actors in the process. The permanence of the bureaucracy and the long tenure of its members often give it an edge over its nominal superiors, the elected executive. The fourth resource for organizations in the public bureaucracies is their own *political resources* (Peters 2015; Howlett et al. 2009). Rourke (1969, p. 3) notes that there are many issues especially in foreign policy, where decisions are made by high public and "private" officials in virtually public opinion and interest-group opinion vacuum. In such areas, bureaucrats are in a commanding position to influence the shape of public policy since they possess not only the professional skills necessary to devise rational courses of action but also the ability to structure the public attitude and preferences to which their policy decisions are in theory supposed to respond. In such situation, executive agencies may come close to exercising monopoly power over the development of public policy. In a similar fashion, many policy issues in contemporary societies will require much of the expertise and professional skills of administrators in specialized

policy areas. The resources at the disposal of bureaucracies provide unrivalled opportunities for them to perform some powerful functions in the policy process and thus placed bureaucracy in advantageous position in the modern society.

## Bureaucrats and Policy Implementation

A clean or clear-cut separation between policy formulation and implementation is not conceivable as policies can be reformulated at the stage of implementation. In Anderson words "policy is being made as it is being administered and administered as it is being made." According to Parsons (1995), policy-making does not come to an end once a policy is set out or approved. Policies are continuously transformed by implementing actions that simultaneously alter resources and objectives (Pressman and Wildavsky 1984). Perhaps, this is made possible when implementers are confronted with ambiguous, vague, and broad objectives that inevitably leave them with no option other than reinterpreting policy idea. Anderson gives credence to this when he expresses the view that administrative agencies often are provided with broad and ambiguous statutory mandates that leave them with much room for choice in deciding what should or should not be done on some matter (Anderson 2011). Even under ideal circumstances, implementation as viewed by Smith and Larimer (2017, p. 165) is not easy; a law that is fairly unambiguous about what should be done is invariably light on the specifics of how to do it. Agencies formally fill in these details through the process of formulating rules. This explains why he advances that the study of policy implementation is concerned with the agencies and officials involved, the procedures they follow, the techniques (or tools) they employ, and the political support and opposition that they encounter (Anderson 2011, p. 209). There is also the belief that policy shapes implementation. Policy content shapes implementation by defining the arena in which the process takes place, the identity and role of the principal actors, the range of permissible tools for action, and of course by supplying resources (Majone and Wildavsky 1979). In essence, the nature of policy determines the intensity of politics involved including the decision to allocate resources for a successful implementation. Does the age-old dichotomy between politics and administration still hold in contemporary society? Can politics and administration be considered separate or distinct from each other? It is well-known that a classic feature of the traditional literature of public administration was the notion that politics and administration were separate and distinct spheres of activity. The *Wilsonian (1887)* tradition focused and devoted energy into arguing for the separation of politics and administration. It focuses more attention on different functions of the administrator and the politician. According to Wilson, ". . .administration lies outside the proper sphere of *politics*. Administrative questions are not political questions. Although politics sets the tasks for administration, it should not be suffered to manipulate its offices. Following in its stead was *Frank Goodnow (1900)* who posited that the function of politics consists in the "expression of the will of the state" – (making value judgments, and with determining what government should or should not do), and administration the "execution of the state will" – (implementing what has been decided upon, that is, carrying into effect the decisions of the political branches). The task of policy-making then becomes the responsibilities of the politicians, while the bureaucrats handle the implementation of policies.

Holzer and Schwester (2011) rightly observe that in contrast to the notions of nineteenth-century reformers like Wilson and Goodnow, twentieth-century analysts acknowledged the reality that appointed administrative officials often take the lead in making policy, while lower-level public officials often interpret policies. ". . .in a pluralistic political system in which many diverse groups have a voice, public administrators with considerable knowledge play key roles. Legislation, for instance, is written by public administrators as much as by legislators. The public bureaucracy is as capable of engendering support for its interests as any other participant in the political process, and public administrators are as likely as any to be part of

a policymaking partnership" (Holzer and Schwester 2011, p. 177). The complexity of public policy-making which is so reflected in many actors and interests is indicative of conflicts and determination of "who gets what, when and how," in the policy process. The political nature of determining and arriving at a solution to address an identified policy problem which sometimes left inconclusive gives the latitude for bureaucracy to influence the direction of policy. The argument is that those who participate in the legislative process are unable or unwilling to arrive at precise settlements among conflicting interests on many issues. Only by leaving some matters nebulous and unsettled can agreement on legislation be reached. Lack of time, interest, information, and expertise as well as the need for flexibility in implementation may also help explain the delegation of broad authority to agencies (Anderson 2011, p. 217). The arena of resolving conflicts is eventually shifted to bureaucracy who deploys resources (information, expertise, knowledge among others) to ensure a balance amongst the contending forces.

Anderson's (2011) analysis of how agency can develop policy spotlights on the interplay and the relationship of bureaucracy and policy. Administrative agencies engage in a wide range of activities and make multitudes of decisions as they administer the laws within their jurisdiction. They can make policy when they apply existing laws or rules to particular situations by case-to-case decision-making. In so doing, they act in much the same manner as courts, just as they act in legislative fashion when engaged in rule-making. Agencies may also mold policy through their various law enforcement actions. A statute may be enforced vigorously or even rigidly, in a lax manner; or not all; it may be applied in some situations and not in others, or to some persons or companies and not to others. Many agencies administer loan, grant, benefit, insurance, and service policies and programs or engage in the management of public properties such as parks, forests, etc. how such programs are implemented helps determine policy both directly and indirectly (Anderson 2011, pp. 232–239). It is possible to think that the ability of bureaucracy to exercise power in the policy process is as a result of the rise of the administrative state with its increasing complexity. Policy-making role of the bureaucracy not only become apparent in policy implementation but also in the process of formulating policy.

## Conclusion

This discourse is centered on how bureaucracy interact with public policy, that is, how bureaucracy influences policy implementation and how policy in turn shapes implementation. The analysis submits that the implementation stage of the policy process is very important as it determines whether policies become tangible or concrete.

It is very clear that because administrative agencies are repositories of specialized skills and as such tend to influence policy decisions in many areas. Certain resources form the stimulus from which bureaucracy derives its influence for exerting influence on policy process.

Analysis has shown that bureaucracies as actors in the policy process reside in a rather difficult position within the middle of increasingly complex policy processes (Howlett and Wellstead 2011). On one hand, bureaucrats are working upward to their nominal political masters, providing policy advice and at times also thinly disguised political advice. On the other hand, they are also working downward, with implementation being a means through which they not only make policy have real effects in society but also make policy as they exercise delegated powers (Peters 2015). Investigating the role of bureaucracy in the policy process will continue and remain dynamic as long as the modern state continues to be the arena of policymaking and implementation.

## Synonyms

Good governance; Governance; Policy governance; Public policy

## Definition

Public policy is a long-standing decision made by governments or public authorities to address the public concerns or initiate ideas or solutions to public problems. Governance is the process of governing a city, an organization, or system where the decision-making process is involved by which the decisions are implemented or not implemented.

## Introduction

In the last few decades, public policy has become more crucial, and the governments keep trying to improve the existing public policy to suit current situation. For example, does the current public education policy give an impact to every level of society? Is the current development and welfare program good or poor or does not give an impact toward poverty eradication? Are the existing environmental initiatives sufficient or too much on environmental protection? These questions are always being discussed to address the public policy issues in every level of authority.

The society nowadays is more mobile because of the development in transportation and communication. In fact, the current society is more aggressive on the public issues and knowledgeable because they have good accessibility on the

information. Every ethnic groups and political parties are trying to arise the public issues so that can benefit to their group. Accordingly, most of the public policy is often fluctuating as reflected in the current situation. Hussin (2008) has discussed that every ethnics and groups has an endeavor to fight for their public right which results in movements that contravene the doctrine of cultural diversity.

The discussion above shows that public policy becomes very crucial nowadays in the context of scientific perspective and practical perspective. In-depth understanding on the causes and effects of public policy to society is very important for strategic improvement in the context of scientific perspective. In the context of practical perspective, participation of society in the process of public policy which is formulation and implementation is imperative. Therefore, the process of public policy needs cooperation and involvement of multiple stakeholders that require a good governance.

The concept of governance is not new and it was used since the Persian Empire which is more than 2000 years ago. However, the modern perspective on governance is becoming more complex because of rapid change in the role of government and the process of governance which accelerates the phenomena of globalization (Farazmand 2004). Hence, it is very crucial to explore and study the current characteristics, values, and utilities of governance concept in the context of public policy administration.

In the following pages, the approach of public policy implementation and good governance theory are discussed to comprehend the relationship between both concepts. A general overview of good governance practices and poor governance has also been reviewed below. At the last section, the explanation of good governance practice for effective public policy implementation is given with the situational analysis of solid waste management (SWM) policy.

## Public Policy Implementation: Top-Down and Bottom-Up Approach

According to Matland (1995), public policy implementation is assumed to occur at two levels which are at macro implementation where the centrally located actors devise a government program and micro implementation where local level actors react to these plans and develop their own plans and implement them.

The top-down approach assumed that implementation begins with public policy objectives and implementation will follow in a linear fashion as product of a rational public administration model and which assumes distinct public policy formulation and implementation. The top-down approach lays emphasis on the actors who design the public policy and the factors which can be manipulated from the top or federal government (Schofield 2001). However, top-down approach emphasizes on the rational design of the public policy which can give benefit to all.

The top-down models see the starting point of implementation as identifies the central actors as most influential in producing the desired effects of the decision (Orquin et al. 2013). The characteristics of top-down approach of public policy have a minimum number of actors involved and limit the extent of change in content and implementation done through agencies which is responsible for public policy goals. The weakness of top-down approach of public policy is it fails to consider the significance of past actions in the same policy area. Besides that, it treats implementation as an administrative process and ignores the expertise of local implementers but sees them as impediments to implementation.

Bottom-up models developed from the main criticism of top-down models which ignored the behavioral aspect of implementation and the key role of local implementers (Schofield 2001). It is focusing on the motives and actions of actors involved in public policy implementation. Moreover, it assumes that formulation and implementation are an integrated process (Matland 1995). The bottom-up approach is emphasizing the target groups and service deliverers (Cerna 2013). Bottom-up public policy models are more practical as compared to the top-down public policy models because it's considered public policy from the eye of target groups and service deliverers.

The criticism of the bottom-up public policy models is that it lays too much emphasis on the autonomy of local implementers, whereas public policy control needs to be done by actors whose power to formulate policies is derived by virtue of them being elected representatives. Further it is possible to influence the goals and strategies of the local actors by determining their institutional structure, resources made available to them, and their access to the actual implementation arena (Schofield 2001).

A combination of the top-down and bottom-up approaches occur when interest groups and stakeholders are build an unit of analysis like advocacy coalitions group who share the same set of beliefs and goals (Paudel 2009). To achieve a meaningful public policy formulation and implementation, it is appropriate that a specific public policy is used as the unit of analysis instead of a broad public policy area. Both top-down and bottom-up approaches can be used to prepare the implementation plan for public policy. However, it is dependent on the context and scope of public policy itself because the implementation plan developed should fit with the main objective of public policy.

## Good Governance Theory

The analysis revolves on the theory of good governance, and it will first and foremost be defined here to create a basic knowledge of the concept. The theories of development have been changing from dealing with economic growth to concerning poverty reduction and human welfare. This is because political and social aspects were not taken into consideration together with the economic aspects. In modernization theory, development is concerned about the process of transforming traditional societies into rich and modern societies. Therefore, the theories and approaches emphasized on democracy, equality, redistribution, gender, participation, and empowerment have emerged (Degnbol-Martinussen 2004).

The World Bank first introduced the term "good governance" in 1989 and throughout the 1990. After that, it is becoming a much-used term in the development aid agenda. In fact, this good governance concept has been promoted by many international agencies like the United Nations (UN), International Monetary Fund (IMF), United Nations Development Programme (UNDP), and most Western government. The poor governance was claimed to be the reason for the poor development, which opened for the promotion of political development and the good governance agenda.

In the last decades, good governance becomes one of the most pressing requirements for the underdeveloped and developing countries in Asia, Africa, and Latin America as a condition for international assistance and funding (Farazmand 2004). Therefore, the concept of good governance has been criticized by a number of leaders from underdeveloped and developing countries. They believe that the notion of good governance is an imperialistic and modern colonizing concept that shrinks the size of public administration and expands the private business sector through privatization. They also feel that this good governance concept paving the way of globalization capitalist corporation in searching high profit by dominating the business in developing and underdeveloped countries.

However, governance can be defined in various ways and secondly good is rather subjective. In fact, everyone wants good governance, but what is meant by the concept requires further elaboration. The implementation of good governance first and foremost depends on how governance is defined because it determines the area of operation. The understanding of governance changes from being a matter relating only to government to including something additional within politics, being public policies, institutions, a system of economic relationships, or nongovernmental bodies (Smith 2007).

Governance perceived as government focuses on the management of the public sector and the legal and administrative capacity, whereas governance including politics focuses on:

> The way power and authority are exercised; the management of a country's affairs; the relationships between rulers and ruled; how conflict is resolved; how interests are articulated and rights exercised; and so on. (Smith 2007)

The Danish International Development Agency (DANIDA) operates with the broad approach to governance in its strategy for good governance, thus including elements within politics. The main focus is placed on the public sector in ensuring good governance, but DANIDA recognizes the importance of civil society groups and other non-state actors in holding the public sector accountable and in advocating needs and priorities (DANIDA 2007). Hence, DANIDA has defined governance as government plus non-governmental bodies. The exact definition of good governance employed is the following:

> The transparent and accountable management of human, natural, economic and financial resources for the purpose of equitable and sustainable development, in the context of a political and institutional environment that upholds human rights, democratic principles and the rule of law. (DANIDA 2007)

Moreover, good governance theory is reflecting the interest of the social science community in a shifting pattern in styles of governing (Stoker 1998). Since 1980, the theory of governance has been used to describe the change in political process of Western society (Toikka 2011). In fact, governance was traditionally defined as government. Government is referring to the formal institutions of the states and their monopoly of legitimate coercive power. Government is characterized by its ability to make decision and its capacity to enforce them. In particular government is understood referring to the formal and institutional processes which operate at the level of the nation state to maintain public order and facilitate collective action (Stoker 1998).

The contemporary theories on governance make a fundamental distinction between governance and government. However, the concept of governance has covered more broad issues when compared with the government concept. The different concepts of both theories have grab the attention of plenty scholars to study the reason of the shift of governing styles. In fact, governments have the formal authority to act which have powers to enforce compliance with their activities, rules, and policies. Therefore, stakeholders do not have the accessibility to interfere with the policy developed. In contrast, the governance concept has emphasized the partnership with all stakeholders in order to empower them and give them equal access to development and decision processes. Hence, the power of decision-making and development is not limited to formal authorities and institutions.

What is meant by good is thus that governance is transparent, accountable, ensuring equity and sustainable development and respecting human rights, and democratic principles. This illustrates the complexity of good governance concept in policy implementation. However, the main objective of good governance is to enhance public policy administration in wide perspectives.

## Good Governance Practice

Good governance theory is frequently used to understand the good governance practices. Rose and Miller (1992) have highlighted that good governance practice is one of the techniques to deploy or translate the good governance theory. According to the United Nations Development Programme (UNDP), there are five main principles to practice good governance which includes legitimacy and voices, direction, performance, accountability, and fairness (Table 1). However, these good governance practices suggested by UNDP are a guideline to enhance the organization performance in the context of management and services. The good governance practices have been discussed broadly in improving the organization performance. Good governance practices are significant to explore to address the issue of poor governance in public policy implementation.

## Poor Governance

The contrast for good governance is poor or bad governance. According to Coker and George (2014), poor governance is inability of organization to manage the resources effectively and solve the conflict among staffs or stakeholders in decision-making. In the context of government, poor governance becomes more pronounced when a state or government fails to meet the

**Public Policy and Governance: Theory and Practice, Table 1** Good governance practices based on principles (Graham et al. 2003)

| Main principles | Good governance practices |
|---|---|
| Legitimacy and voices | **Participation**: All gender should have a voice in decision-making, either directly or through legitimate intermediate institutions that represent their intention. Such broad participation is built on freedom of association and speech, as well as capacities to participate constructively **Consensus oriented**: It mediates differing interests to reach a broad consensus on what is in the best interest of the group and, where possible, on policies and procedures |
| Direction | **Strategic vision**: Leaders and the public have a broad and long-term perspective on good governance and human development, along with a sense of what is needed for such development. There is also an understanding of the historical, cultural, and social complexities in which that perspective is grounded |
| Performance | **Responsiveness**: Institutions and processes try to serve all stakeholders **Effectiveness and efficiency**: Processes and institutions produce results that meet needs while making the best use of resources |
| Accountability | **Accountability**: Decision-makers in government, the private sector, and civil society organizations are accountable to the public, as well as to institutional stakeholders. This accountability differs depending on the organizations and whether the decision is internal or external **Transparency**: Built on the free flow of information. Processes, institutions, and information are directly accessible to those concerned with them, and enough information is provided to understand and monitor them |
| Fairness | **Equity**: All gender has opportunities **Rule of law**: Legal frameworks should be fair and enforced impartially, particularly the laws on human rights |

needs of the society even though it makes use of the best of all the resources at their disposal. Moreover, Owoye and Bissessar (2012) discussed poor governance as a contagious symptom of institutional and leadership failures. In summary, poor governance can be described as a flaw of organization to manage its resources in solving conflict and make a good decision. In fact, poor governance is something opposite to the practices of good governance.

Previous studies have discussed the main factor of poor governance is unaccountability (George 2013). Specifically, unaccountability indicates no strategic plan or no evidence that existing strategic plan has any impact to the organization. This example shows objectives and goals of organization are vague which would lead toward failure. Moreover, unaccountability also describes no evidence of proper monitoring in financial control and no planning to provide financial sustainability and reputational gain. This example exhibits unstable financial which would disturb operation work of organization.

Besides that, previous studies also highlighted that lack of openness and transparency is also one of the causes of poor governance (Adesola 2012). Lack of openness and transparency shows no annual report on organization performance. Besides that, all the information and decisions made by the governing body are not available to the staffs and relevant stakeholders. So, it is difficult for the staffs and stakeholders to access the information. In fact, decision made by the governing body should be disseminated effectively to the staffs and stakeholders who are responsible in operation work, so that what has been decided by the governing body is understandable by the staffs and stakeholder.

## Good Governance Practice for Effective Public Policy Implementation: A Situational Analysis of Solid Waste Management Policy

Public policy is a tool used to control the activities of civilian to attain its ultimate goal which is public good. In the context of solid waste management, the policy was developed to reduce the impact of unsustainable waste management to human as well as to environment. In fact, to achieve effective solid waste management, policy implementation is not an easy task, but it is not

impossible to be attained. In the context of developing countries, politics inevitably play a large role in solid waste management systems. The structure, functioning, and governance of solid waste management systems are affected by the relationship between central and local governments. The role of citizens in policy-making processes and policy implementation is less concerned. The effective policy implementation should involve the citizens. Hence, it is crucial to strike the right balance within the institutional and citizen perspective for effective solid waste management policy implementation.

Good governance practice is requiring the participation and collaboration of all relevant parties, including government, nongovernmental organizations (NGOs), community groups, and the private sector. Good governance allows low-income groups to influence policy and resource allocation, and therefore it is essential for equitable, effective, and efficient solid waste management policy implementation. Indeed, the efficiency, along with the effectiveness of SWM is one of the requirements in assessing good governance index. Low-income countries tend to lack appropriate governance institutions and structures typically found in high-income countries, such as public policy research institutions, freedom of information laws, judicial autonomy, auditor general, and police academies (Bhuiyan 2010). This lack of democratic structures and competent, representative local government creates barriers to proper solid waste management policy implementation.

Moreover, effective solid waste management policy implementation requires firmly established institutions to avoid controversies, ineffectiveness, and inaction, making solid waste management systems politically unstable. Even when regulatory and legislative frameworks exist, governments with weak institutional structures are easily overwhelmed by increasing demands for solid waste management as urban populations explode.

Institutional aspects also include the current and future legislation and the extent to which it is enforced. A straightforward, transparent, unambiguous legal and regulatory framework, including functioning inspection and enforcement procedures at the national, provincial, and local levels, is essential to the proper functioning of a solid waste management policy. According to Wilson (2007), there seems to be general consensus that weak institutions are a major issue in emerging and developing countries such as in Asia, Africa, Latin America, and Russia. Institutional strengthening and capacity building are one of the major drivers in good governance practices. Hence, good governance practice in public policy implementation is very significant in developing countries.

## Conclusion

The process of public policy which consists of policy formulation and implementation significantly requires good governance practice intervention. This level of governance action entails the guiding formulation with decision-making on public tasks. Besides that, public policy implementation refers to that part of governance that involves activities in relation to public tasks implied by the directional decisions of those tasks. However, the practice of governance in public policy implementation is depending upon policy delivery activity at stake. Given the multiple characters of the contexts in which practitioner of public administration is acting, we have acknowledged that the application of the governance practice will vary from situation to situation. Therefore, the study of public policy and governance is very significant nowadays. In fact, we need to appreciate the opportunities that are available in public policy process because there are a lot of opportunities for improvement.

# Public Policy and Instrumentalism

Christopher L. Atkinson
Department of Administration & Law, University of West Florida, Pensacola, FL, USA

## Synonyms

Instrumental reasoning; Instrumental-technical rationality; Pragmatism

## Definition

Instrumentalism in public policy invokes a means-ends course of action, often based in administrative process and technique, which deliberately defines public problems and their solutions with a mind toward achieving a favored societal goal (Rochefort and Cobb 1994). This emphasizes "the connection of (scientific) rationality to the conduct of life itself. . .the methodological attainment of a definitely given and practical end by the use of increasingly precise calculation of. . .means" (Adorno, quoted in Held 1980, p. 65).

## Introduction

This work explores public policy and instrumentalism, with a focus on implications for public administration. First, the notion of instrumentalism in the public policy context is discussed. Next, instrumental reasoning is reviewed as a basis for language games, and obscuring of the purpose and intent of policy; ramifications for public service and its obligations are contemplated. Finally, a brief consideration of work on instrumentalism in public policy is offered in conclusion.

## Public Policy and Instrumentalism

Instrumentalism may be thought of in its initial conception, following John Dewey's branch of

pragmatism, as the valuing of ideas based upon their usefulness; there is no absolute way to know for certain that an idea is best, so rightness or fit with a vision of reality is less important. From this original model, instrumentalism has grown to include applications in a variety of fields, including public policy. In policy circles, a belief in policy instruments and techniques as useful or ideal in addressing public problems is a hallmark of instrumentalism and technical rationality. In this thinking, policies will be more useful when they are implemented fully; the difference between truth in a grand sense and rightness or usefulness of a theory in a particular instance is, in an instrumentalist view, negligible. What matters more is the connection of scientific and technical knowledge to problem-solving, and the imposition of a solution based upon interaction and coping with a problem; this requires the involvement of policy agent with environment. Policy in the instrumentalist tradition is a demonstration of collective intelligence brought to bear on public problems (Quirk 2000). Instrumental reasoning is one of three modes of reasoning outlined by Habermas, along with practical and critical reasoning (Farazmand 2002).

Inherent in the idea of instrumentalism is that public policy aims are realized through laws and programs (van der Meulen 2013). Instrumentalism places the value of government in its ability to intervene: "Governments (or their advisers) are said to recognize problems, identify ways of responding to them, evaluate consequences of these options, and arrive at decisions – a technology of government as episodic instrumentalism" (Colebatch 2014). This approach favors a means-ends orientation; from a citizen's perspective, the governmental apparatus might appear cold and distant, processing citizens like objects to be optimized, limiting the legitimacy of the enterprise that comes from collaboration and direct interaction with the public (Kelly 2004). From a legal perspective, instrumentalism speaks to the value a particular rule has in a given case (Van Detta 2004); programs should be understood from the perspective of what they were intended to accomplish. A good law, procedure, or program accomplishes desired ends, and governmental tools that result in lackluster outcomes fall short of the ideal, even though this calculation might ultimately betray the complexity of government, its actors, and processes.

This has serious implications for public administration, which has been at a crossroads of serving as an agent for the goals and whims of a principal, or providing the venue for collaboration with and service to the public itself. Instrumental approaches tend toward "the automatizing of society and human behavior" (Horkheimer 1974, pp. ix–x), producing "a degree of organization and manipulation that leaves the individual only enough spontaneity to launch himself onto the path prescribed for him" (1974, p. 4). The rational answer is proffered in reaction to the irrationality of the present day, as if a top-down constraint of reason would be an acceptable response; citizens become customers, and ask fewer penetrating questions, because doing so would be futile (Horkheimer 1974). The past and context are progressively purged from consideration; while people have created a machine of programs and prospects for client communities, instrumental reasoning forces administrators to resemble the machine they have built. "Instrumental reasoning leads to social domination and control because of its inflexible use of technique," and such reasoning legitimizes bureaucracy and capitalism, depending in some part on the lack of engagement of the public (Farazmand 2002, p. 45).

Public administration has been traditionally and historically defined by its tendencies toward instrumental-technical rationality. In the Weberian sense, organizational actions may be directed toward an ideal of efficiency. Differentiation of roles and specialization of knowledge and skill are prime components of this deliberation. However, in the need for larger organizations, especially, to manage their functional responsibilities and spans of control, the potential exists for administration to embrace too much the tools of the profession, as supposedly rational and leading to optimal outcomes, when organizations themselves are inefficient and far from rational (Jun 2006). Instead of looking to the public and adapting to the changing nature of program, population served, and operating context, inclination may exist to simply

engage in the activities of the program, believing it will solve the problem, even in changing, complex circumstances. This reduces the potential for communicative rationality, which might allow individuals autonomy and means of freely and openly reaffirming their place in community (Morris 2009).

The role of technician is revered in public administration; it is a strongly instrumental position that depends on at least a perception of objectivity and expertise, and that answers resulting from policy processes were, in view of authors like Comte, like other phenomena and subject to common natural laws. Public administrators, working on the boundary between the political sphere and the public, play a role in implementing policy that imposes a science-based approach to public programs, mostly without engaging in the creation of scientific understanding. The activity of administrators, then, utilizes scientific approaches as a rationale for action and intervention (Stehr and Ruser 2017). There is a strong strain of instrumentalism in American society, in particular, and critique of instrumental approaches has as a result not been warmly welcomed, even if the critique remains valid (Schlembach 2015). From the 1950s, improving the instrumental rationality of applied policy became a greater focus. Even with a rising critique in the 1980s, movements like New Public Management (NPM) in the 1990s returned the focus to improving outcomes from policy absent larger discussions of context or the intractability of some policy issues. Even today, governments regularly refer to a need to have fuller knowledge of policy matters before making decisions, even in situations where administration cannot keep up with the information already flowing through it; practical understanding is eschewed in favor of an unattainable gold standard of pure, objective knowledge (Parsons 2004).

## Public Policy, Language Games, and Obligation

Public policy language is heavily informed by language that is at least initially, and perhaps primarily, normative. This language is saturated in belief; public programs that are born of this environment presume their worth on a host of bases, not purely whether the program results in the outcomes intended initially. The profession of public administration is confronted with a potentially critical impasse – the difference between actually accomplishing goals of client service, potentially separate from an enacted and politically preferred public policy program, and maintenance of programs, institutional structures, and relationships that may not serve client needs but serve the cause of stability, not to mention long careers. A key factor of legitimation is encouraging belief in the population that programs serve their supposed ends. This drive can result in the playing of language games. Programs may make reference to served groups and services provided but fail to achieve useful outcomes outside the domain of the immediate, within the administrative. Where the public might look to government for proof of concepts, and of the value of programs, if not truth, what might be offered instead is soothing language, hopefulness, and the possibilities of future success. How citizens perceive their existence is bound up in the policy language, definitions of clients, eligibility for programs, and processes of the administrative state. This language is not only work product for the administrative state; it also creates meaning for the public (Wellmer 1974).

A larger problem for the legitimacy of public administration is that attention to maintenance of existing systems and instrumental tools, for stability or otherwise, may breed inattention to the active service of public needs. A policy or program seeks to be a mirror for the experience of a public, its challenges, and a way forward to improve prospects, but is ultimately ineffective because it is limited in scope and detail. The existence of a shorthand or sketch of a program and how it assists through implementation lends a level of appropriateness to avoidance of obligation and the difficult work of public engagement and service. Instead of inquiring about the problem as experienced by a client, the institution shifts attention to the policy instrument and its care and maintenance. This shift stands in for

effectiveness, through an increased emphasis on program characteristics and qualities, instead of performance in serving affected communities.

The prospect of clear and useful public administration, and the validity of efforts taken in consideration of public needs, rests in outcomes. However, instrumental reasoning narrows the focus of problem definition to a restricted field of variables, and thus the definition may fail to account for complexity and context, as well as the lived experience of client communities. Further, instrumentality is predisposed to routinization – this suggests to administrators that there is little need to consider other potential solutions and alternative definitions of problems and competing interpretations of what needs to be addressed through policy (Capano and Lippi 2017).

As Peters observed, New Public Management (NPM) was rooted in the thought that "if programs were better delivered then the problems would indeed be solved. That was never the case" (2011, p. 6). The policy tools themselves delivered as programs are no more neutral than the choices made in defining the problems they are ostensibly enacted to solve (Peters 2011). How problems are aligned and how programs are constructed and function may not actually align at all to accomplish any change in reality for the target population of a public policy program. Too much emphasis on the program as an instrument, and the belief in the ability of the instrument itself to solve the problem as defined, leads often to underwhelming outcomes, if not serious concerns for client communities, in that the problem as it actually exists may not be addressed at all well by the program as enacted.

## Importance of Critique of Instrumentalism

Instrumental rationality supports the importance of rules, procedures, and programs; a strong instrumental belief indicates a core tenet that problems can be defined and resolved effectively with the imposition of policies and programs. On the face of it, instrumental thought makes sense. Questions like whether the private sector should provide prison services might depend purely on which sector provides the best services (Brennan 2017). However, one might suggest that "best services" is indicative of different things to different people, and so is contested territory. The imposition of one regime or the other, absent public involvement, is a reliance on instrumental thought and technical expertise over the potential valid contributions of local/community knowledge and expressions of public wants and needs.

A critique of instrumental reasoning was closely associated with the Frankfurt School beginning in the 1930s. It was suggested that science, evidencing itself through policy tools and programs in administrative action, had extended beyond its instrumental role and had begun to undermine and interfere with the proper function of the social sphere – discussions about norms gave way increasingly to overreliance on supposedly pure reason in technical responses. (O'Neill and Uebel 2004).

The presence of a program can lead to a belief that the public has control over the choices that it makes, even if the array of choices is severely limited, favoring certain preferred problem definitions and methods of resolution. Choosing from among a series of options, even if the options are limited, can still lead to a sense of empowerment and even freedom; it is a misperception and fantasy, but it is comfortable and leads to outcomes desired by those enacting the programs. The problem with this sort of policy-led comfort is that real decision-making skill and capacity to adapt may atrophy in non-use. The sense of self can become thin (Fotaki 2010); this problem is not exacerbated by the imposition of thin policy as much as created by it.

## Conclusion

Within a wider discussion of the proper and most worthwhile roles for government, the rationality of the pursuits and ends of government intervention has been a consistent touchstone. The perspective that administration acts best if it remains within narrowly drawn characterizations of implementation, working to achieve ever-greater levels

of efficiency, has been countered in the literature with a critique of instrumental rationality and belief in the place of policy tools to resolve complex societal obstacles. This is also a debate between the place of technical skill and expertise in an instrumental orientation and the right place of morality in public service; achievement may be had with imposition of policies and programs, without as much thought to context and lived experience of the public served. Instrumental reasoning in government depends on an acceptance that preferred ways of responding to problems are right, or at least more right, and that programs, created by wise people, will resolve society's most pressing dilemmas; if the public believes that it is still the source of rule, then so much the better (Korstanje 2011). This reduces the public's ability to involve itself in and to influence the public sphere – to play a meaningful role in the lifeworld (as posed by Habermas), in opposition to the system of programs and policy tools (Kiisel 2013). This could be portrayed as a noble lie, but it is a lie, regardless, and it reduces the humanity of all concerned.

An over-reliance on instrumental reasoning is treacherous. Even when some element of the human spirit may overcome the web of processes and definitions of the administrative state, acting as a stabilizing and constraining factor for both individuals and society as a whole, the majority of the public will often choose the stability of the state, with its techniques and instrumental solutions, and the idea of a government with all the answers to problems caused by people. This is a false security and portends a hollowing out of the lived experience of humanity – eventually lowering the ability of humankind to solve its problems. The need then is for a return to engagement, to tolerant discussions amongst people of diverse opinion and engagement in public debate and even disagreement – even when techniques and instruments of administration seem to provide an easy way out.

## Synonyms

Collective interests; Dominant parties; Hegemonic parties; Legislative parties; Majority-preferred policy; Party government; Party policy; Political polarization; Political representation

## Definition

Public policy: A set of interrelated decisions adopted and implemented by the state and other political and non-governmental actors concerning the long-term goal setting and means of achieving them in particular environment and circumstances.

Political party: An organization which is created by individuals who share common political ideas, which takes part in elections and able to hold its representatives at key positions in executive and legislative branches.

## Introduction

Among the great variety of public policy actors, political parties play a central role in the decision-making process. They mediate and integrate the goals and desires of citizens with public policy agenda and nominate candidates for key public offices, thus securing a unique position for themselves: on the one hand, they are agents of civic society and systematically represent social groups in government, and, on the other hand, they are an integral part of executive and legislative institutions responsible for public policy. Political parties' ability to influence public policy is defined by such institutional constraints as types of executive-legislative branches relations, party system, and type of political regime. Such constraints are interrelated in various combinations and determine the status and place of political parties in a particular political system.

## The Consequences of Institutional Differences for Political Parties

The institutional structure of a modern state is based on the principle of separation of powers. The pattern of interaction between executive and legislative branches is critical for public policy. In a parliamentary system executive and legislative branches are linked through the party holding most seats. In the UK, for example, a parliamentary system is based on a single majority party. On the one hand, it ensures hierarchical accountability of the cabinet to the parliament; on the other hand, it guarantees seamless passage of governmental initiatives and bills through the parliament requiring no approvals. The governing political party holds central place in the political system and implements public policy using its representatives in executive and legislative authorities. The ability of the opposition party to influence decision-making by initiating legislation is reduced to a minimum, but it acts as a restraint through participating in debates, registering the governing party's faults, and encouraging public support of their initiatives using mass media and political actions.

In the absence of a majority party in the parliamentary system, the executive branch relies on a coalition resulting from numerous transactions, agreements, and exchanges between political parties. When implementing public policy, the executive arm tends to depend more on political parties since both the head of the government and the priorities for political development are determined by a coalition of parties that can change significantly over one parliamentary term. Coalition governments exist in all European parliamentary systems.

In the presidential system, executive and legislative branches are independent of one another. They can be both controlled by the same political party, but sometimes the executive branch is occupied be one party and the legislative – by another, opposed party, thus strengthing the political position of a party holding the majority of parliamentary seats. It can successfully negotiate with the party in control of the executive power to include own priorities and goals in the public policy agenda. The USA makes a classic example where such set up occurs quite often forcing the president to pursue a more moderate public policy. However, if both the executive and the legislature are in the hands of one party, it strengthens the position of the head of the state and makes it possible to implement public policy aligned with one party priorities.

The type of the *party system* determines the ability of existing parties to influence the decision-making process. In competitive party systems, several strong political parties routinely alternate in power with none of them monopolizing it. It creates favorable conditions for the development and implementation of a consensus-based public policy, integration of various parties' priorities in a single political course, enhancing the legitimacy of power.

In noncompetitive party systems, representatives of one major party may retain power in the executive and legislative arms for an extended period of time. Other parties stay on the periphery and cannot produce a strong competitor to such a hegemon. Thus, public policy, totally dependent on political goals of one party, is not challenged by other political forces and suggests tough methods of implementation, frequently relying on force.

## The Status and Role of Political Parties in Post-authoritarian Systems: Case of Russia

In political systems that have attempted democratic modernization, the status and role of political parties in public policy are different from the western political parties. They do not perform their key function of representing collective interests in power. The main reason for this is the different logic of party formation. In the European countries, political parties have been becoming democratic institute gradually. This process was supported by the demand for institutions of representation of political interests from active civic society, by the extension of universal suffrage, and by establishing other democratic institutes.

In many post-authoritarian countries, with Russia not being exception, democratization process was impetuous new democratic institutes that were established in just 1 day. In economic and political reforms, social changes were complicated and have been proceeding simultaneously. So, is was the demand deficit for institutions of political representation in Russian society in the 1990s; the main goal of Russian citizens was to adjust to the new difficult social and economic realities.

But still myriad political parties have been established in the first 10 post-soviet years. Only some of them had a goal to get seats in State Duma and influence public policy, most of them have been represented political interests of single ambiguous public figures who were aimed at getting a seat and exploit it. It is not surprising that such political associations were unstable and changeable; they could not become organizational bases for public figures to penetrate in legislative authorities. On the contrary, public figures, between whom doors of public policy had opened, were becoming a springboard for their parties to enter political power. The primacy of the leader in the party, secondary nature of its

ideology and organizational structure, allows the first Russian parties to be characterized as autocratic parties virtually excluded from public policy-making process as key participants. Until today only two such parties are continuing their political career: "Liberal Democratic Party of Russia" by Vladimir Zhirinovsky and "Yabloko" by Grigory Yavlinsky. The first one constantly wins seats in State Duma; the second one has changed its leader, but lost seats in the parliament, and was largely marginalized.

Not only sociological factors prevented the convergence of parties and social groups' interests and limited their role in policy-making process in Russia. After new post-soviet institutional design was established and secured in the Constitution and main laws, participation of the head of state and all government members in the party system has been limited. Such an approach is unusual for the western public policy, but it was needed that period in order to prevent communist revenge and strengthen political positions of new democratic ruling elite. Access of political parties to the policy-making process threatened mobilization of communist electoral support. In comparison with all new parties, Communist Party of Russian Federation is still popular among more than 20% of Russian citizens.

Thus, access to executive power for parties was closed, establishing their peripheral position in public policy-making. Being excluded from the executive branch, political parties did not receive influential positions in legislative branch too, because ruling elite did not need their support to develop and implement public policy. In such institutional design, the executive is not a continuation of majority party or coalition of parties (like in parliamentary system) and is not the partner or competitor (like in presidential system) but is totally autonomous and has also ways to control parties' political position. In fact Russian ruling executive elite needs parties as an essential element of democratic façade and not as an important actor of public policy.

As a result when people have no demand for representation institutions, and these institutions are removed from the policy-making process, they stop being communication channels between society and power, but they are still required to legitimize democratic character of policy-making.

## Changing Role of Political Parties in Public Policy in Modern Russia

Outsized Russian party system of the 1990s was gradually transformed due to the activity of ruling elite. Among the feathers of party system, there is one more very important element – the political parties governing law. This law regulates conditions of political parties' formation and gives ruling elite an opportunity to manipulate with them to get desirable party space configuration. So due to the changes in the law which restricted requirements (such as the minimum number of party members, regional offices, etc.), the number of political parties decreased dramatically. These modifications have not changed radically the role of parties in public policy, but have weakened political opposition in Russia, and limited the opportunity for new political parties to influence political process.

Due to this law ruling elite began to use political parties to promote and legitimize its policy in the public domain and create parties to secure its monopoly. This desire contributed to the monopolization of party space, and an emerging characteristic trend is the materialization of a "party of power" that does not make public policy but implements the public policy of the ruling elite, totally depends on the governmental resource support, and, yet, is positioned as the voice of collective interests.

However, it does not mean that party system has changed greatly. In fact, the nature of Russian political parties has stayed the same – they are continuing to be autocratic and constrained by the political will of the leader. In case of "party of power," they are not free from the political will of the head of the state. Gradually the country has acquired a political system with a strong power center represented by the head of state who needs the mobilization of popular support to strengthen his political position and a credible parliamentary partisan support to legitimize his current public policy. This structure requires complete

independence of the executive from the political party in implementing public policy and total dependence of the party from its "patron's" status as its condition. It makes it possible to transform the party, replace it with another one, materially change its composition, and adjust its goals and priorities without any consequences. People however will not notice these changes because there is no association with the party in their mind or political practice but rather an association with the figure of the political leader.

During the period of Boris Yeltsin's presidency, there were several attempts to establish the "party of power" around the figure of prime ministers. The most successful one was the party "Nash Dom Rossia" ("Our House is Russia") by Victor Chernomyrdin (1995–1999). Since 2003 until present time, party "Edinaya Rossia" ("Uniformed Russia") is holding a standalone majority of seats in State Duma. In the current parliament, the party controls constitutional majority of seats (343 seats out of 450). The official party leader is Dmitry Medvedev who in this case is a member of the party, but at the same time, the party officially supports the political course of the head of the state, Vladimir Putin, who is not a member of this party. What is more unusual is that party is controlled by the head of the state, but not by its official leader. He could manipulate the party, but the party could not do the same, and it follows leaders' policy and must guarantee its legitimacy and implementation through the legislative activity. Public funds, administrative support at all governance levels, and political leader's charisma ensure party's electoral success.

Speaking about the "party of power" and its role in public policy, it is necessary to underline that it differs a lot from regular parties. Besides the fact that it is established by the ruling elite to guarantee its monopoly in political space and as a result has little links with the society, the party is totally defendant on the career of political leader. Party's authority increases with the rising president's authority, but when the leader resigns or his/her popularity decreases, the "party of power" threatens to decay. In other words the "party of power" could not be in opposition, because its mission is to provide not its own political course but the course of ruling elite; it does not have its own resources to compete with other political parties, and it has not got its own political agenda to present to the public.

In such a system, other political parties may continue and act as very moderate opposition having no ambition to occupy positions of power. They are needed to create the appearance of a competitive political space but have no influence on public policy whatsoever. Rigid legal constraints create insurmountable barriers to forming independent political parties "from below" – by the initiative of public groups which is reinforced by people's negative perception of this political institution.

Another important aspect is that opposition parties in Russia are not as consolidated as the dominant party is. The opposition party space is highly fragmentized; party leaders are very ambitious and do not tend to merge in one strong political actor which could resist the dominance of "Edinaya Rossia." Besides, the activities of opposition parties are not visible for citizens; they know a little about their candidates due to the monopolization of informational channels and high level of political apathy. Without state support or big business funds to support them, opposition parties are being marginalized and lacking ability to influence public policy.

Of course, it must be said that in Russia there are political parties which are not truly in opposition but play the role of opposition parties. They officially compete with the dominant party in election campaigns and in political debates on specific topics. Owning to this, multiparty system does exits, but their criticism of the ruling party is very limited. Party leaders could criticize the dominant party activity, but they support and follow the head of the state policy. As a result opposing parties in the State Duma vote in the same accord as the president's party does. Such voting practice devaluates parliament opposition parties and exclude them from policy-making process.

## Conclusion

Modern political science views the relationship between public policy and political parties through the concept of interaction between

institutions and actors. The complex nature of political parties determines their role as the integrating element of the political system. Modern political practice displays various configurations of relationships between political parties and public policy, yet in all cases political parties are an essential structural element.

In case of Russia, the role of political parties in public policy are influenced by the logic of post-soviet modernization process and is continuing to be limited. The main trend in political party evolution is an attraction to the system with hegemonic party and weak opposition. This trend is strengthened by political apathy of Russian citizens and lacking in political motivation, typical for democracies.

|---|---|
| Public Policies | Public policies are decisions of government. They come as a result of the activities of government directed at achieving certain objectives. |
| Politics | refers to how decisions are allocated authoritatively in the society. |
| Policy cycle | refers to a framework which suggests that the policymaking process develops through stages of activities involving decision-makers, and through which a policy proposal is developed and implemented. |

## Introduction

Governments across the globe want to achieve specified objectives in education, health, agriculture, transportation, housing, environment, and other sectors of the economy to affect people's lives positively. Citizens of a particular country may desire many things and government being the representative of the people is obliged to do those things through the instrumentalities of public policies. Inherent in the concept of public policy is the notion and belief that it should serve the public good by having a utilitarian value for the greatest number of citizens. "In the course of their daily lives people are affected directly and indirectly, obviously and subtly, by an extensive arrays of public policies" (Anderson 2003, p 7). Whatever the level of government, proponents of policy actions seek a multitude of goals that also affect all members of society (Kraft and Furlong 2015). This article examines the relationship between public policy and politics. It discusses how public policies emerge and spots the place of politics in the policy process, that is, it focuses on how politics interface with the process of policymaking.

## Public Policy and Politics

As much as there is a consensus that public policy does not have a single definition, then a good starting point will be to consider some of the many conceptualization by policy scholars.

Hogwood and Gunn (1984, pp 13–19) identify different ways in which policy can be understood: as a label for a field of activity (e.g., education/health/housing/economic policy); an expression of intent (e.g., "we will improve healthcare"); specific proposals (e.g., a manifesto or white paper); decisions of government and the formal authorization of decisions (e.g., legislation); a program or package of legislation, staffing, and funding; intermediate and ultimate outputs (e.g., more doctors, better medical care); outcome or what is actually achieved (better health); and a process, not an event, or a series of decisions, not a single decision. Flowing from their descriptions is an indication that policy could mean many things to many people if not properly conceptualized. To Jenkins (1978), public policy is a set of interrelated decisions taken by a political actor or group of actors concerning the selection of goals and the means of achieving them within a specified situation where those decisions should in principle, be within the power of those actors to achieve. In their observation, Howlett et al. (2009, p 6) consider this definition to be helpful in specifying the *content* of a policy as being composed of the "selection of goals and means," presenting policymaking as a *dynamic process* and explicitly acknowledges that public policy is usually the result of "a set of interrelated decisions" that cumulatively contribute to an outcome. In other words, policy is not a single decision, but consists of several decisions on one policy issue. Using Howlett, Ramesh and Perl's example of health policy for illustration, a health policy will consist of a series of decisions on building health facilities, certifying personnel and treatment, and financing health-care provision among other related items. These various interrelated decisions are often made by different individuals and agencies within government. Further in their analysis is the observation that a government's *capacity* to implement its decision is also a significant component of public policy and a major consideration affecting the types of action that government will consider. The analysis also recognizes that the limitations on a government's ability to act can constrain the range of options considered, in particular, decision-making circumstances or can contribute to the success or lack of success of policymaking efforts. Public policy is therefore concerned with how problems and issues are identified, defined, and constructed; how they are placed on political and policy agenda; how policy options emerge; how and why government act or do not act and the effects or consequences of government policy on various stakeholders or actors.

Parsons (1995, p 2) notes that the idea of public policy presupposes that there is a sphere or domain of life which is not private or purely individual, but held in common. The public comprises that dimension of human activity which is regarded as requiring governmental or social regulation or intervention, or at least common action. The public element in public policy connotes the centrality of the role of government in policymaking. Thus public policies are governmental policies which comprise government legislations or laws, regulations, court decisions, and local ordinances that emerge through a process of enactment. It involves actors and interests in any policy area or a matter of concern. This is an indication that there are multiple actors and interests in the policy process. These policy actors as analyzed by Pinteric (2014) can be divided into two main categories: governmental and non-governmental. Among governmental policy actors, there are institutions of political representation (parliaments), institutions of executive branch (government, ministries, public agencies, etc.), public administration at different levels, and political representation on subnational level. Non-governmental actors are representatives of different interests (business and civil society groups), political parties/nonparliamentary parts of them), expert public (which usually plays role of competent knowledge that supports certain interests or suggests solutions), and mass media. Individual is also seen as policy actor, since there are individuals who are able, due to their social capital and other resources, to get involved into policy arenas as independent actors. Often they play role of moral and expert authority, which has certain level of influence over other actors or public (Pinteric 2014, p 41). Multiple actors and their interests are likely to conflict especially in a

situation where resources are scarce and barely enough to take care of all interests. There is emphasis on the need for knowledge and understanding of how these actors' interests, values, beliefs, and ideas can inform strategies to build support for and or reduce opposition to a policy proposal. So policies represent which of many different values are given the highest priority in any given decision (Kraft and Furlong 2015). This in part forms the reason why Harold Laswell's (1958) definition of politics as "*who gets what, when and how*" becomes apposite for analyzing the nature of policymaking. All the more, if policymaking is perceived as stages of controversy, enactment, and implementation, then a process of negotiation, bargaining, compromise, and consensus building among varying actors are all parts of determining how government policies come into effect. Imbue with all these features, policymaking can be said to be political. Lindblom's (1968, p 4) perception of "policy making as an extremely complex analytical and political process to which there is no beginning or end, and the boundaries of which are most uncertain" lends credence to this assertion. The policymaking process provides a contextual lens with which one can view how public policy emerges, and its interplay with politics.

## The Policy Process as a Political Process

Policy process (also known as Policy cycle) is a framework that breaks down the policy process into stages. The policy process model posits a logical sequence of activities affecting the development of public policies. It is a set of interrelated stages through which policy issues and deliberations flow in a more or less sequential fashion from "inputs" (problems) to "outputs" (policies) (Howlett et al. 2009). It depicts the policymaking process and the broad relationships among policy actors within each stage of it (Kraft and Furlong 2015, p 84). The concept of policy process brings the idea that public policies are shaped at all stages by different types of actors and institutions, actors can establish relationships (whether formalized networks or not) according to their beliefs/interests in the defense of an idea, their actions being affected by the context in which they operate and influenced by external events (Almeida and Gomes 2018). Although there are many frameworks and models serving as analytical tools for examining how policies are enacted, Parsons (1995) emphasizes the importance of the stages model of being able to reduce the complexity of public policymaking to a manageable form.

The idea of stages model was first put forward by Lasswell – "*The Decision Process*" – in 1956. He identified seven categories which are intelligence, recommendation, prescription, invocation, application, appraisal, and termination. Based on the growth of the field of policy studies during the 1960s and 1970s, the stages model served the basic need to organize and systemize a growing body of literature and research thereafter. The seven categories of the decision process soon became one of the more commonly referenced descriptions of the policy process. Subsequently, different stages and typologies have been put forward, usually offering further differentiations of (sub) stages (Jann and Wegrich 2007). Prominent among these models are:

Dye's, *Understanding Public Policy,* (1972): identifying problems, formulating policy proposals, legitimating policies, implementing policies, and evaluating policies

Rose's, *Comparing Public Policy,* (1973): public recognition of the need for policy to exist, how issues are placed on the agenda of public controversy, how demands are advance, the form of government involved in policymaking, resources and constraints, policy decisions, what determines governmental choice, choice in its context, implementation, outputs, policy evaluation, and feedback

Anderson's *Public Policy-Making,* (1974): problem identification and agenda formation, formulation, adoption, implementation, and evaluation

Jenkins's, *Policy Analysis: A Political and Organisational Perspective,* (1978): initiation, information, consideration, decision, implementation, evaluation, and termination

May and Wildavsky's *The Policy Cycle,* (1978): agenda setting, issue analysis, implementation, evaluation, and termination

Jones's, *An Introduction to the Study of Public Policy,* (1970): perception, definition, aggregation/organization, representation, formulation, legitimation, application/ administration, reaction, evaluation/appraisal, and resolution or termination

Brewer and deLeon's, *The Foundation of Policy Analysis,* (1983): initiation, estimation, selection, implementation, evaluation, and termination

Hogwood and Gunn's, *Policy Analysis for the Real World,* (1984): deciding to decide (issue search or agenda setting), deciding how to decide (issue filtration), issue definition, forecasting, setting objectives and priorities, options analysis, policy implementation, monitoring and control, evaluation and review, policy maintenance, succession, and termination

The variations and different terminologies notwithstanding, the models describe the identification of policy makers' objectives/aims, the formulation of policies to achieve the identified aims, the legitimation of policy proposals, and implementation and evaluation of such policy. It is a broad conceptualization of public policy. In other words, it helps in understanding where an issue emanated from, how policy proposal was formulated, how the policy was implemented, and the implemented policy subject to evaluation. In spite of the criticisms levied against the stages model one of which is its simplistic nature and its inability to prescribe outcomes, it still offers a useful advantage of simplifying the policy process for easy comprehension even for a nonspecialist in policy area. The simple but sequential nature of the stages helps to capture and comprehend the flow of action in the policy process (Anderson 2011). To Howlett et al. (2009, p 3), the policy cycle allows the highlighting of the operative factors and forces at each distinct stage of the cycle, from *agenda-setting, formulation, decision-making, and implementation to evaluation* and then back through the same process once again in successive iterations of the cycle in an effort to improve upon policy outcomes. Kraft and Furlong (2009, p 84) stress the cyclical and continuous nature of the process, rather than a onetime set of actions. "Instead of a top-down listing of each stage, it could be presented as a series of stages linked in a circle, because no policy decision or solution is ever final. Changing conditions, new information, formal evaluations, and shifting opinions often stimulate reconsideration and revision of established policies." The model can also be helpful to understand the flow of events and decisions in different cultures and institutional settings.

Each policy cycle begins with the identification of a problem and its placement on the policy agenda. According to Easton (1965), problems are demands that feed into the political system or structure of decision-making which are processed to become policy output. Policies, therefore, are responses to problems in the society. Defining a problem and determining its causes are not always simple tasks, and the search for answers usually reflects a number of different perspectives (Kraft and Furlong 2015, p 87). Thus, Anderson (2011) notes that the definition of problems is often a political process whose outcome will help determine appropriate solutions. A clear and unambiguous definition of problems is critical for policy formulation (deciding on choices) and implementation of a policy decided upon. Jones (1970) observes there are many conditioning variables that determine the route of a problem to government. Some broad categories of variables – the consequences of an activity itself, the organization of those affected, the access to government or the agencies of those affected, and the nature of the policy process all determine whether a problem will receive government or its agencies consideration. Kraft and Furlong (2015) are concerned with the question of how problems generate interest in the first instance. Or put in another word, why do people pay attention to them, or why are they considered important enough to solve? Why do some problems command so much attention at times while others tend to be ignored? These questions they observed are at the center of the problem definition and agenda-setting stage of the policy process.

Agenda-setting results in a selection between diverse problems and issues. It is the stage where decisions are taken on the issues that are worthy of attracting attention of government. Agenda

setting is a process of structuring the policy issues regarding potential strategies and instruments that shape the development of a policy in the subsequent stages of policy cycle (Jann and Wegrich 2007). As observed by Howlett et al. (2009), what happens at this early stage of the policy process has a decisive impact on the entire subsequent policy cycle and its outcomes. But not many problems or issues make it to the agenda stage, at any given moment many issues are competing for social and political attention. Some issues or problems make it to the agenda stage, while some do not. According to Pinteric (2014, p 30) on daily basis, different policy issues are competing to get enough attention to be included in the agenda of decision-makers (government, parliament, ministries, sometimes even political parties). Basic interest of any issue is to get the highest rank on agenda as possible. By doing so, the issue secures itself higher priority in finding appropriate solution. Policies of higher importance are usually structural policies (economic policy, defense policy, fiscal policy) while other policies are given lower priority (e.g., wild life management policy). Development and definition of decision-makers' agenda defines also priorities of the whole society, based on value system of the society as well as on political power relations among participating actors. In the same manner, Parsons' (1995, pp 125–134) shows in his analysis of the discussion of R. W. Cobb, and C. D. Elder, *Participation in American Politics, 1972* and E. E. Schattschneider, *The Semi Sovereign People, 1965* that issues and their definitions are dimensions of the policy process which require close attention. An issue will come to be placed in a context or policy setting, and the kind of context defines its place in the arena of political conflict and the strategy of those involved in managing the scope of conflict.

Policy formulation involves developing pertinent and acceptable proposed course of action for dealing with public problems (Anderson 2003). It involves identifying the technical and political constraints on state action. It involves recognizing limitations, which uncovers what is infeasible and what is not (Howlett et al. 2009). At the policy formulation stage of the policy cycle, problems and demands are transformed into government policies and programs considering options available to the policymakers. Policy formulation is a stage where decision-makers decide on the appropriate solution to address the identified problem (s). Cost and estimation of the effect of solutions are also considered and analyzed at this stage.

Implementation commences after the decision to adopt a particular course of action (policy formulation) is made. As defined by Jones (1984, p 166), implementation is the set of activities directed toward putting a policy and program into effect. It involves three activities – organization, interpretation, and application. Organization is the establishment of resources, offices, and methods for administering a program. Interpretation means translating the program's language – the plans, directives, and regulatory requirements into language that those affected can understand. Application is the "routine provision of services, payments, or other agreed upon program objectives or instruments." These are to ensure that policy decisions are carried out as planned and to have desired impacts. This explains the reason why Anderson states that the study of policy implementation is concerned with the agencies and officials involved, the procedures they follow, the techniques (or tools) they employ, and the political support and opposition that they encounter (Anderson 2011, p 209).

Policy evaluation refers broadly to the stage of the policy process where an assessment is made of how a public policy has actually performed (Howlett et al. 2009), or whether policies and programs are working well (Kraft and Furlong 2015). Evaluation is an objective assessment of a policy being implemented. This may be done using different criteria depending on the nature of the policy being evaluated. Adolino and Blake (2001, pp 26–27) are of the opinion that the potential criteria for evaluation are diverse. Sometimes evaluations focus primarily on the nature of policy outputs – that is, the resources government uses to address a problem. Other focus on policy outcomes, that is, examining whether government action has produced desired objectives. Evaluation can also focus on policy efficiency, asking whether current policies constitute money well spent. The essence of doing evaluation is to assess the extent to which a public policy is successful in

terms of achieving identified objectives. In essence, policymaking can be described as a complex multilevel activity. It is a complex ongoing process that stretches over long period of time and involves many interests and participants, which may vary along the course of time (Parag 2006). The comprehensiveness of policymaking is borne out of the activities that take place at the various stages of the process. In any process, there are tools and techniques of rational decision-making that can assist policy-makers in performing their tasks. At the same time, there exist many environmental factors that influence the emergence of public policy.

Public policy has its environments (social, economic, cultural, political etc.). These variables shape the outcome of policy process and determine what is feasible. In Anderson's (2011) view, policymaking cannot adequately be studied apart from the environment or context in which it occurs. And as rightly observed by Kraft and Furlong (2015, p 12), public policy is affected by social and economic conditions, prevailing political values and the public mood at any given time, the structure of government, and national and local cultural norms, among other variables. They determine which problems rise to prominence, which policy alternatives receive serious considerations, and which actions are viewed as economically and politically feasible.

## Understanding the Political Context of Policymaking

Public policy emerges in response to policy demands, or those claims for action or inaction on some public issue made by other actors – private citizens, group representatives, or legislators, and other public officials – upon government officials and agencies (Anderson 2003). This is reiterating the fact that several actors partake in policymaking and therefore suggesting multiple interests which may conflict in the process. According to Kraft and Furlong (2015), conflict arises when policy actors have differing views about the substance of public policies or whether government intervention is justifiable at all. That is, government has to make a choice over competing objectives all of which are desirable and pointing to addressing public policy problems.

It may be impossible to understand public policy without considering politics, which affects public policy choices at every step of the process of policymaking, from the selection of policymakers in elections to shaping how conflicts among different groups are resolved (Kraft and Furlong 2015). On one hand, policymaking involves deciding on choices to make among conflicting values represented by varying actors in the process. It is important to know that policy makers try to be as rational as possible in the process, analyzing the cost-benefits, and consequences of options, engaging in risk assessment analysis, among others, to arrive at what can be referred to as optimal decisions. On the other hand, which value(s) gets preference is determined not so much by rational consideration by the policymakers at all times. What counts as important is political expediency which incremental decision-making approximate. To Anderson (2011), it is easier to reach agreement when the matters in dispute among various groups are only limited modifications of existing programs rather than policy issues of great magnitude or of an "all-or-nothing" character. The political feasibility of a particular policy weighs in the determination of feasible policy options or alternatives from which policymakers can choose from. This is more so as decisions and policies are the product of give and take and mutual consent among numerous participants ("partisans") in the decision process (Lindblom cited in Anderson 2011, p 129). Kraft and Furlong (2015, p 475) thus emphasize that "political conflict is endemic to policymaking, almost all policies represent a compromise on the goals being sought as well as the policy tools proposed to achieve them. Compromise means that the policies are likely to be only partially effective and that the debate over further changes will continue." In other words, policymaking can never be finished as implementation of policy/program may generate other problems which will ultimately be requiring further government's intervention. Opposition to government policies may arise from interests that feel adequate and appropriate solution(s) to a problem(s) was not sufficiently canvassed. Some other groups may exert

pressure in opposite direction away from formulated policy and ultimately demand for policy review or modification – the reason why Smith and Larimer (2017) note that policy outcomes are not the final say in the policymaking process. Rather, multiple actors within and outside of government are constantly seeking to influence the government agenda, resulting in a highly dynamic and highly complex process. Most especially, policy actors in policymaking often are likely to negotiate, "give and take," and compromise to reach a mutually acceptable position or engage in convincing others of the merits or soundness of their positions, or the benefits that will accrue to them or their constituents if they accept it, or some combination of the two (Anderson 2011, p 147). It suffice to say that the process of policymaking is political, and to cite Laswell again involves "*who gets what, when and how.*" Policy is ubiquitous in the policy process (from agenda setting through implementation and evaluation) shaping and determining the policy outcome just as the nature of policy also determines the intensity of politics therein. Mead (2013, p 390) expresses it succinctly that policy and politics each provides a critical perspective on the other. "Political leaders constantly struggle to reconcile policy and politics. That is, they must somehow square what they want to do with what the political system will allow them to do. What they think is desirable 'on the merits' must be reconciled with what they can get accepted by other politicians and them implemented by administrators." Analysis in terms of what constitutes the problem of a policy issue, what options are available to solve the problem, what resources (personnel and organization) are readily available for implementation may also include political decisions (Mead 2013). Ultimately, decision in the policy process is determined by the interactions of many variables including the political.

## Conclusion

The core of the exposition in this entry is on public policy and politics. The discourse focuses on the intersection of politics and public policy. It is possible as already espoused to say that policymaking can be seen and understood in a political context. Policy like politics involves taking decisions among competing interests and allocating resources which often may be limited. Public policy cannot operate in a world of pure rationality, but will rather accommodate bargaining, negotiation, consensus building, and compromises among policy actors in a bid to solve societal problems.

## Introduction

The physical sciences—physics, chemistry, geology, astronomy, and, as an applied science, engineering—have interested governments seriously for centuries. The life sciences have interested governments seriously only for decades. Today for public policy purposes, the life sciences are avidly encouraged, scrutinized, studied, and regulated, but they are also underappreciated, their past influence enigmatic, and their present abilities too hard to explain and too easy to fear.

## Main Text

### Political Philosophy

Public policy itself, in a Western world meaning, owes far more to the life sciences than ordinarily recognized. Political liberalism—in a fundamental civil liberties sense, not a party-label sense—was a product of the scientific revolution of the seventeenth century and found its clearest, most forceful, and most enduring expression in the work of the English physician John Locke, a leading coconspirator in that revolution. Not all philosophical contributions from the life sciences have been of similar quality. Aristotle, the father of biology, contributed a tragic rhetorical tautology, the theory of natural slavery. Rudolph Virchow, master pathologist, progenitor of social medicine and "social science," debunker of racism, pioneering anthropologist and archeologist, cofounder and leader of the German Progressive Party, and member of the Reichstag, innocently offered a metaphor, *der Zellenstaat*, "the cell state," which ultimately, in others' hands, helped put the life sciences in service to genocide. Ernst Haeckel, marine biologist and founder of ecology, organized an all-German nature religion that grew to be a protofascist cult. Social Darwinists left a dark and persistent stain on evolutionary theory, and eugenicists, who ruined lives through forced sterilization, institutionalization, and euthanasia, cast a broad shadow over reproductive technologies yet to be invented. The non-liberal paths followed by certain life sciences factions were eagerly abetted by the public policy practitioners of the day and led to grievous errors. Propitiously, though, and despite paroxysms of nativist objection, the path cleared almost four centuries ago by Locke remains "modern" in progressive countries (Sprinkle 1994a, 2017).

### Transnational Politics

Entry of the life sciences into transnational politics is usually traced to 1859 with Henry Dunant's efforts to save thousands of wounded French and Austrian soldiers left to die after the Battle of Solferino. The International Committee of the Red Cross was the eventual product of Dunant's motivation. A parallel provenance might cite the African missionary movement, personified by Drs. David Livingstone and Albert Schweitzer. *Médecins Sans Frontières* (Doctors without Borders) now merges and exemplifies these traditions and has given fuller meaning to "the responsibility to protect" than the global political community has. Along an orthogonal line, the life sciences have shown how weapons could be biological, and major powers have examined the possibilities, always to condemn their pursuit but sometimes also to pursue them (Sprinkle 1994a, 2003). Possibilities, of course, are always expanding, as startling gain-of-function experiments and disquieting "gene drive" projections remind national security advisors in ambitious life sciences states.

### Human Origins and Variation

Another life sciences field whose effect on public policy is likely to be overlooked is the study of human origins, migrations, settlements, and appearances. Insights from this field constantly push against any temptation to credit racist or social Darwinistic claims, however softly voiced. For example, variation in skin pigmentation is

now known to be a complex and highly sensitive function involving two fractions of ultraviolet radiation, the activation of one vitamin, the dietary availability and photo-protection of and metabolic competition for a second vitamin, the latitude and altitude and angle of ultraviolet exposure, the clarity of air and sky, the reflectance of terrestrial surface, and the efficiency of tanning (Jablonski and Chaplin 2010). Similarly, variation in facial conformation from one people to the next is now known to be less plausibly the product of adaptive evolution than the product of genetic drift; such variation is just family resemblance on a grand scale (Ackermann and Cheverud 2004). As human variation, along many spectra, becomes a more familiar topic, then public policies that accommodate mobility—across borders and from one social stratum to the next—become more comfortable to propose and implement.

### Human Behavior

*Personal* Much is now known about how people behave and even why they behave in particular ways, even peculiar ways. Supposedly "irrational" behaviors are often turning out to satisfy, even to optimize, psychic needs unrelated to investigators' predictions (Oaksford and Hall 2016). Public policies would surely benefit from a surer grasp of these matters. Why do crowds stampede? Why do vandals vandalize? Why do firefighters underestimate risks? Why do motorists drive too fast in some settings and too slowly in others?

*Political* Civic behavior is being studied in new ways, as a topic in clinical psychology, neuroscience, and behavioral primatology. Methodology has often been problematic (Charney and English 2012), but some insights have been forthcoming. The most interesting have also been the most troubling, as they have shown not only how to understand but also how to change, to mold, political behavior.

*Criminal* Psychopathy and sociopathy are giving up their secrets, some genetic, some toxicological or in other ways environmental. While progress on these fronts must be taken as it comes, policy challenges will arise. Criminal offenders are disproportionally apt to acquire a psychiatric or behavioral diagnosis and, in an age of functional neurological imaging and genomic sequencing and receptor and regulatory chemistry, are apt to claim exculpation. With guilt being a state-of-mind determination, and with mind *per se* becoming a more nuanced concept, criminality will become harder to define and "corrections" far harder to design (Markowitsch 2008).

### Human Health

*Public Health* The public's health is assessed assuming a normal distribution of susceptibilities within identified groups: gender, race, age, occupation, and so forth. But susceptibilities are coming into tighter focus, even into single-patient focus, and risks are coming into correlation with susceptibilities at a molecular level. Currently, a single-person or small-cluster disease occurrence is usually seen as random and may seem unattributable to any specific cause, such as a chemical or radiant-energy exposure, because too few people have shown the same effect following the same exposure. Soon, this old "frequentist" understanding will be remembered with embarrassment and, unavoidably, regret. Susceptibilities within identified groups will be seen as genetic, even "genomic" in that vast expanses of our genomes are not genes coding for proteins but sequences coding for other products, many of which have recently been associated with regulatory functions. This picture will become ever more shaded as risks more often are acknowledged to come in mixtures and in series. Thus may increases in life expectancy—suggesting better habits and better care—finally be reconciled with increases in the incidences of particular diseases.

*Clinical Medicine* In every competent state, clinical medicine is an object of diligent regulation, but the manner and utility of regulation varies. Needing attention in most countries are nine modern problems:

1. *Depreciation of professionalism*. Professional decisions should be functions of professional judgments only. They have, regrettably, never been so, as every clinician knows. Temptation to betray professional obligation has always

been strong, as suggested by the history of ethics codes, but that temptation should not knowingly be increased, either in the interest of profit or systemic "reform." When clinicians acquire corporate obligations, whether by contract or acculturation, or when physicians and nurses and other clinicians are persuaded to call themselves and each other "providers" just as their employer or hospital or an insurance company may call itself a "provider," they are likely to find their service to patients altered in many ways, some superficial, others substantive. That service may be improved, as accountable care organization (ACO) enthusiasts in the United States say it has been or promise it will be, but in some circumstances corporate obligation—whether to an economic corporation or to a government—cannot believably be said to have improved professional service to patients. Clinician "gagging" is a clear example, and its two American forms should prove cautionary. One form has been a contractual pledge never to explain, or even to agree, that clinical services delivered by one's employing entity have been in any way inadequate. Another form has been a state-level law altering clinical communication, such as by requiring that no pregnant woman be told where she might seek pregnancy termination or by requiring that no parent be asked if any firearm kept at home is stored securely out of the reach of a young child or a potentially suicidal adolescent or adult. Professional standards since Hammurabi and Hippocrates and international legal standards since the Nuremberg Code prohibit physician action contrary to a patient's interest, and this prohibition is not negated by "orders," but local conditions may be sufficiently intimidating to make this point hard to assert individually (Sprinkle 2011).

2. *Inducement of excess demand*. This problem takes many forms. The "greedy physician" is one. The disingenuous pro-profit health insurer is another. Direct-to-patient drug-or-device advertising makes a third. Prolongation of dying is a fourth. Public policy solutions have been easier to apply in some countries than in others.
3. *Overt refusal of non-excess demand*. No one, professional or nonprofessional, individual or corporation, should induce demand for health-care goods or services beyond the point of zero net benefit to an individual patient or to an aggregate of patients, but neither should anyone refuse non-excess demand. In countries with comprehensive national health systems, "non-excess demand" may be defined flexibly within a sensible range. In the United States, with its mixed public-and-private system wherein financial competition among private insurers has been used—unsuccessfully, on the whole—as a "market solution" to a perennial cost-escalation problem, benefit standards vary in a socially regressive way.
4. *Covert refusal of non-excess demand*. Physicians and nurses are obligated by profession—in the original sense of that word—to encourage patients, directly or through their surrogates, to comply with sound preventative, diagnostic, and therapeutic advice; to invite decisions to forego minimally promising interventions, such as terminal care heroics; and to clear away administrative obstructions to honoring those decisions. This obligation to encourage creates an obligation to inform, fully and honestly, even if decisions to refuse non-excess demand have already been made legally by an insurer or politically by a public policy-making body. Professions do not serve policy; they push it. If that ideal is not being met, then professional judgment—a civil safeguard of the first order—is failing.
5. *Intensification of demand reluctance*. Many analysts have been impressed by the argument that systemic costs can be decreased significantly if individual costs are increased modestly, such as by copayments, deductible charges, and point-of-service penalties. Contrary arguments are several. First, the evidence that intensification of demand reluctance is clinically benign is indeterminate and likely to remain so. Second, intensification of demand reluctance, safe or not, is hard to accept bioethically in the present era of ascendent self-determination. Third, intensification of demand reluctance displaces clinical

judgment from physician to patient—indeed, from a physician to a sick, distressed, or worried patient. Though widely assumed to enhance "efficiency," this displacement must, ironically, offend any construction of the theory of comparative advantage.

6. *Erosion of trust*. Behavioral streams from many sources have combined to erode trust in health care, with misbehavior, malpractice, misrepresentation, and malfeasance common enough to affect expectations. In the United States, almost peculiarly, corporatism has been a cause, too, and it was especially causal during the "managed care" era. A frequent focus of suspicion, following numerous scandals and criminal convictions, has been the pharmaceutical industry, despite its many signal contributions to human well-being. Public policy has shared the blame here, sometimes by overplaying its role but other times—notably in the pharmaceutical case—by underplaying it. Professional responsibility among clinicians has been hard to boost, given the complexity of incentives deployed actively to undermine it over the last three decades. Professional responsibility, often hard to distinguish from professional arrogance, must sometimes, sad to say, be bypassed as a remedy.
7. *Misdirection of research-and-development effort*. Health care progresses when lower net-benefit goods and services are replaced with higher net-benefit goods and services at lower cost or at affordable incremental cost. Research-and-development policy is optimized when available resources are deployed to increase net benefit solely within the limit of patient acceptance—before a patient's "point of last demand"—rather than also beyond that limit, where technological change is of no practical importance and research-and-development efforts are, therefore, wasted. This latter criterion is met only by real improvements in goods and services.
8. *Defection from research support*. Free economies require the pursuit of profit, and this pursuit must often enough and bountifully enough and quickly enough be successful to entice new entrants and, in turn, their backers. But the life sciences research economy is only partly "free." Success is too important, its prospect too slim, and its pay-off too tenuous and distant to remove "the public" from the backers' front rank. Public policy, then, must both lead and follow, all the while guaranteeing that efforts designed to cut costs in clinical care do not promote free-riding on research-and-development efforts. When academic medical centers and academically inclined practices compete commercially with *nonacademic* medical centers and academically *disinclined* practices, several effects follow. The academic come increasingly to resemble the nonacademic. Innovative goods and services find fewer buyers, fewer "early adopters," and purchasers become reluctant to accept recently experimental care as currently standard care. Less research and fewer clinical researchers, fellows, and residents are subsidized informally, with centers and practices demanding full compensation for time, trouble, and opportunity costs. Less basic investigation occurs, with commercial funders being pressed to study only those hypotheses with near-term market potential and public and not-for-profit funders being pressed to emphasize the development of "cost-reducing" technologies. Not all research makes sense, not all research budgets are sensible, not all training programs are needed, and not all new technologies will prove their worth. Public policy officers schooled reflexively to fear "industrial policy" should avoid assignment to the health sciences.
9. *Overexpansion of the health-care economy*. This ninth problem would seem most amenable to public policy remedy but often proves intractable politically. The United States, even following implementation of its "Affordable Care Act," has not found the will to control its spending, which is, though, spending on itself, in its own interest, almost entirely in its own economy, and generating considerable export earnings. Why such prejudice against this particular economy? Because too many people make too much money taking care of too many people who make too little money

and are, necessarily, supported in their care by still other people who make too little money to afford their own care plus others' care. The United States, itself the single greatest purchaser of health care in its supposedly private system, has denied to itself the option not to pay high prices. No clearer sign of political corruption can be found in a law-abiding country (Sprinkle 1994b, 2001).

### Human Reproduction

Public policy's engagement with human reproduction, and therefore with all subjects sexual, has differed drastically from one country to the next, from one era to the next, from one issue to the next. While once nearly unmentionable even in private, human reproduction is now among the most public of topics and among all those topics regularly force-marched into the public square among the most vociferously and violently contested. Even purely as a technical matter, human reproduction has topped the list of fields transforming societies rich and poor, with little about the last half century making much sense absent the reliable control of fertility. The topic range here is extreme: prenatal screening for genetic defects or for sex selection; abortion as eugenics; abortion as birth control; abortion as a crime committed simultaneously by a woman and her physician (Hitt 2006); abortion as a right; maternal mortality for want of midwifery; vaginal fistulas chronically unrepaired; female genital mutilation; rape, gang rape, date rape, and rape as a weapon of war; honor killing; gender identity, gender preference, and gender reassignment; decline in sperm count and quality as explained by toxic chemical exposure *in utero* (Mocarelli et al. 2011); gendered play correlated with toxic exposure *in utero*; premature labor as a consequence of sexually transmitted disease; intensive care for extremely premature babies; infertility treatments resulting in the storage or destruction of excess human embryos (Gurmankin et al. 2004); animal and potentially human cloning; and the portentous prospect of attempting to correct germ-cell defects through gene editing—which, for somatic-cell defects, is an extremely promising technology (Kaminski et al. 2015).

### Agriculture

Food's production and agriculture's nutritional, toxicological, environmental, economic, microbial, and—most food animals being raised in miserable conditions—moral effects are core topics for public policy review and regulation. High-input agriculture has long since become "conventional" and, as such, presents demonstrable risks on and near, if not off, the farm; selection and dissemination of antibiotic-resistant bacteria is one such risk. Genetically modified organisms (GMOs), mostly crops modified to survive exposure to weed killers, have increased in prevalence and controversy, especially since the weed killers involved appear to be more dangerous than originally thought, especially in their commercial formulations (Defarge et al. 2016). GMOs' status as patentable and the methods used to market GMOs and to protect their patents have been resented in many societies, in part because modifying genes may "flow" to downwind fields where horticulturally bred genomes or related native varieties may themselves be permanently changed.

### Environmental Risks

All environmental policies are biological policies, whether they address living things directly or indirectly. Many of these policies, be they popular or unpopular, are quite well known and need no elaboration. Other issues for policy-making consideration deserve compensatory mention, however brief. First, chemicals in surprisingly small amounts, and especially in mixtures, no longer seem dismissible as too dilute to be harmful. Second, the toxicity of chemicals tested individually cannot be equated to the toxicity of untested commercial preparations containing those chemicals. Third, routine whole-population epidemiology cannot resolve *in utero* risks associated with specific developmental stages. Fourth, the fate of chemicals in the environment cannot be understood in ignorance of microbial ecology; witness the oil-metabolizing "service" performed in 2010 by Gulf of Mexico microorganisms—bacteria and archaea—previously unknown to science, and then consider the danger posed to such organisms by the use of oil dispersants, which chemically are detergents.

## Conclusion

How should governments approach the life sciences? By intent? By method? By effect? As benefactor? As beneficiary? As regulator? Yes to all these questions. And yes especially to another and more critical question, one asked first at Nuremberg—explicitly then about medicine of the 1930s and 1940s but implicitly also about the life sciences of the future. Should governments insist that the life sciences be morally independent so that they can be held morally responsible? The answer then was yes, and it must be yes still.

# Public Policy Development in Iran, Theory of

Hassan Danaeefard
Faculty of Management, Tarbiat Modares University, Tehran, Iran

## Synonyms

Implication research; Implication study

## Definition

This is a study in which a public administration and public policy researcher study a problem that requires analysis of the implications of a philosophy, theory, model, or idea for his or her

field, field of study, or topic of interest; relies on the text of a philosophy, theory, model, or idea as a source of knowledge production; and asks specific as well as broad questions. The resulting data is mostly extracted in the form of words (or propositions) from the texts; analyzes texts to enumerate contributions and implications from the origin of implications (a philosophy, theory, model, or idea); and conducts a study in a subjective and reflexive manner.

## Introduction

This article introduces a new label, "Implication eliciting methodology," and grounds it within the debates on unobtrusive methodologies. Generally, "implication refers to the conclusion that can be drawn from something although it is not explicitly stated." There are various methodologies for conducting many kinds of research: for example, to examine the impact of on-the-job training on the productivity of human resources in public organizations that require an experimental research methodology; to investigate the correlation between policy research and quality of public policy call for correlation studies; and to understand the culture of a group, an organization, or a society, we use ethnographic research. We can also construct a theory of employees' indifference in a public organization by a grounded theory design. To understand the essence of the experiences of citizens, we use a phenomenology strategy. The question is, *which methodology will you adopt to research the "consequences of," "influences of," "applications of, "or "implications of "a philosophy, a framework, a theory, a model, or an idea for public administration and public policy?* If you ask what your methodology is to study the "implications of critical realism philosophy" for *public administration and public policy*, what would your answer be? There is a shortfall of methodology to answer the question. The author has coined such studies "implication eliciting studies" and marked their methodology as "implication eliciting methodology." Given the interdisciplinary nature of *public administration and public policy*, this methodology can play an essential role in producing knowledge underlying those areas. This paper aims to introduce the methodology and discuss its significance, necessity, steps of conducting it in practice, and its evaluation quality.

## Theoretical Foundations of "Implication Studies"

The scientific community's objective of public administration and public policy fields is to articulate, improve, and expand public sector knowledge. The produced knowledge can generally be categorized into two general categories, positive and normative sciences, although there are some narrower categories. In general, a positive theory attempts to explain how the public administration and public policy work in a value-free way, while a normative theory provides a value-based view about what the public and public policy ought to be like or how it ought to work; positive theories express *what is*, while normative theories describe *what ought to be* (Velasquez 2018, p. 2500). The first category refers to the produced knowledge about *what is*. The outcomes of such scholarships are articulating, understanding, exploring, and explaining the function of an experimental phenomenon. Scholars in all paradigms (positivism, interpretivism, realism, pragmatism, complexity, and chaos) study "what is." Instead, the second category (for instance, critical theory) point to the knowledge produced about "what should be."

Although all paradigms are based on their methods to build positive and normative knowledge about their phenomenon of interest, there are different ways to produce disciplinary and interdisciplinary knowledge. Therefore, scientific communities deploy various strategies to create such knowledge. The academic disciplines, including public administration and public policy that have their domain (Becher 1994) and different cultures (Lee 2007), study different subjects (Grieb 1974). Still, there are several ways for disciplines to interact with each other (Davis 2007) and gain insights from each other. So far, focusing on interdisciplinary knowledge (Pyenson 1997) has been the best way for

disciplines to interact. Still, implication studies enable public administration and public policy to use insights into the knowledge of far and near disciplines to acquire their discipline knowledge. Therefore the popular strategy is to borrow and derive from a study field to articulate, improve, or expand another study field. Borrowing is a general theory of practice among academic disciplines (Fellows and Liu 2020). Therefore, the knowledge exchange is mostly seen in inhomogeneous fields and sometimes heterogeneous ones. For instance, public and public policy comprise different disciplines (politics, economics, management, sociology, history, etc.). The homogenous disciplines of social sciences or natural sciences use the ideas of family fields. Heterogeneous fields of natural sciences and social sciences use each other as well. In this way, different disciplines can play a role in public and public policy growth.

Given that, all fields, including public administration, borrow concepts and theories from other areas in a way or so. Similarly, the public administration and public policy use ideas from fundamental fields such as psychology and sociology, on the one hand, and fundamental philosophies such as positivism, interpretivism, critical theory, postmodernism, chaos, complexity, and critical realism. In some fields, such borrowings are so popular that they balance their theoretical shortfalls by fundamental areas (like different philosophies). Such practice sometimes needs "horizontal borrowing," in which the scholars of public and public policy use concepts developed for studying other phenomena (Whetten et al. 2009).

The important question is how to borrow insights from other areas with a vertical or horizontal position relative to ours? The source of such uses may be written or verbal works of the scholars of a field. They are the schools, philosophies, paradigms, theories, models, techniques, and scattered ideas that may be adopted. Although some disciplines are the main feeders of others, philosophical ideas or philosophical traditions are vast sources of impact on all disciplines (either social, natural, or art). Still, family fields may also learn from each other. The worth of any scientific work (philosophy, theory, model, idea) is in its hidden philosophical element (Agamben 2009). The philosophical element points to the inner potential of work, making it potent for expansion and development.

## Types of Implication Eliciting Studies in Public Administration and Public Policy

We can distinguish two dominant designs of implication eliciting studies: the systematic procedure and the emerging design.

### Systematic Implication Eliciting Research Design

In this research design, the researcher first devises a conceptual framework of a topic and seeks implications for each component from a discipline, philosophy, framework, theory, model, or ideas. For instance, the researcher places the policy-making cycle (e.g., Dye 1998) comprising from (1) Identification of problem, (2) agenda setting, (3) policy formulation, (4) policy implementation, (5) policy evaluation, (6) policy change, (7) policy terminations as a basis for his or her implications study of complexity science for policy-making study. In this case, there must be a correspondence between contributions (critical points of complexity science) of complexity theory and implications of each contribution for each component of the policy-making cycle. Most implications studies focus on this approach, but there is an emerging approach in some cases.

### Emerging Implication Eliciting Research Design

In this research project, the researcher raises a general question to determine what ideas a particular philosophy, theory, or model has for its field of study. For example, what guidelines or implications does critical realism have for general policy-making? After studying, it becomes clear that critical realism has implications for the process of policy-making, analysis of public policies, and evaluation of public policies.

### The Steps of Implication Eliciting Study Methodology

The methodology is the process of conducting research (Creswell 2015), and the method is the tools used for different steps of methodology. In other words, the method is simply a research instrument. The methodology is the justification for using a particular research method. The term "methodology" is used for implication studies as different methods may be used for different phases of such studies. The methodology of implications research can justify using specific methods in the stages as a theoretical framework. Although it is essential to follow some research steps, the process is not carried out in the non-linear irreversible form in practice. Still, there are backward and forward movements between steps to accomplish a more reliable and valid outcome. Implication eliciting studies pass through phases, but those steps are not linear in general, and there is a frequent tradeoff.

1. **Determine the Suitability of Implication Eliciting Study**
   "Implication research methodology" is suitable for studies where you decide to elicit primary guidelines for your research area or field of study from contributions of a general or sometimes specific field, a school, a philosophy, a framework, a theory, a model, or an idea. Therefore, this methodology does not seek experimental research (exploring, explanation, and understanding) because its objective is eliciting implications. It, therefore, seems suitable where the researcher is looking for borrowed knowledge. The "implications eliciting methodology" is applicable for researchers capable of cognitive organizing and eliciting ideas from other fields to use in their specialty. These people have a good mastery of the origin field (philosophy, framework, theory, or model) because eliciting critical ideas from other areas to be adapted is too difficult for novice researchers. To achieve success in this methodology, the researcher should master qualitative research methodology in particular quantitative research.
2. **Determining the Source of Eliciting Implications**
   Generally, there is an exporting and an importing source of ideas in "implications eliciting research." For instance, public administration and public policy are an importer of sociological concepts to its research domain. The public administration and public policy-making (importer) seek guidance from critical realism (exporter) to boost its knowledge.
3. **Defining a Process for Extracting Implications**
   As the purpose of "implication eliciting research" is to devise the implications of key ideas from philosophy, a framework, a theory, or a model for the applicant's field, it is necessary to identify and determine an ad hoc primary process for "implication research." The process may change during the research, but the researcher needs a procedural outlook. The process must originate naturally from the research problem and questions to validate the implications.
4. **Determining a Conceptual Framework for the Destination of Application of Implications**
   The first question that arises for the implication researcher is what topics the implications are focused on. In other words, what do you mean when it is said that the researcher wants to draw the implications of critical realism for the public administration and public policy?

   In such a case, the researcher has two choices to choose from:

   1. **Systematic approach**: The researcher articulates a conceptual framework for borrowing ideas from the lender and elicits appropriate implications for each of the conceptual research components. Going back to the example of critical realism's implications, the researcher selects the policy-making cycle (identification of a problem, agenda-setting, policy formulation, policy implementation, policy evaluation, and policy change and policy termination) and asks critical realism

about implications for each of the components.

2. **Emerging approach**: The approach allows the lender to shape the implications of a discussion topic without a predefined conceptual framework. In other words, the implications address the subject and its components on an emerging basis. Therefore, different implicative propositions may be elicited, not necessarily based on the predefined conceptual framework.

5. **Choosing a Theoretical Sampling of the Source of Taking Implications**
The critical point in collecting data for "implication eliciting methodology" is focusing on data enabling you to shape quested implications. Although "implication eliciting researchers" and theorists may use different types of data (interview, text analysis, etc.), many researchers rely on written texts in the best possible manner to elicit implications. A characteristic of "implication eliciting research" is that the researcher embarks on collecting data more than once because he returns to his/her data source to collect richer and more data. Therefore, the process does not have a precise timeline, and the researcher continues to collect data until the implications are sufficiently comprehensive. The sampling of texts is theoretical. Therefore, he/she selects a text or interview to help theorize the intended implications. Thus, theoretical sampling is, knowingly or unknowingly, used in "implication eliciting researches."

6. **Eliciting the Contribution of the Source of Taking Implications**
The key question in "implication eliciting research" is the implications of this philosophy, framework, theory, model, or old or novel ideal for public administration and public policy? In this line, the researcher may study firsthand resources and ultimately elicit a conceptual framework from critical realism ideas. The final point is that the elicited contributions may be uttered through propositions or expressions. The researcher must define the primary or secondary source of such contributions in one or several paragraphs to elicit his intended implication in its light.

7. **Validating the Contributions of the Source of Implication**
The validity of contributions is linked to the scholar's scientific credibility, and the scientific community will judge the contribution over time. Undoubtedly, the number of citations made to the contribution in different works confirms the contribution's validity. A scholar's contribution indicates his/her credibility, and its essential credibility relies on the reasons behind that contribution. A practitioner or a researcher wishing to select a systematic approach for selecting contributions may follow another path.

8. **Fitting Contributions of the Source of Taking Implications and Conceptual Framework of the Destination of Application of an Implication**
Now that the elicitations' contributions are clear, if the researcher has determined a conceptual framework from receiving source, correspondence should be made between them. The researcher may draw a table and illustrate the connections.

In this style, the systematic approach is suitable. And the framework of contributions is compared to the conceptual framework. Sometimes, an emerging approach is adopted. There is no predefined conceptual framework here. The researchers allow data to show their emerging implications. There may be a predefined conceptual framework in this case, but the elicited implications may not cover the overall conceptual framework.

9. **Eliciting Intended Implications**
The researcher writes down the implications at this stage. The implications may be elicited in two states. The first time original implications and the previous implications expanded by the researcher. The former indicates an implications research, which is conducted for the first time on a given topic. All elicited implications are innovative, but there may have been rare cases of implications research on a topic. Having said all this, the core of "implications eliciting research" is embedded

in this phase because previous steps provide the ground for this step.

10. **Validation of Elicited Implications**
The validity of elicited implications for essays sent to academic journals will be determined by peer review. On the one hand, the logic of implications and their citation power may be decisive in determining their validity. Therefore, the researcher can evaluate the level of agreement or disagreement of the experts in the field of study by compiling a questionnaire consisting of the contributions (critical points) and their elicited implications and the reasons for their opposition. The researcher can report the experts' contributions and explanations in the form of a table or narrative propositions and ask them to express their general opinion. Meanwhile, any researcher criticizes the implications based on his assumption based on Weick's (1989) tradition and tries to present plausible and justifiable implications.
11. **Reporting the Research Report**
Research chapters of implication study can be listed in this manner:
    1. Chapter I: Introduction
        - Introduction
        - Problem statement
        - Primary research methodology
    2. Chapter II: Literature Review
        - Descriptive review of research literature
    3. Chapter III: Research Methodology
        - The process of conducting research
    4. Chapter IV: Analysis of Research Data
        - Contributions
        - Implications
    5. Chapter V: Discussion and Conclusion
        - General findings of the research
        - Explanation of findings
        - Limitations
        - Future researches

## Conclusion

We claim that many public administration and public policy studies gain insights from the philosophies, theories, models, and ideas of other disciplines and fields. These insights can be the source of expanding knowledge in various areas of public administration and public policy. Many of these insights have become rich books in the field of public administration (e.g., Ongaro 2020) and public policy (e.g., Morcol 2012). Although the methodology of obtaining implications by the authors of these works is not transparent, all of them have implication research characteristics. On the other hand, implication studies are the beginning of research on new topics (philosophies, theories, and ideas) that scholars and researchers seek to bring into management. Accordingly, works whose essence is implication research are the basis of empirical research in public administration and public policy.

# Public Policy Entrepreneurship

Leonardo Queiroz Leite
Getulio Vargas Foundation, Sao Paulo School of Business Administration FGV/EAESP, Sao Paulo, Brazil

## Synonyms

Entrepreneur; Innovation agent; Public entrepreneur; Public entrepreneurship

## Definition

Public policy entrepreneurship is the process through which a central actor, the entrepreneur, promotes change, diffuses innovations, and exercises transformative leadership in the field of public policies.

## Introduction

In recent decades, research carried out in public administration field has highlighted the essential role that public policy entrepreneurship processes play in the production of wide-ranging policies. Even though entrepreneurs are understood differently in these studies, its performance is considered essential for the emergence of a public policy, its continuity or change. Thus, this entry essay analyzes the concept of public policy entrepreneurship. In the literature, it has become evident that entrepreneurial process in public policies is fundamental to explain why innovations and change occur. In this sense, it is also crucial to understand the profile, typical actions/strategies and motivations of the actors that lead the process of public policy entrepreneurship: the policy entrepreneurs. Therefore, this text shows the importance of this concept as an explanatory mechanism of the policy entrepreneurship for innovation and change within public administration.

In the past few years, debates around the role that specific actors play in the public policy construction process increased in the research agenda of the scientific field of Public Policy and Administration. Instead of focusing in the prescription of techniques and methods to transform individuals and organizations in entrepreneurs, these studies establish a narrow focus on the analysis of the individual action of these agents in technical and political processes (Leite 2014; Leite and Capella 2015).

In this sense, it is crucial to highlight the importance of individuals who play a key role in the emergence and dissemination of innovation in the field of public policy. In this approach, entrepreneurs have been identified as key players in the entrepreneurial process. Therefore, the focus on the entrepreneur's action shows that individual action is an important dimension of policies production. His/her skills in the defense of ideas, negotiating with different groups in the search of institutional bases of support for their proposals are essential to understand the changes. (Capella 2012).

The entrepreneurs are individuals whose main characteristic consists of the pleading of an idea. Such entrepreneurs may be positioned anywhere in a policy community, either inside or outside the government, and apply their resources (time, energy, reputation, funds) in defense of certain proposals. Three characteristics are highlighted by Kingdon (1984) regarding the qualities of an entrepreneur. First, *they are individuals who show credibility to the audience*, i.e., who hold legitimacy possibly due to factors such as their specialty in the subject matter (*expertise*), their communication skill, or their formal position in the decision-making process. The second characteristic of an entrepreneur is related to his/her *political connections and negotiation skills*. At last, the *persistence* is appointed by the author as

the third vital characteristic for the entrepreneur's activity, entailing the investment availability of big amounts of personal resources.

Beyond the important remarks about Kingdon's understanding of the entrepreneur's role, we finally underline the traditional function attributed by Schumpeter (1942) to the entrepreneur: the innovation, i. e., the "introduction to the new." Innovation may derive both from the introduction of nonexisting production factors and the recombination of existing factors, resulting in a new arrangement. Innovation related to production factors in Schumpeterian thinking gives place, in the studies on public policies, to innovations associated to the world of ideas.

## The Concept of Policy/Public/Political Entrepreneur

Policy entrepreneurship (PE) can be considered as analytical lens interrogating the actions taken by political actors aimed at bringing about change in public policy. As a result, here we have the concern with the development of clear and accurate concepts, considering that PE has suffered from conceptual imprecision because the term "entrepreneur" has traveled across disciplines, because it has been used with many "modifiers" (policy, public, political, institutional etc.) and also because PE is as much about the individual actor (entrepreneur) as it is for the process (entrepreneurship). (Petridou 2014; Roberts and King 1991).

In this sense, concerning the conceptual interpretation of entrepreneurship in the public sector, we face a major challenge: the literature also defines public entrepreneurs in many different ways, for example: as policy entrepreneurs, political entrepreneurs, program entrepreneurs, bureaucratic entrepreneurs, administrative and executive entrepreneurs, issue entrepreneurs, ideational entrepreneurs etc. Therefore, the concept of *entrepreneurship* has diffused into scholarly discourse that deals with public policy and management and since the 1980's, many studies have used this idea to clarify diverse case studies and policy results.

Concepts such as *political entrepreneur*, *institutional entrepreneurship*, *public entrepreneurs*, *policy entrepreneurs*, *evolutionary policy maker*, and *executive entrepreneur* (Roberts and King 1991) are being used by many scholars as a new perspective for understanding different phenomena related to the worlds of politics and administration. However, it seems that the literature often uses the same concepts to explain various phenomena, making it difficult to clearly define and understand policy entrepreneurs (Cohen 2012, p. 2).

Indeed, seldom are these terms precisely defined, much less distinguished from one another. Therefore, interpretation becomes particularly difficult when researchers use the terms interchangeably without clarifying either meanings or if and how the terms can be distinguished from one another (Roberts and King 1991). In this way, considering the lack of unanimity in the literature, here in this paper we try to clarify this debate by discussing briefly what advances on some recent studies were made in that direction. Thus, first, it is relevant to consider here an important attempt to deal with the lack of conceptual clarity that makes distinctions between public entrepreneurs and other actors involved in the policy process problematic:

> A "public entrepreneur" not only must have an innovative idea (which tends to be the domain of the policy intellectual), but also must design and translate that idea into a more formal, explicit statement. Working with those who have the formal power and resource control (typically referred to as policy champions), the public entrepreneur seeks acceptance of the innovative idea in law or executive fiat, and the eventual implementation of the innovative idea into practice. This distinguishes public entrepreneurs from others in the policy process because the former are involved in three phases of the policy process-creation, design, and implementation – as they promote their innovations. (Roberts and King 1991, p. 151)

Hence, we can affirm that the "entrepreneur" is that actor who runs and leads the process of change by introducing innovation, what approximates this approach from Schumpeter's (1942) classical definition of the entrepreneur as the essential agent of change that produces the so-called creative destruction as a way to establish the new.

In this sense, according to Roberts and King (1991, p. 148), some of the *key features* that generally defines "public entrepreneurs" are: (a) advocate new ideas and develop proposals; (b) define and reframe problems; (c) specify policy alternatives; (d) broker the ideas among the many policy actors; (e) mobilize public opinion; (f) help set the decision making agenda.

Moreover, in a systematic theoretical effort to define same "types" of entrepreneurs, especially in terms of their behavioral patterns, Roberts and King (1991, p. 152) suggests to divide public entrepreneurs into four different types, what could help to distinguish then between some key features:

(a) *Political* entrepreneurs, who hold elected leadership positions in government.
(b) *Executive* entrepreneurs, who hold appointed leadership positions in government.
(c) *Bureaucratic* entrepreneurs, who hold formal positions in government, although not leadership positions.
(d) *Policy* entrepreneurs, who work from outside the formal governmental system to introduce, translate, and implement innovative ideas into public sector practice.

Regarding this specific point, it is worth to deep the distinction between the "political entrepreneur" and the "policy entrepreneur." The term "political" entrepreneur, as an explicit concept, was developed by Dahl (1961, *cited by* Hogan and Feeney 2012) that states that the political entrepreneur is *the* crucial agent of change and "is not so much the agent of others as others are his agents." To put it in another words, the political entrepreneur rules the changing policy process and interact directly with other actors, by leading and controlling then somehow: the political entrepreneur picks and chooses from policy ideas put forward by policy entrepreneurs at times of crisis and shapes the terms of political debate by influencing agendas and constructing cultural frames. They "exploit moments of instability" created by exogenous shocks and "invest resources in the creation of a new policy, or new forms of collective action," having "transformative effects on politics, policies, and institutions" (Hogan and Feeney 2012, p. 2).

When it comes to understand the behavior and conduct of the various "types of entrepreneurs," we must note some important clarifications concerning the action of these actors. Mintrom (1997) used the term "*policy entrepreneur"* and suggested a wider definition that does not require the direction and flow of politics to change. According to him, entrepreneurs are simply "political actors who promote policy ideas" and "people who seek to initiate dynamic policy change." (1997, p. 738–739).

In this vein, based on a number of important contributions about policy entrepreneurship, Mintrom and Norman (2009, p. 651) define *four key elements that characterize policy entrepreneurs action*: displaying social acuity, building teams, defining problems, and leading by example. The first two are strongly related to network approaches as policy entrepreneurs make good use of social networks – both inside and outside the jurisdictions where they seek to promote policy change, endorsing Kingdon's (1984) definition of the policy entrepreneur that highlights the PE insertion in networks.

And last, in order to clarify the idea of policy entrepreneurship, some authors suggest that this phenomena had to be studied in a manner that paid attention simultaneously to contextual factors, to individual actions within those contexts, and to how context shaped such actions (Mintrom 2000, 1997; Mintrom and Vergari 1998) In sum, Capella explains and complement the understanding about the role of advocacy that characterizes the PE:

> In order to play the role of an idea advocate, the entrepreneur gets involved with some identifiable activities, such as: the search for an strategic definition of problems; the arrangement of the discussion about a policy, offering alternatives for its conducting; the pursuit for establishing contacts with different groups, which makes it circulate inside a community of policies and beyond its limits; and, at last, the search for supportive institutional basis for their ideas. (Capella and Claudia 2012, p. 12)

Therefore, we realize that policy entrepreneurship is directly related to policy changes (Mintrom and Norman 2009) and to the diffusion of

innovation. Mintrom (1997) defends the relevance of policy entrepreneurs as actors aiming to promote a policy change by attempting to win support for ideas for policy innovation and to introduce them into the government's agenda. Entrepreneurs perform three specific functions according to Mintrom and Vergari (1996). First, entrepreneurs find "unmet needs" and suggest ways to meet them, and for such activity they need to be *aware of opportunities*. The second function *involves risks* (concerning their personal reputation, financial and even emotional resources) in which the entrepreneur gets involved in the search for actions that engender uncertain consequences. Moreover, at last, entrepreneurs *coordinate networks* involving groups of people and organizations, which are required to ensure the changes. This being so, entrepreneurs are not atomized individuals – on the contrary, they are (and need to be) inserted in social networks.

Last, the clearest standards to evaluate success and failure are still the ones used by Schumpeter (1942) and endorsed by Roberts and King (1991) that sustains that to an entrepreneur be successful, *he/she must sustain an idea that survives all the innovation process and is implemented in the end*. For sure, more research efforts should be made to upgrade these criteria using empirical data. In addition, the motivations behind the actions of political entrepreneurs remain opaque: they are thought to be more opportunistic than say, brokers, but research into motives remains scarce.

When it comes to analyzing the roles and specific features that defines the policy entrepreneurs and entrepreneurship, some important conclusions must be stressed: they are not "titanic individuals." We must bear in mind that the change in a policy takes place due to reasons that are out of the reach of the individual (like contextual factors, institutional determinants, political facts etc.) but it is him/her who "takes advantage of the opportunities."

## Conclusion

Thus, the emphasis on the role of the entrepreneur may be a way to contribute to the deepening of the understanding about the relations between the individual action and the institutional structure in the process of public policy formulation. In this way, the literature in general showed some relevant contributions in the empirical studies by analyzing teamwork and PE networking, highlighting that the policy entrepreneurs should not be understood as "lonely heroes." Therefore, policy entrepreneurs are central actors in the policy process usually characterized as skilled stakeholders aiming to make or prevail a particular vision of policy change by activating specific strategies that allow them to benefit from political opportunities or to overcome obstacles. In our study, we discussed some theoretical foundations of policy entrepreneurship, in order to allow us for a better understanding of this phenomenon and the specific role of this actor.

## Introduction: Issues of Public Policy in Algeria

Immediately after independence, the priorities of Algerian policy-makers were focused on a centralized planning process, piloted on a one-way, center-periphery model. Indeed, in a political system that quickly gave a key role to central administration, the political and economic systems were entirely run by central government, organized as a state bureaucracy. The aim was to consolidate economic independence by implementing a socialist model of development (Teulon and Bonet 2016) in which the public sector market would dominate the entire economy. This public approach was reflected in a socioeconomic program and national development plans which were a conventional means of agrarian reform and a policy of "industrializing industries," applied without exception throughout the country. It also involved almost total responsibility for costs related to education and health. However, public policy in Algeria has undergone major changes since independence. During the first phase (1962–1979), public policy focused on a planned and controlled economy that was designed as an instrument that could provide a quasi-definitive answer to the economic and social difficulties.

The second phase (1980–1989) was devoted to "self-adjustment" of the economy. It corresponded to the launch of action plans in all economic and social areas but concluded with major macroeconomic imbalances due in particular to two factors: a sharp drop in oil prices in 1986 and a situation where other sectors of the economy were unable to cope with being heavily subsidized.

The third phase (1990–1998) targeted the development of the Algerian economy and its integration into a free-market economy. The intention was not only to liberalize the economy but also to reduce government subsidies substantially (this impacted on prices and on free health-care services). This phase of adjustment corresponded to a public policy devoted to constructing a market economy. It was applied during the 1990s, when Algeria was facing social and economic difficulties and was obliged to adjust its policy and its government strategies to face global economic realities that could not be ignored and were essential for future development.

Finally, the fourth phase began in 1999 and is ongoing with the reestablishment of a "rentier economy" market resulting from increasing oil revenues. Public action has restored the fundamental economic balances, and most social indicators have returned to green, but with the continuing fear that the same causes could produce the same effects.

The purpose of this chapter is to analyze the four phases of Algeria's public policy development from independence in 1962.

## First Phase (1962–1979): National Development Plans and Central Administration

From 1962 to the mid-1980s public policy was aimed at building an administered economy

and egalitarian society. To this end, the central administration acquired a monopoly on virtually all economic and commercial activities. This economic planning process resulted in three plans:

(i) The first three-year plan (1967–1969) was an indicative program.
(ii) The first four-year plan (1970–1973) was a public policy backed by a theoretical model in order to diversify Algerian industry.
(iii) The second four-year plan (1974–1977) was launched after the nationalization of the oil industry in 1972; this coincided with the first oil crisis and the increase in hydrocarbon revenues, thereby strengthening the capacities of state action.

During this period public policy was mainly focused on activity control. Thus, in agriculture, it instigated the creation of the agrarian revolution and the nationalization policy for farms. Indeed, in 1971 Algeria strengthened the notion of the agrarian revolution by nationalizing properties that were not being exploited. In this way the state hoped to revamp the agricultural sector in order to boost production.

In the health sector, free medical care was established in 1973 by the central administration. Health-related costs were borne by the state budget and also by a social security system dedicated mainly to severe cases and intensive care (Kara Terki 2010, p. 47).

The controls applying to international trade relations resulted in fixing, in advance, the quantity of goods to be traded. This policy essentially aimed at protecting nascent domestic production "infant industry." The central administration therefore made it very difficult for domestic companies to import and completely banned access to foreign trade for private businesses. In its interventionist logic, Algerian public policy incorporated international trade into development policies.

In terms of investment, the policies sought to establish "industrializing industries" in order to speed development and reduce the investment gap between other industrialized countries. With the investment situation at this time being generally static, companies were entirely public.

## Second Phase (1980–1989): "Self-Adjustment" Policies and Public Action

Since 1980, the admission that public policy in favor of "industrializing industries" had failed led to replacing it by a move to industry support based on economic needs criteria. In the first half of the decade, the sharp rise in oil prices helped to initiate a state policy determined to reduce the national debt while still strengthening the educational, health, and social ambitions of public policy. Thus, in the areas of health, the Health Card was introduced in 1982 to provide a more equitable and harmonious distribution of health resources. It was marked by the development of specialized care in public hospitals: despite the great expense, this continued to be supported by the state budget and social security. Unfortunately this very positive trend would not last. Indeed, like many developing countries, the Algerian economy had, since the mid-1980s, suffered difficulties and major macroeconomic imbalances. These imbalances, the consequence of the dramatic decline in oil revenues in 1986, as well as the absence of expected results from agriculture and industry, pushed the government to undertake structural reforms and to change the direction of its policy radically. Reforms in this phase were also political in nature since they introduced a multiparty system and gave more prominence to individual liberties and freedom of the press. They were part of a policy of establishing mechanisms of a market economy and boosting integration of the Algerian economy into the world economy. This desire to change public policy was characterized by demonopolization and progressive liberalization of trade which resulted in a sharp rise in prices. This period marks the turning point in public policy as seen by the new interaction between Algeria and the Bretton Woods institutions and the establishment, in 1987, of a Structural Adjustment Program (SAP) imposed by the International Monetary Fund (IMF) in exchange

for its support (1989–1998). Thus, the beginning of the transition to a market economy was far from easy.

## Third Phase (1990–1998): Sustaining Public Action

In this phase, the main objective was to introduce amendments to the economic and social policies, unpopular in a "rentier economy." These were applied equally to public and private sectors, encouraging investment in non-hydrocarbon sectors, but with significant decreases in subsidization for the economy and social services. Hospitals and schools, like all social sectors, had to face a brutal "squeeze," characterized by ever higher demands on the population but with increasingly scarce resources. The consequences on their performance were dramatic, leaving a heavy legacy for Algerian society.

Economically, Algeria simultaneously adopted multilateral trade and bilateral strategies (Bouët 2006). A reform of its banking sector strategy was committed to strengthen market mechanisms and to reduce state intervention (Rajhi and Hatem 2011). The privatization policy of public companies, initiated by the 1988 law, was officially launched at this time, informing the Algerian population of the transition to a market economy. The new legal status of companies was codified officially between 1995 and 2002. The commitment of public policy was to increase the share of private companies in the fabric of the Algerian economy (Labaronne 2013).

## Fourth Phase from 1999 and Beyond

Algeria has lived, and is still living through, a radical transformation of its public policy since the late 1980s. The country's commitment to the path toward a market economy ostensibly frees entrepreneurial vocation (Ait Atmane 2015) but masks a serious deindustrialization (Nadji 2014). In fact, a crucial role in the functioning of the economy has been accorded to small and medium businesses (SMBs) thanks to the effective engagement of financial and tax incentives. The number of SMBs has quadrupled from around 250,000 in 2001 to nearly one million in 2011. However, these companies are mainly active in the areas of distribution of imported products and contribute little to economic development. As for the pace of privatization of public companies, the evolution is slow. This can be explained by the numerous contradictory strategies of those actors supposedly responsible for progress (Tahar 2010). It should be noted that during the first 15 years of this phase, oil revenues represented ratios of about 35–40% of GDP, from 65% to 70% of tax revenues of the state and around 98% of export earnings (Nadji 2014). In the agricultural sector, the country still has very low food security and remains a significant importer of agricultural products.

As for social policies, they are "basking" in a new golden age. The "rentier economy" has recovered the means of subsidizing the economy and society. Energy is focused toward balancing the public offer in both quantity and quality, throughout the entire territory. There are still, however, many obstacles to face, many of which seem extremely difficult to overcome. Indeed, pertinent reforms under the current "New Public Management" have been employed to streamline the use of resources and especially to introduce a results-oriented policy into government achievement objectives. They are up against the values embedded in the previous phase of public officialdom. Similarly, the system of formulating engaged public policy remains too centralized, a legacy of a bureaucratic culture of state planning. Decentralized action levels are rarely consulted, and decisions taken do not adequately reflect or measure local specificities: a situation very similar to observations in other "hybrid regimes" (Diamond 2002), combining democratic rules with a functional logic characteristic of authoritarian regimes (Bezes 2007). Furthermore, other problems, deficits, or malfunctions have been identified, relating in particular to the demands of accountability, respect for the ethical dimension in business affairs (Nadji 2014), and to the skills gap. The outcomes of the different social policies implemented remain somewhat below

expectations, especially in view of the resources dedicated to this program. This brings us to Oliver Williamson's premise that governance structures and institutions are interdependent (Williamson 1996). It is difficult to focus on a country's policies and their effectiveness without questioning the institutions which formulate those policies.

## Conclusion

Since gaining independence in July 1962, Algeria has been under an obligation to come up with public policies aimed at solving development issues inherited from colonization. With this in mind, central administration played and still plays an important role in the construction and direction of the national economy as a whole. Public policies have focused on all areas related to public welfare such as health, education, industry, agriculture, price controls, or international relations; the reality is that these policies have often brought only temporary and/or partial solutions for the economic and social difficulties targeted. If, indeed, the goal of any public policy is to create a system that strengthens social cohesion, that of Algeria has experienced some success but also many failures. This is the result of the government's inability to extricate itself from the dynamics of revenues directly linked to hydrocarbons.

The legacy of the 1990s during which the state, the public, the economy, and society as a whole experienced multiple shocks (economic, political, and social crises) was not resolved in the years that followed, despite all the efforts for reform. From a command or administered economy, the country has evolved painfully toward a market economy but has failed to wean itself off resources related to hydrocarbons. The recent fall in oil prices raises fears of reliving, yet again, the same difficulties as in the past because so far, no major public policy has achieved the goal of reducing the country's vulnerability and securing it against external shocks.

# Public Policy in Turkey: Success and Failure in Education Reform Policies

Hamza Ates
İstanbul Medeniyet University, Istanbul, Turkey

## Introduction

A major issue persisted in public policy analysis is policy failure and its reasons, as governments throughout the world seem to suffer periodic

policy failures (Bolaji et al. 2015; Coelho et al. 2015; Mantino 2013; UNESCO 2010; Fotaki 2010). This article explores this issue, taking Turkish education sector reform policy as the case study. It provides a way forward in advancing our understanding what is and what causes policy failure. However, defining failure seems bedeviled by a number of methodological problems including differing interpretations, gray areas, and politically driven explanations of policy success/policy failure. Having studied education policy processes of a large number of countries, Haddad and Demsky (1995) come to the conclusion that policy has multiple dimensions, often succeeding in some respects but not in others.

The article begins with a review of existing literature on policy evaluation and improvement and policy failure and success in order to identify what can be built on and gaps that need to be filled. Then, it moves on to evaluate education reform policies in Turkey undertaken by various governments. An interesting point which should be articulated here is that recent history of Turkey, from the Tanzimat period of the Ottoman State, can be understood as a history of education reform initiatives. A variety of reforms have been implemented then (Çelik and Gür 2013; Aksit 2007; Buyruk 2015; Simsek and Yildirim 2004). However, some the reforms were and have still been contradictory to each other. Therefore, a perception of policy failure in this field has been prevalent in Turkey. Although the pace of reform initiatives has been widened since 2002, when AK Parti came to power in Turkey (Aksit 2007; Çelik and Gür 2013), some of these, which are concerned with curricular and structural changes, have encountered serious difficulties. This article evaluates existing data on the results of these initiatives such as school demographics and the country's performance in some international education benchmarking studies.

## Policy Failure and Policy Success: A Conceptual and Theoretical Framework

The issue of policy failure is quite hard to define and reach a consensus among different stakeholders of a policy on what causes such failures. Perhaps, this is why disputes over whether a policy has actually "failed" are commonplace, particularly in Turkey. Exact definition of policy success and policy failure is hard to achieve, because policy success is in the eye of the beholder, depending on factors such as a protagonist's values, political stand, beliefs and extent to which they are affected by the policy, and assumptions of what constitutes success take many forms. For instance, foundationalist/scientific/rationalist tradition perceives policy success as a fact amenable to positive identification (Mc Connell 2010), while constructivist/discursive tradition emphasizes the importance of meaning and interpretation.

In countries like Turkey, social strata are quite divided, in a sense torn apart, and thus politics is frequently partisan. Therefore, policies are perceived as successful by some political actors while almost automatically rejected by members of the opposite political camp claiming that they are totally failed. Not only in Turkey, governments in many countries frequently encounter accusations of periodic policy failure. Some of most apparent policies which have faced the curse of suffering policy failure include Guantanamo Bay detention camp (USA), Watergate (USA), Poll Tax and Child Support Agency (UK), agriculture support policy (France), response to the global financial crisis (Iceland), and response to refugee crisis (European Union).

On the other hand, in government affairs the ideal of complete success is rarely met because of a wide range of externalities. Some shortcomings would infuse almost all policies. Further, relatively greater policies do frequently have multiple goals. Failing in some respects would not necessitate complete failure in all fronts; some aspects of a policy could be success stories, while the policy could fail in other respects (Mayhew 2015; Teodorovic 2008). "Furthermore, designing policies is not an exact science and involves some degree of judgment on level of resources needed, feasibility and clarity of goals, most appropriate measures needed for implementation and more. Misjudgments at the policy design stage can

create risks of future policy failures... Also, policies are designed without precise foreknowledge of how a policy will perform when subject to the multiple and interacting forces (economic, political, social, media, technological, demographic and climatic) that will shape its implementation" (McConnell 2014).

Having reviewed a large number of literatures on policy success and failure, Mc Connell (2010) arrives a definition of policy success: "A policy is successful if it achieves the goals that proponents set out to achieve and attracts no criticism of any significance and/or support is virtually universal." This definition recognizes the fact that government can attain the goals it seeks in each of its three realms of policy, process, programs, and politics (Table 1), in that what is needed for considering a policy is successful is different in terms of process, program, and politics points of view.

McConnell (2014) further identifies several methodological problems in defining policy failure, including differing benchmarks, gray areas, differing perceptions between pros and cons of certain policies, and variance over time. Identifying the causes of failure is also problematic because of a number of methodological problems, including the myth of the single causal factor, the varying degrees of causality, the bias of hindsight, and the role of judgment (Table 2).

## Education Policies and Policy Reform in Turkey

As an institutional and geographical continuum of the Ottoman Empire, the Turkish Republic was established in 1923, under the leadership of Mustafa Kemal Atatürk. The Turkish government of the time enacted a series of reforms which prioritized education as a way to leverage the nation's traditional social structure in a more western direction and to build national identity among varied ethnic subgroups. In 1924, education system was centralized under the Ministry of Education, religious schools were closed, and new secular schools were opened. In the Republic's early years, Turkey's literacy rate was less than 10%, while by 2010, Turkish adult literacy rate had increased to 89% (96% among men and 81% among women) (UNESCO 2010).

Currently, primary and secondary education is compulsory and free (Talim Terbiye Kurulu 2005). Education governance and funding in Turkey remain highly centralized. The Ministry of National Education (MoNE) is responsible for providing education not only for pupils but also for all its citizens who are willing to take further education. It appoints teachers and administrators and selects textbooks and curriculum subjects (Fig. 1 and Table 3).

In recent years Turkish education has experienced many changes. Although "the reforms are

**Public Policy in Turkey: Success and Failure in Education Reform Policies, Table 1** Three forms of policy failure

| Process failure | Program failure | Political failure |
|---|---|---|
| Government unable to produce its desired policy goals and instruments | Not implemented in line with objectives | Damages electoral prospects or reputation of governments and leaders, with no redeeming political benefit |
| Policy process illegitimate | Desired outcomes not achieved | Policy failings so high on the agenda that they are damaging government's capacity to govern |
| No building of a sustainable coalition | No benefit for target group | Unequivocally damages the broad values and direction of government |
| Opposition to process is virtually universal and/or support is virtually nonexistent | Inability to meet criteria highly valued in that policy domain | Opposition to any political benefits for government is virtually universal and/or support is virtually nonexistent |
| | Opposition to program aims, values, and means of achieving them is virtually universal, and/or support is virtually nonexistent | |

Source: McConnell (2014: 19)

**Public Policy in Turkey: Success and Failure in Education Reform Policies, Table 2** A framework for understanding different approaches to the causes of failure

| | Actor centered | | Institution/policy process centered | | Societal centered | |
|---|---|---|---|---|---|---|
| | Intentional cause | Unintentional cause | Intentional cause | Unintentional cause | Intentional cause | Unintentional cause |
| *Typical causal narrative* | Deliberate cultivation of failure, reckless self-interest | Bad luck, negligence, incompetence, poor judgment | Institution or process (e.g., department or policy-making process) was deliberately set up in such a way that failure was cultivated or allowed to happen in order to achieve other institutional/process goals | Institution or process (e.g., department or policy-making process) was inappropriately geared for decision making and hence produced failure through, e.g., institutional complacency, blind spots, inadequate process | Ruling ideas/ governing ideas/ powerful interests create failure in order to thrive – particularly to the detriment of those less powerful | Ruling ideas/ governing ideas/ powerful interests do produce failures but are small in comparison to greater benefits |
| *Foreseeability of failure* | High. Individuals knew what they were doing | Medium/high except which more capable individuals should have recognized, or low in the case of bad luck | High. Failures are foreseeable, but the institution or process was set up in such a way that some failures are accepted or even cultivated | High. Failures are foreseeable, but the institution or process was designed properly, limiting its capacity to foresee | High. Failure is built into, necessary and cultivated for the ongoing survival of ruling ideas/ governing ideas/ powerful interests | High. We know that failures happen as an unfortunate by-product of the way society works |

(continued)

**Public Policy in Turkey: Success and Failure in Education Reform Policies, Table 2** (continued)

| | Actor centered | | Institution/policy process centered | | Societal centered | |
|---|---|---|---|---|---|---|
| | Intentional cause | Unintentional cause | Intentional cause | Unintentional cause | Intentional cause | Unintentional cause |
| *Capacity to prevent* | High. Failure could easily have been avoided | Medium/high, if more capable individuals had been place a position of responsibility or low except in the case of bad luck | Medium. Better institution or design of policy process could have prevented failure | High. Better institution or policy process design of policy process has prevented failure | Low. Failures are symptomatic of deeper ideologies and systems of power | Low. Failures are deeply embedded in the ideas and interests which govern society, but such ideas and interests bring greater benefits |
| *Deeper assumptions about the connections between failure and society as whole* | Optimistic. The problem is "bad" individuals, and we can be confident that their removal from office (or making them subject to stringent controls) can help avoid policy failure | Realistic-optimistic. Either bad luck or individuals "not up to the job" are the problem. We can't do much about bad luck, but we can help avoid policy failure by removing them from office/provide them more training or subject them to greater regulation | Realistic/ pessimistic. Reform may be very difficult because aspects of failure are almost a necessary part of institutional and policy design processes | Realistic/ optimistic. Reform might be difficult but is possible and failure can be avoided | Pessimistic. The causes of failure are deeply embedded in dysfunctional systems of power | Realistic/ optimistic. While causes of failure are deeply embedded in the nature of society, the failures are outweighed by the broader successes they bring |

Source: McConnell (2014: 22)

presented as a means of improving education and securing better social life conditions, in reality they have led to a redefinition of the meaning and goal of education and an increase in educational inequalities" (Buyruk 2015). However, as Akşit (2007) rightly suggests, "Educational reform efforts in Turkey have been somewhat piecemeal, and have not generally touched core educational practices. Although various superficial modifications have been made in the past, most have not had the substantial effect hoped for. Fragmented changes were made, usually to gain political advantage, but the basic systems to a large extent stayed the same."

**Public Policy in Turkey: Success and Failure in Education Reform Policies, Table 4** Recent education reforms in Turkey

| |
|---|
| **A. Neo-liberalization of education** |
| 1. Privatization – increase the share of private schools in the primary education sector |
| 2. Increasing parental contributions to schools – MoNEtization/commercialization |
| 3. Creation of school-family unions |
| 4. Encouragement of entrepreneurial spirit (the emphasis in education has shifted from educating conscious citizens with humanist values to providing the basic competencies required by the market economy) |
| **B. Increasing religiosity** |
| 1. Developing a pious generation – preacher (İmam Hatip) schools |
| 2. Qur'an, life of the prophet and basics of the religion courses in general high schools |
| 3. Unlifting headscarf ban |
| **C. Democratization of the education system** |
| 1. Special courses for Alawis and religious minorities |
| 2. Increasing the number of elective courses |
| **D. Increasing the quality of education** |
| 1. 4 + 4 + 4 years pre-higher education time |
| 2. Harnessing information technology through such projects as Fatih |
| 3. Decreasing number of students per class |
| 4. Curriculum reform which intends to change considerably the focus and content of the whole national curriculum in three phases |

Source: Adapted from Altinyelken et al. (2015)

In 1997, Turkey extended compulsory basic education from 5 to 8 years (Basic Education Law, No. 4306), and coeducation became the norm (Koca 2009). With the impetus of increasing hopes for European Union membership in 2005, a large number of social and economic reforms were conducted, including some steps in education field. In order to increase education level of the citizens, Turkish government extended compulsory education to 12 years in 2012, by Law No. 6287.

Education reforms undertaken since 2002 have been summarized in titles in Table 4.

Education "reforms" have focused on two principal areas.

- The first of these is to focus on the reproduction of labor power linked to developments in the Turkish and global economy. The purpose and functions of education have been restructured on the axis of reproduction of competitive, flexible labor power equipped with the necessary qualifications to meet the needs of global capital.
- Defining education as a new valorization area for capital accumulation is the second focus. Thus, while on the one hand attempts to prevent the decrease in the total surplus value have been attempted by public funding cuts in areas such as education and health, on the other hand, education has become a new field for private sector investment. The teachers, who are the most basic actors of the education field, are expected to keep pace with this change process and even to be active agents of it.

Major dimensions of education policy implementation can be seen in Fig. 2, and some dynamics in the education policy implementation process can be seen in Fig. 3.

## Has Education Policy Failed? An Evaluation of the Reasons of Policy Success and Policy Failure

Increasing its children's access to education has been a Turkish success story (UNESCO 2010; Çelik and Gür 2013).

**Public Policy in Turkey: Success and Failure in Education Reform Policies, Fig. 2** Dimensions of education policy implementation (Source: ETF 2007: 15)

**Public Policy in Turkey: Success and Failure in Education Reform Policies, Fig. 3** Some dynamics in the education policy implementation process (Source: ETF 2007: 18)

- Preprimary education enrollments doubled from 1999 to 2007.
- Primary and secondary school enrollments increased from 1.3 million in 1971 to 6.7 million students in 2008, largely because of expanded compulsory education from 5 to 8 years.
- Seventy-four percent of Turkey's adolescents were enrolled in secondary education in 2010.
- In 2009, tertiary enrollments in Turkey were 46% of total population in 5-year age group following graduation from secondary school, up from 38% in 2007.

- The Turkish government, with collaboration of UNICEF in 2004, managed to decrease gender disparity in some provinces where enrollment level of girls is relatively low.

However, there is a major common belief among many quarters that education reform initiatives of Turkish governments as well as traditional education policies have failed in some respects, including equity and quality issues. For instance, while some primary and secondary schools are rated as among the finest education institutions of the world, academic knowledge level of the majority of the country's students is below average level of OECD, as PISA assessment reports suggest. For students of lower economic and social level, the disparity is even much higher (Figs. 4 and 5).

The figures above show that Turkey needs further improvement in both quality and equity of the education system. Although the country has made an apparent improvement in PISA assessments in mathematics (from 2003 to 2009) and science (from 2006 to 2009), it remains one of the lowest performers among OECD countries in reading, mathematics, and science, and the proportion of 15-year-olds who underperformed on the PISA 2009 reading assessment is above the OECD average. In addition, the impact of students' socioeconomic status on performance and the difference in

**Public Policy in Turkey: Success and Failure in Education Reform Policies, Fig. 4** Mean score in reading performance and percentage of low and top performers, for 15-year-olds, PISA 2009 (Source: OECD 2013: 7)

**Public Policy in Turkey: Success and Failure in Education Reform Policies, Fig. 5** Student performance in reading and relationship between student performance and economic, social, and cultural status (ESCS), for 15-year-olds, PISA 2009 (Source: OECD 2013: 5)

academic performance between boys and girls are both higher than the OECD average.

It would be useful to list some major factors of policy success and failure, in order to better evaluate policy success and failure in Turkish education system.

## Main Drivers of Failure in Turkish Education Policy

When accepted some deficiencies in Turkish education system and education policy, one needs to identify main drivers of failure. Although it would be possible to extend the list, at least four drivers are worth mentioning. These drivers are listed below, coupling with the related figures.

1. Overcentralization (Fig. 6)
2. Inadequate evaluation of student success (Fig. 7)
3. Inconvenient learning environment (Fig. 8)
4. Inadequate educational attainment (Fig. 9)

Alongside these mega factors, it would be possible to identify other factors of failure and success in Turkish education policy. There is such a (incomplete, worth developing) list (adapted mainly from ETF 2007) of this kind.

## Factors of Failure

- Highly centralized and regulated education system in terms of financial mechanisms but also when it comes to other aspects of the system, including curricula
- Overcentralization (schools have little autonomy and limited capacity to respond to their needs)
- Inadequate public funding (although overall funding has increased in the past decade, data

**Public Policy in Turkey: Success and Failure in Education Reform Policies, Fig. 6** Percentage of decisions taken in public lower secondary schools at each level of government, 2011 (Source: OECD 2013: 16)

**Public Policy in Turkey: Success and Failure in Education Reform Policies, Fig. 7** Percentage of students in schools where the principal reported assessments of students in national modal grade for 15-year-olds, PISA 2009 (Source: OECD 2013: 14)

P

**Public Policy in Turkey: Success and Failure in Education Reform Policies, Fig. 8** The learning environment, PISA 2009 (Source: OECD 2013: 12)

**Public Policy in Turkey: Success and Failure in Education Reform Policies, Fig. 9** Percentage of 15–29-year-olds in education and not in education, by educational attainment and work status, 2011 (Source: OECD 2013: 10)

suggests that primary and secondary education are underfunded compared to other OECD countries)

- Weak intra- and inter-sectoral communication, with policy signals and decisions failing to reach lower echelons or to reach them in a timely manner
- Limited responsiveness to labor market dynamics and needs
- A need to improve capacities for policy analysis and to address the disparities between declaration of intentions, actual implementation, and appropriate institutional settings and capacities
- Difficulties in building vertical and horizontal partnerships with stakeholders, with weak social partner funding and co-funding of education initiatives
- A lack of reliable and up-to-date information about the skills needed by the country, including society and economy
- Much donor–/government-driven innovation within pilot schools, raising questions of sustainability, ability to go to scale, and emergent inequalities between pilot and non-pilot schools
- A tendency for school principals, especially in non-pilot schools, to reproduce the top-down,

authoritarian, bureaucratic nature of the national system, with few schools having strong, tightly knit organizational cultures based on collaboration and with few principals specifically trained as educational leaders
- A need for heavy investment in educational infrastructure, school buildings, workshops, learning and teaching equipment, and teacher salaries
- Low salaries for staff, leading them to invest spare capacities in after-school employment
- A need for further modernization of curricula, textbooks, and teaching methodologies plus related teacher training and assessment of learning outcomes
- Limited professional development opportunities for staff, which jeopardizes the implementation of pedagogical reforms
- The tendency of the Ministry of National Education to change secondary regulations governing schools and student management too frequently, in that students and teachers face a number of uncertainties in their school life (the ministry needs to provide a more stable education environment which enables students and teachers to make plans about their career)
- Still continuing dependency to parents for funding (although majority of schools are publicly funded, schools tend to receive contributions from parents through their school-parent associations)
- Fast social changes (schools and their learning environments face many challenges, including a population influx from rural to urban areas and new Y/Z generation of students)
- Limited capacity of school leaders and teachers to respond to school needs because of weak initial education and training and teachers' lack of experience, as well as the lack of flexibility accorded to schools within the governance structure

### Factors of Success

- Increasing interest in deconcentration of power to provincial levels and in the devolution of an increasing number of responsibilities to the school level
- Increasing efforts to minimize the presence of an extensive and unregulated informal labor market (private tutoring institutions) that employs workers without formal skill certification, thus weakening education reform efforts
- Efforts to decrease inequity in education system through upgrading the school levels (recently, private tutoring institutions were closed down and many of these schools were transformed into private schools)
- Initiatives to make most of information technology in class through such projects as FATIH
- Increasing investments in educational infrastructure, including construction of new buildings, classes, and other education facilities

## Conclusions

Education has always been one of the most vital public policies in Turkey. The proportion of the population in school age is one of the highest among OECD countries. Turkish policy-makers need to keep in mind the fact that it is very important to ensure that these young people complete their education and are well prepared for the labor force and further learning, in order to persist relatively higher growth rates and socioeconomic development. Although some improvements have been made in some aspects of the field of education, both quality and equity still remain a challenge. "Turkey has various priorities to address, including improving equity between regions and urban and rural areas; addressing the needs of disadvantaged students; preparing quality teachers and school leaders; improving access to and completion of upper secondary education, vocational education and training, and higher education; strengthening links to the labor market; and adequately funding the education system" (OECD 2013).

In other words, "Turkish education is a work in progress. During the past 15 years, Turkey has made sizable and noteworthy advances in increasing educational access, but more remains to be done. Turkey must accept the challenge of creating a high-quality education system which

generates more graduates with higher skills – regardless of their family backgrounds – to succeed in an increasingly complex, competitive, and global labor market. Its teachers must be as effective as those in other OECD countries in raising every student's learning even those from disadvantaged circumstances" (Owings et al. 2012).

Some other conclusions are as follows:

- Traditional education policies have been failed in Turkey, and ongoing education reforms need time to deliver its fruits.
- Although Turkey has an enormous success in sustaining a higher growth rate, improving health sector, building new highways and railroads, supporting R&D activities of scientific institutions, and transforming the urban areas, it could not offer a similar performance in the field of education.
- As education is among the most vital issues the country has to encounter, policy-makers need to develop innovative policies and measures.
- Highly centralized education system and school governance are a major factor for the policy failure in Turkey.

## Appendices: Some Figures About Turkish Education

See Table 5.

**Public Policy in Turkey: Success and Failure in Education Reform Policies, Table 5** Six dimensions of Turkish education system

| # | List of key indicators | Turkey | Average or total | Min | Max |
|---|---|---|---|---|---|
| **Background information** | | | | | |
| *Political context* | | | | | |
| 1 | Public expenditure on education as a percentage of GDP, 2010 (EAG 2013) | m | 5.8% | 3.8% | 8.8% |
| *Economy* | | | | | |
| 2 | GDP per capita, 2010, in equivalent USD converted using PPPs (EAG 2013) | 15,775 | | 15,195 | 84,672 |
| 3 | GDP growth 2011 (OECD National Accounts) | 8.5% | 1.8% | −7.1% | 8.5% |
| *Society* | | | | | |
| 4 | Population density, inhab/km$^2$, 2010 (OECD Statistics) | 94.3 | 138 | 2.9 | 492 |
| 5 | Young people, aged less than 15, 2010 (OECD Statistics) | 25.8% | 17.3% | 13% | 28.1% |
| 6 | Foreign-born population, 2009 (OECD Statistics) | m | 14.1% | 0.8% | 36.9% |
| **Education outcomes** | | | | | |
| 7 | Mean reading performance (PISA 2009) | 464 | 493 | 425 | 539 |
| 8 | Change in mean reading performance, 2000–2009 (PISA 2009) | m | 1 | −31 | 40 |
| 9 | Change in mean mathematics performance, 2003–2009 (PISA 2009) | 22 | 0 | −24 | 33 |
| 10 | Change in mean science performance, 2006–2009 (PISA 2009) | 30 | 3 | −12 | 30 |
| 11 | Enrollment rates in early childhood education and primary education, ages 3 and 4, 2011 (EAG 2013) | 11.6% | 74.4% | 11.6% | 98% |
| 12 | Population that has attained below upper secondary education, 25–64 year-olds, 2011 (EAG 2013) | 68% | 25% | 7% | 68% |
| 13 | Population that has attained at least upper secondary education, 25–34 year-olds, 2011 (EAG 2013) | 43% | 82% | 43% | 98% |
| 14 | Population that has attained tertiary education, 25–34 year-olds (EAG 2013) | 19% | 39% | 19% | 64% |
| 15 | Population whose highest level of education is vocational upper secondary or post-secondary non-tertiary, 2011 (EAG 2013) | 8.4% | 33.5% | 8.4% | 73.9% |

# Public Policy-Making in Iran: A Shia Perspective

Mohammad Reza Atarodi
Imam Sadiq University, Tehran, Iran

## Synonyms

Religious policy-making

## Definition

| | |
|---|---|
| Public Policy: | "Anything a government chooses to do or not to do" (Dye 1992: 2). |
| **Public Policy-Making Process:** | The process of identifying one or more specific problems, finding alternatives to solve those problems, and then trying to select and implement one of those alternatives, and finally, assessing whether the implementation of that Policy has solved the problem or not (Lindblom 1968: 4). |

## Introduction

The political process and policy-making of Iran after the 1979 revolution has undergone fundamental changes. The revolution that came to power with the Islamic Republic slogan has been able to overcome the dictatorship of tyrannical kings and involve the people in decision-making and implementation. From the leadership level to members of the town and village councils, all Iranian officials are elected by direct or indirect

P

voting. This entry tries to examine the institutional framework of public policy-making in Iran and answer how fitness between public policy and the Shia rules occurs in the government of the Islamic Republic of Iran?

## Public Policy Actors

Public policy actors in Iran classify into legal and informal sections. Legal actors play a direct role in public policy-making, and their decisions shape public policies. Among the many actors, the leadership, the President, the Parliament, the supreme councils, the Guardian Council of the Constitution, and the Expediency Discernment Council have the most influence on the public policy-making process. Nevertheless, alongside these actors, informal actors, the most important of whom are the clergy, political leaders, and academic elites, influence policies.

## Supreme Leader

The leader is at the top of Iran's power structure. After the 1997 revolution, Iran's political system changed from a dictatorship to an Islamic theocracy. In the new model, the leader plays a crucial role in maintaining the rules of Islamic governance. The Constitution defines attributes for the leader, and the Assembly of Experts selects the leader based on those attributes. The Supreme Leader must try to ensure that the government does not deviate from its primary Islamic duties (Iranian Constitution, Introduction).

## President

The President is the second most powerful person in Iran after the leadership. He has many powers and, in addition to chairing the Cabinet, is also responsible for enforcing the Constitution. The President is elected by direct popular vote for a 4-year term. His consecutive election is possible only once.

## Cabinet

The Cabinet is formed under the chairmanship of the President. This Cabinet is the highest executive decision-making body in the country. At least 33 people, including 18 ministers, 12 vice presidents, the Cabinet secretary, the head of the Radio and Television, and the governor of the central bank, are the Cabinet members. Still, only the President and ministers have the right to vote and approve cabinet decisions.

## Parliament

The Iranian Parliament has excellent power in legislating and overseeing the government and the President. Members of Parliament are elected every 4 years by direct popular vote. Guardian Council of the Constitution must approve Candidates. The Parliament has 290 representatives. Deputies can legislate in all areas. If the Parliamentary approvals have no contradictions with the Shari'a, the Constitution's principles, and the leadership's macro-policies, they become law (Constitution of the Islamic Republic of Iran, Articles 62–65). The Parliament has a research center to provide expert opinions to representatives, commissions, and the board.

### Guardian Council of the Constitution

As Hans (1970) states, the most important guarantor of the Constitution's survival is creating an institutional mechanism to review the approvals of legislative authorities and confirm their compliance with the Constitution (Gorji and Ali 2019: 158). The Guardian Council of the Constitution has this responsibility in Iran. This council is modeled on the French Constitutional Council but differs significantly in membership, powers, and procedures. (Ibid: 154) Besides, the Constitution has defined other essential functions for this council (Karami 2015: 2): Interpretation of the Constitution (Nikonhad et al. 2017: 24), monitoring the presidential election And Parliament (Hashemi 2004: 180) and the compliance of parliamentary approvals with Shari'a and the principles of the Constitution (Karami 2015: 3).

### Expediency Discernment Council

As Hans (1970) states, the most important guarantor of the Constitution's survival is creating an institutional mechanism to review the approvals of legislative authorities and confirm their compliance with the Constitution (Gorji and Ali 2019: 158). The Expediency Council is an advisory body for leadership, especially in setting macro-policies (Faghihi 2015: 107). Another critical mission is to resolve the conflict between the Parliament and the Guardian Council (Article 112 of the Constitution). When the Guardian Council does not confirm the Parliament's approvals, the Parliament must resolve the Guardian Council's objections. If the Parliament is unwilling to amend its resolution, the final decision on that approval is with the Expediency Council (Rahmani 2012: 171).

## Political Parties

In Iran, political parties have not been able to function well. These parties do not have much influence in the policy-making process. Simultaneously, their leaders, who are usually agents and political officials, have influenced the decision-making process due to their power and personal connections.

## Public Policy Formation in Iran

Issues are on policy-makers' agenda whose priority is emphasized by the people, the media, the research results, or agents' insistence. In some cases, the tasks and requirements of previous policies or the results of the implementation of other policies cause the feeling of need for a new policy to be considered. Ordering in Parliament can be received in three ways:

1. **Legal bill**: It is sent to the Parliament for approval by the executive branch.
2. **Judicial bill**: The judiciary prepares this bill intending to approve the law on judicial affairs. Judicial bills must also be submitted to Parliament for approval after being approved by the Cabinet (Najafi and Mohseni 2005: 179–180).
3. **Proposal**: If at least 15 members of Parliament submit a proposal to the Presidium for approval in Parliament, that proposal will consider in the same way as the bills in the public policy-making process.

All bills and proposals will be sent to specialized parliamentary commissions for review. If the members receive a favorable vote in the specialized commission, they will be presented in the central court of the Parliament.

Parliamentary resolutions are sent to the Guardian Council to comply with the Constitution and Shari'a. If the Parliament's approval does not abide by the Constitution or the Shari'a, it will return to the Parliament for amendment. Members of Parliament can amend the approval based on the Guardian Council's opinion and then send it to the Guardian Council for reconsideration. However, if the Parliament members do not accept the Guardian Council's amendments, the members of the Expediency Discernment Council's final opinion will be considered law.

## Public Policy in Iran: How Are Policies Aligned with Shia Perspective?

The history of the adaptation of national policies to the Shari'a dates back to the Constitutional Revolution (1906). Article 2 of the constitutional amendment states that at least five jurists must be parliament members to reject a resolution that is against the Shari'a. However, this Constitution's article was never implemented in practice (Kia and Mohammad 2010: 188). After the 1979 revolution, two mechanisms were envisaged in the Constitution to bring policies in line with Shari'a. In the first mechanism, to keep the government's orientations in Sharia's same direction, the leadership institution was predicted at the top of the pyramid of power. The characteristics set by the Constitution for the leader are such that a person familiar with Shari'a's principles oversees all stages of policy-making. Since determining the macro-policies and

supervising the proper implementation of that policies is one of the leadership duties (Constitution, Article 110), the leadership must accept all approvals of the country's Supreme Councils.

The election of the leader is the responsibility of the Assembly of Experts. These experts are elected by direct popular vote for a term of 8 years. The second mechanism was the establishment of the Guardian Council of the Constitution. According to the Constitution, the Guardian Council must confirm that parliamentary resolutions comply with the Constitution and Shari'a (Solati 2013: 40–65).

## Conclusion

After the 1979 revolution, the Iranians decided to adapt their policy-making process to the rules of Shari'a. Iran's Constitution is based on Shia jurisprudence, but the revolutionaries devised mechanisms to ensure that the policy process was in line with Islamic law content. The two main mechanisms for achieving this goal are establishing an institution of religious leadership within a modern government framework and establishing the Council of Guardians of the Constitution. According to the Constitution, the supreme leader has to formulate macro-policies to present Sharia's national governance spirit. The Guardian Council of the Constitution also has to prevent the development of policies contrary to Shia rules.

## Synonyms

Government; Procurement; Purchases

## Definitions

**Public procurement** refers to the process of purchasing of goods, services and works by the governments as well as the enterprises which are owned by the state.

## Introduction: What Is Public Procurement?

The term public procurement is self-explanatory by itself, as it is clear from its meaning wherein the

public means government and procurement means buying or purchasing. Hence, public procurement maybe referred as a process or system by which the public organizations procure or purchase products in the form of goods, services, or sometimes the combination of goods and services (Thai 2001). Besides, it accounts and interprets the required goods and services proportion as per the overall demand. Scholars also define it as an activity to assess, buy, and receive products, works, and services. This activity is called public when performed by public organizations or in the name of public organizations or funded by them (Adotévi 2004). The supply function within the private firms is concerned with managing the timely delivery of the products and services via a specific supply chain process which is cost-effective and feasible.

Government and the enterprises owned by state procure a wide series of the goods and services as well as get their work from the private sectors which range from the basic equipments of the computers to the construction of buildings and roads. Public procurement is one of the crucial economic activities of the government which characterize a substantial part of its GDP, thereby resulting in the massive financial drifts, which estimates about 10–15% of the GDP across the globe (OECD 2005). It is acknowledged by OECD (2007) as one of the public activities which is most prone to corruption. Being a major interface among the government and private organizations, it gives to both the actors several prospects of distracting the funds of the government for their personal matters (Beth 2007).

About 40–50% of the several economies of the world are represented by their expenditure to provide services and purchases form the private firms. The states like Singapore spend its 18% of economy, whereas the other emerging economies are likely to spend up to 80% of their economies. Although the public procurement is very important, so far it is one of the ignored and underresearched topics up till now (Walker and Brammer 2009), as compared to the procurement of the private firms despite having the same meaning and concepts in the context of scientific phenomenon. Although both the types have similar rules and regulations in terms of function as they have to procure the products and services, in fact they differ from each other (Knight et al. 2012). The main difference among the public and private procurement is identified as the link between both of them (Thai 2008). In addition, the public procurement performs the task to accomplish the social, ecological, and supplementary benefits in their procurement in order to fulfill the duties of government toward the society (Walker and Brammer 2009).

Though public procurement is believed to be an apparently key role of the government, the huge attention has also been given by the public bodies, policy makers, and professionals of public procurement in order to develop and bring reforms in it. Despite all this, it is less studied area in academic and research perspective. Hence, not a single school from the members of the "National Association of Schools of Public Affairs and Administration" is offering the degree programs in public procurement, although more than 103 institutions including universities and colleges have certificate programs in public procurement besides they also offer courses of public procurement in their bachelor, master, and doctoral programs in business administration and related majors of management sciences (Anonymous 2000).

The domain of public procurement owes a long history which is somewhat written on a table made of red clay found in Syria. It shows the pioneer procurement activities dated between 2400 and 2800 B.C. The details of the procurement illustrate "50 jars of the fragranced oil having weight about 600 in grains" (Coe 1989, p. 87). Additionally, some other historical evidences from 800 B.C. have also been found related to procurement which include the silk trade among China and Greek. Evidences from the USA represent the predated procurement of municipal government than that of the state or central government (Page 1980). To cope with the colonies and disbursements, printing had been one of the services of the state. The governments of that time had no any professional officials of procurement; instead they used to get the required products and

services from the commissioners by paying them the commission for their services and delivery. Later in 1810, Oklahoma became the pioneer state to take the initiative of creating a board committee for procurement required by all of its departments and agencies.

## Main Principles of Public Procurement

There are five main principles which underpin the process of procurement; each one of them is discussed below. Refer to Fig. 1 for better understanding of all the five principles.

### Value for Money (VFM)

It is the most imperative principle of procurement which involves the contemplation of public organizations to contribute for development of their policies, rules, and priorities during the time when they are getting the best payback and results against the expenditure (Bauld and McGuinness 2006). At certain times, the states are at their liberty in order to consider some other measures rather than the lowest cost, for instance, the technical skills, educational qualification of the strategic employees, and prior records of performance in conferring contracts to the suppliers (Qiao and Cummings 2003). These things may cost the governments more but will also give more benefits and improved performance. There are some barriers which cause hindrances in attaining the VFM; these include weak central organizations, politics, customs, norms and traditions, and dearth of programs related to education and training (Palmer and Butt 1985). Overcoming these challenges will be useful in achieving the VFM.

### Ethics

Ethics is also one of the significant principles of public procurement, due to the reason that the professionals of procurement are expected to follow the ethical conduct to a greater extent as compared to other professionals (Atkinson 2003). Some of the professionals are still unaware of this, which may cause serious issues such as breaches in the related code of conduct. Atkinson (2003) mentions that 500,000 professionals of procurement exist in the markets of the USA, but only 10% of them are the members of professional association which conducts trainings in ethics of procurement. The rest of the 90% are unaware of the ethics in procurement and the legal standards which are involved in the process of procurement.

Recently, the developments in developed states like the USA, UK, and others have declared that contributing financially for the funds of party and parliament members has been established and become prevalent practices in the developed as

**Public Procurement, Fig. 1** Principles of public procurement

well as developing states (Rege 2001). Yet, the issue of corruption related to procurement has been more serious for the developing states as compared to the developed ones, as they have taken and are still taking certain measures to control it. A report by World Bank shows that every year the corruption reaches over $ 1 million which accounts nearly 12% of the GDP of countries like Nigeria, Kenya, Venezuela, Bangladesh, India, and Sri Lanka. This huge corruption is caused due to the high poverty rate, and rule of law is enforced so poorly in these countries which makes the public procurement more prone to corruption (Nwabuzor 2005). There is a great need to take serious measure to have control over corruption and minimize it to the lowest. However, some states like Sweden, Switzerland, Austria, Netherlands, and Australia seem to have a very good control over corruption and unlike involvement in it, while Bangladesh is reported as the most corrupt country of the world as compared to others (Tandoor 2004). An effective and efficient benchmark needs to be developed as global solution for the ethical dilemma for international code of ethics in the international market.

### Competition

Majority of the products and services are purchased by means of this competitive tendering. For instance, if the ports authority is in need of procurement of gantry cranes, at first it will advertise with all the technical requirements and give a call for bids from the relevant suppliers. After that they start receiving bids which are handed over to the tender board for evaluating the bids if they fulfill their requirements or not. There is a great competition in all this procedure. The credibility of the suppliers and cost seem to be very important for winning the tenders; after evaluation of all the bids, the tender is awarded to the most competitive and credible supplier. This process of competitive tendering reduces the chances of favoritism, corruption, and fraud. In addition, it encourages and enhances the participation of more suppliers, and that high competition leads to the reduction in cost and improvement in the quality of the products and services (Erridge et al. 1999).

### Transparency

Transparency refers to openness of the system which makes it very important for the process of procurement. It is also an essential aspect to ensure accountability and minimize corruption. Transparency, being the core value of governance, has increased eminence in the OECD states and close association in rising the agenda of the government (Deighton-Smith 2004). Public procurement is an area which is surrounded by the widespread corruption in both the developed and developing states. The corruption not only involves the procurement professionals who make the decisions, but the ministers and political parties are also involved in that. To minimize all these activities, transparency plays an important role and adheres the governments to raise their standards of conduct and rule of law and ensures its openness to scrutiny (Deighton-Smith 2004). It also assures both the domestic and international investors for the fair award of tenders and contracts. Dearth of transparency in all markets and missing of the info about rule of law, principles, and practices act as the barriers and cause hindrances in trade, and foreign suppliers get more affected as compared to the local suppliers (Arrowsmith 2003).

### Accountability

The accountability isn't only applicable to the public sector organizations (Barrett 2000), but it also applies on the private organizations and keeps them accountable to their respective stakeholders for all the financial transactions (Hughes 2003). Employees in public organizations usually face political influence in performing their responsibilities and implementing them, whereas the private sector has to pay attention to mechanism of markets they are working with (Stewart 1999). Both the sectors differ in the context of influence, but the principle of accountability applies to both of them equally. The accountability, being an imperative principle of public procurement, is followed at both the levels (i.e., national as well as international). Internationally, the governments often have involvement in the activities of trading, purchase of products and services, aid matters which include both give and get, and play the

diplomatic roles in other states (Department of Foreign Affairs and Trade 2006). This conduct leads to financial risk and also creates the issues in accountability. While the scenario for the national level is quite different from that of the international, here the managers in public sector organizations have to face the situations which are more competitive than before. They also have to deal with the public which always demands accountability and better services and products (Gunasekaran 2005).

## Policies of Public Procurement: Why Do They Matter?

This part mainly outlines and builds the framework of relevance and application of public procurement in the context of economic, social, and environmental perspective; besides it also discusses the ways of integration of issues regarding the sustainability and innovation into public procurement. This will increase the understanding of the policies of public procurement and their relevance to the sustainability and innovation.

## Impact of Public Procurement: A Broader View Ahead

Generally, public procurement is observed to spend for works, products, and services required. Government has the responsibility to regulate and control the execution of public procurement in accordance with its rule of law and principles. By these, they might also need certain goals and objectives as the secondary ones and account them in the public procurement likewise the European Union. These rules of law and principles are applicable on a broader level as compared to the direct government spending unaccompanied.

The expenditure of the government is huge and noteworthy. The estimated expenditure on public procurement in Europe is about €2 trillion every year (European Commission 2011; Procurement of Innovation Platform 2014). In general, it is about 15–20% of GDP, whereas 40–90% of budget of the public is consumed on the purchase of products, services, and other works (European Commission 2016). Consequently, these absolute budgets enable governments to use the power of their markets to get the economic, social, as well as environmental results and upshots directly; besides it also arouses the marketplace to yield and consume in a sustainable and innovative manner (ICLEI and Clement 2007).

Thus, the policies of public procurement which boost up the governments to get involved in stability and innovation are becoming more crucial in addressing technical advancements and challenges in socioeconomic perspective (Lember et al. 2013; Rolfstam 2013). The primary goal of the public procurement is to accomplish value for money in the perspective of cost and quality, while the impact to supplementary goals of the policies is recognized as the secondary goal of the public procurement policies.

## Sustainable and Innovative Public Procurement Policies

These polices have been in practice national and local levels; besides numerous organizations are also executing these policies to engage themselves toward attaining sustainability and innovation. This operationalization probably brings in benefits and paybacks to the national governments in several ways around. At first, it brings in the financial paybacks. A report by the UK's Office of Government Commerce (2011) confirmed that in execution of these policies in public procurement, the value of money can easily achieved by the optimal combination of prices of life cycle and quality so as to cope with the needs of the public. Additionally, the effectiveness of cost can also be brought in by implementing the sustainable policies, specifically when the cost of whole life is being accounted for (United Nations and Kjöllerström 2008; European Commission 2011).

Furthermore, execution of the sustainable and innovative policies has also been contributing in terms of accomplishment of the environmental as well as social goals and objectives (Sustainable

Procurement Task Force 2006; European Parliament et al. 2010). The governments get huge support in attaining their goals and objectives in terms of transnational agreements, for instance, the Paris Agreement in 2015, and refining their image in the eyes of public or common people (Procurement of Innovation Platform 2014). Overall, these paybacks and contributions of the sustainable and innovative policies of public procurement help to trigger and initiate the governments to govern as specimen and example for other states to follow.

## Barriers to Implement the Sustainable and Innovative Policies of Public Procurement

There are some barriers which restrict the policies of public procurement to be implemented effectively; first, aversion of risk, dearth of skills and competence, as well as inadequate resources (UNEP 2013). Secondly, there occurs hindrance in implementation of the public procurement policies due to the reason that they are usually reflected as a responsibility related to economic and administrative side. Therefore, these policies are not aligned with a broader functioning to accomplish the desired goals and objectives (Procurement of Innovation Platform 2014). In addition, the national governments perceive the implementation of these policies to be expensive for them (European Commission 2015). Thirdly, deficiency of the political obligation and assurance along with the technical capability of the governments to effective application of such policies may also act as a barrier (United Nations and Kjöllerström 2008).

## Implementing Public Procurement Policies

Regardless of these barriers which cause hindrances in the implementation of these policies, the governments are actively taking part for the proper and effective application of such policies by several means varying from the legal chucks to soft recommendations for practice so as to implement effectively and efficiently. For instance, it has been very important to consider other perspectives along with the price in contract awarding criteria in European Union, which make the purchasing agencies to identify other measures including quality used (European Directives 2014). Additionally, some legal procedures may also sometimes be useful to maintain sustainability at certain level. It is clearer and understandable to assume that enactment of policy objectives and goals in different perspectives via public procurement in different ways in order to define the policy goals have variations in the outcomes, as the situations may also vary depending upon the countries (Knight et al. 2004). Hence, the countries learn from the implementing styles of other countries and their consequences, which may be a lesson for them.

## Forms of Public Procurement

Public procurement that assumes innovation as its strategy in the policies of innovation is probable to appear in diverse forms which can be differentiated in a comparative mode. There are three main forms of public procurement in this perspective which are discussed as follows.

### General Versus Strategic Procurement

Procurement within the states can be distinguished in two main levels. The first level is usually structured in such a form to make the innovation as basic criterion in each of their tender call and evaluation of its documents at a later stage. Currently, it is often practiced in the UK and rarely in other states. This makes the central offices solely responsible for procurement and its consequences. These are under the control of ministry of interior and finance rather than the ministry dealing with innovation policies. The second level is the strategic procurement which takes place in the situations when the need of technology, goods, and services rises so as to boost up the market. Being related to sectorial policy, it's not interfered or in coordination with the ministry dealing with the innovation.

The systematic application of both these forms of public procurement requires actions and

functionalities in coordination among the several ministries and establishments dealing with public procurement along with their set targets, goals, and the structure of incentives offered in return.

### State Procurement in Connection with Private Users

Some strategies in procurement process don't only exist to meet the needs and accomplish the operationalization of the countries, they are also meant to provide support and livelihood to the private sellers and contractors (Rothwell 1984). This process leads to the occurrence of cooperative procurement in which both agencies, government and private buyers, procure and use the innovations jointly. Hence, they take the joint benefit from the innovations procured from either side, which saves the money of both agencies, and cause a mutual benefit for government agencies as well as private purchasers. In addition, it increases the availability of recent innovations which are useful for both of them.

### Commercial Versus Pre-commercial Procurement

The yearning and aspiration to practice procurement to bring innovation has always led the states to take new and innovative initiative to cope with this modern era of globalization, particularly in European countries, who have been leading in more differentiating the approaches of public procurement. The main idea behind this form of public procurement points out the innovative goods and services which require further research and development (R&D). Hence, the high-tech risk which may occur in R&D is mutually shared by the buyers and suppliers. Theoretically, it gives the idea about the current position of potential manufacturers endeavoring to go ahead of the pre-commercial phase, which means that the goods and services being provided are not available in stock but they are produced on demand base. But practically, the word procurement refers to the R&D amenity agreement that is made with the future suppliers in a process of multiple phases, ranging from assessment and viability to R&D, tests of the first consignments in the field leading to their commercialization.

## Concept and Goals of Public Procurement

Public procurement has been acknowledged as the central and fundamental mechanism to assure the public resources management as proficient and free of corruption. To do so, recently the concerned officials have intensely changed and played a significant part to meet the demands of the current times. The earlier governments of law and order and public security along with the major projects in civil, employers, buyers, and sometimes the suppliers also procure the products and services and have stated the public procurement as an ideal system (UNOPS 2011). According to Lloyd and McCue (2004), all of the deals of the government comprise of the purchasing of products and services from the commencement of the process and pinpoint the needs of implication of the contract. Narrowly speaking, public procurement is all about awarding the contract to an appropriate and potential supplier who can accomplish it efficiently and effectively, while in a broader sense, it consists of all the administrative practices ranging from decision of awarding and terminating of the contracts (Arrowsmith 2005). Arrowsmith et al. (2010) have categorized eight main objectives of the public procurement differing in significance on the basis of the system:

- Efficiency – effectiveness in getting necessary goods, works, and services
- Integrity – away from corruption and clashes
- Effectively executing the objectives related to industries, social, as well as environment in the perspective of procurement
- Internationalization of the public markets
- Making the process of public procurement more efficient and effective
- Providing equal opportunities
- Fair dealing for the suppliers
- Rational conduct of providers

## Conclusion

Public procurement is a means to accomplish the policy goals of the government and procure good, services, and works in an efficient and

cost-effective way. Despite some barriers, there are certain principles of the public procurement which make it easier to follow without any hindrance and bias. The policies of public procurement are being well implemented in developed states, while the developing states are still endeavoring to implement properly.

# Public Procurement and Accountability

Christopher L. Atkinson
University of West Florida, Pensacola, FL, USA

## Synonyms

Legitimacy of public procurement projects; Transparency

## Definition

An accountable public procurement function "encompasses the idea of conducting public procurement in a manner that can be traced and defended, is transparent and consistent, satisfies and manages stakeholders' expectations, is fair and equitable, and follows ethical norms set within organizational and societal contexts in order to maximize the benefit obtained from spending public funds" (Diggs and Roman 2012, p. 298).

## Introduction

As a matter of legitimacy in the public sector enterprise (Atkinson 2017b), the accountability and transparency of administrative processes has been essential. This is especially apparent in the case of public procurement, which features aspects that are essentially business-like and market-based, while at the same time requiring consistency and fairness, competitiveness, and attention to socioeconomic programs, as well as checks on power and authority, in a manner that is more representative of government priorities. As public procurement is asked to serve more purposes beyond acquiring products and services at best cost, the role of public procurement becomes pronounced and prominent, moving well beyond a simple back-office government support function.

The public procurement function exists as an especially public interface with interests beyond the walls of government. Because government procurement outlays in contracts and purchases are great expenditures of taxpayer resources, public procurement is often seen as a locus of fraud and corruption (Rustiarini et al. 2019). Whether this fraud is real or perceived, the existence of instances of corruption in public expenditure are ongoing examples of critical failure and abuse of the public trust. The function is precariously placed as a power center, a protector of the public interest – even acting in a proxy role of the taxpayer in demanding the best possible deal, and an indispensable resource for the function of government agencies.

In times when the legitimacy of the public sector is regularly challenged, the role of public procurement in both instrumental and symbolic terms may tend to take on heightened importance. An accountable public purchasing function may be emblematic of government deserving of public trust. However, the complexity of public procurement processes, systems, and authorities may challenge and confuse the public, in ways that undermine the attainability of a popular sense of public procurement as accountable, even if the system works as intended most of the time.

This entry provides an overview of accountability in public procurement. Accountability is seen as a multifaceted matter given a variety of stakeholders and interests, and considerable differences in what makes a public procurement function successful. A discussion of the challenges facing accountability in public-sector purchasing concludes the entry.

## Accountability in Public Procurement

Diggs and Roman (2012) suggest that for "public procurement specialists, accountability encompasses the idea of conducting public procurement in a manner that can be traced and defended, is transparent and consistent, satisfies and manages stakeholders' expectations, is fair and equitable, and follows ethical norms set within organizational and societal contexts in order to maximize the benefit obtained from spending public funds" (p. 298).

Bappaditya Mukhopadhyay wrote that "good procurement establishes and then maintains rules and procedures that are accessible and unambiguous. It is not only fair, but should be 'seen' to be fair" (2011, pp. 49–50). Transparency is closely associated with accountability. Circumvention of rules, arbitrary implementation, manipulation of processes, lack of penalty for misconduct, and inconsistent enforcement, individually and collectively illustrating abuse of power, make accountability less likely (Broms et al. 2019).

Sumanjeet wrote that "Institutional transparency is the basis of good economic governance and the first step in improving accountability and fighting corruption" (2015, p. 189). Mabillard and Zumofen instead suggested that accountability is bidirectional with transparency, with accountability shining a light on injustice and calling penalty for abuses; both concepts are intrinsically valued and praised by governments (2020). Regardless, the regulatory apparatus of government provides for enforcement of rules and consequences for violations, thus allowing for connection of public processes like procurement to larger considerations and ideals, such as equality of opportunity (Wright and Conley 2018). Both transparency and accountability are watch-words of government and frequent refrains, especially in times of trouble.

## Stakeholders and Interests

Public procurement professionals must be transparent and accountable, answerable to the public through processes, checks and balances, and the inquiries of elected officials (Roman 2017), administrative superiors, and the courts, while also acting in a business function that requires understanding of market processes and ability to negotiate shrewdly to make the best deal possible for the public dollar. Balancing the two hemispheres of thinking on the responsibility of procurement is important and yet, perhaps seldom fully attained. Agency clients and stakeholders want projects done as quickly as possible, but procurement professionals know that short timelines and other deviations to prescribed processes can interfere with competitive processes and possibly even invite corruption (Rustiarini et al. 2019).

The symbolic achievement of accountability may be presented to the public as specific reforms to administrative processes, intended to adjust both immediate and long-term outcomes. Procurement has been seen as an answer for addressing needs for societal change, including sustainability; however, prioritization of sustainability in practice may be more associated with larger projects (Vluggen et al. 2019), rather than day-to-day activities for smaller projects, which have considerable cumulative impact. Public procurement has also been called upon to address extremely complicated problems like disparity in award of public contracts (Atkinson 2017a), or economic growth through awards made to small businesses (Loader 2018). However, despite the passage of laws and initiatives, it may be difficult to discern their success or failure given performance measurement concerns and lack of meaningful targets (Loader 2018).

## Challenges for Accountability in Public Procurement

The cause of fair and accountable public procurement may be weakened by inconsistency in processes between agencies (Erridge 2000); standards can assist with a baseline of assurance for approachability in process and fairness in evaluation, but without consistent implementation, the potential for success is reduced. While there is great potential in legislation that adjusts expectations to consider larger issues, there may be a lack of enforcement of these provisions; this can undermine achievement of performance expectations (Vluggen et al. 2019). Centralization may be a way forward for consistency, but this may challenge accountability at the level of local government (Gori et al. 2017).

Accountability is further threatened by "ad hoc modifications of public procurement laws" (Ayhan and Ustuner 2015, p. 640). When procurement processes are reformed, the seeds of the failure of reforms are carried in the exceptions allowed for within processes, and a lack of political will to support and maintain positive changes. Procurement accountability is important and a priority, but perhaps not the greatest priority in practice. Still, attention paid to accountability is critical, if procurement is to be open to the broadest possible range of vendors, to assure the best deal for the government client. This rings true even if the task is trying (Ayhan and Ustuner 2015).

Even as public procurement is widely seen as a professional, skilled area, with a need for position incumbents to be trained and experienced (see for example Zhuang 2020, in context of participatory social accountability in China), the talent and proficiency of procurement professionals has been called into question (Erridge 2000); the call for increased professionalism in the procurement function continues mantra-like, even though the complex problems of public procurement and how it moves forward into the future likely demand more complex, nuanced answers. Officials who work in procurement are often subjected to great, even unfair, scrutiny, as the vast opportunities associated with government contract awards bring out more competitive, and base, market instincts. The processes of government are portrayed as slow and wasteful, even though those same processes were instituted with the notion of providing for accountability, transparency, and increased opportunity (Baldus and Hatton 2020).

Procurement is a challenging function for prospects of accountability because some governments do not provide for a market-based, competitive, open, and transparent process; without transparency, accountability is difficult to attain. Benchmarking and compliance processes may help improve prospects for fairness (Kajimbwa 2018). It is at least possible that improved, transparent systems can better disseminate information on procurement processes and outcomes, but it has been suggested that the evidence for this is not abundant (Knack et al. 2019). However, technocratic, instrumental approaches to solving problems of human nature are often insufficient, though they may satisfy short-term political needs.

## Conclusion

Public procurement is a critical aspect of public sector function. The potential for wider failure beyond the function emphasizes the importance of transparency and how deviations from process may reduce positive outcomes that may otherwise have been achieved. The literature suggests value in prioritization of accountability in public procurement, but also finds considerable concern with how accountability is defined and achieved in practical terms.

# Public Procurement and Knowledge Sharing

Cluny Mendez
The University of West Florida, Pensacola, USA

## Synonyms

Information sharing; Public tender; Green purchasing

## Definition

Public procurement and knowledge sharing refers to activities centered around the exchange of information and ideas between individuals concerning public organizations' purchasing of goods and services through formal and informal devices.

## Introduction

Advancing the efficiency of public procurement can be achieved through knowledge sharing. The diversity of public procurement methods means that knowledge sharing between stakeholders can significantly increase the stakeholders' understanding of the different methods as well as the benefits and disadvantages of each. As a result, stakeholders can make more informed decisions when choosing the appropriate channels to purchase goods and services that address the needs of society.

This entry first explores public procurement and knowledge sharing as separate entities and then provides details of how knowledge sharing can help advance the understanding of public procurement. The fast-paced, ever-changing nature of public procurement practices requires all stakeholders to engage in continuous learning of cutting-edge practices diligently. Knowledge sharing, both formally and informally, can be one of the most effective and efficient ways for this to occur.

## Public Procurement

Public procurement (PP) is a public authority's purchase of services and goods that benefit the society the authority is tasked with overseeing (Sparrevik et al. 2018). Public procurement often cycles through the three phases of pre-tender, tender, and post tender (Holma et al. 2019). The process of the procurement of these services and goods is dictated by formal regulations that monitor the relationship between the buyer and the seller (Sparrevik et al. 2018). The legislation associated with public procurement is deliberate to thwart corruption, waste, and local protectionism (Sparrevik et al. 2018). Furthermore, it helps to institute a free market grounded in the theory of competitive advantage (Preda 2019). Public procurement uniquely addresses the needs and demands of society.

A public organization or government has a duty to purchase goods and services through a fair process that is fiscally responsible (Adil et al. 2014). Public procurement practices vary significantly between simple and complex as well as between formal and informal. However, regardless of the complexity or formality of the practice, public organizations must follow a set of guidelines designed to help organizations maintain the integrity of their purchasing practices (Sparrevik et al. 2018). These guidelines may be anywhere between very similar and vastly different, but, ultimately, they must meet the fiscal and ethical demands of the public organization. Public organizations and governments differ greatly in size and responsibility, as well, although this may not dictate the similarities or differences in public procurement practices. For example, a very small local government may use similar guidelines as a very large public organization. As long as the guidelines meet the demands of the individual organization, they are deemed appropriate.

## Knowledge Sharing

"Knowledge sharing is an activity through which knowledge, namely, information, skills, or expertise, is exchanged between people, friends, families, communities or organizations" (Charband and Navimipour 2016, p. 1131). Knowledge sharing promotes growth and understanding of a topic for both the person or people sharing the knowledge and the recipients. The people who are sharing knowledge are allowed to articulate what they know, which is a vital educational tool for ensuring understanding. When a person can effectively communicate the nuances of any topic with precision, it means that he or she truly understands that topic. On the other hand, the recipients of the knowledge sharing may be learning of the information for the first time or may have very little knowledge of the topic. By receiving the information through operational knowledge sharing activities, they can gain a better understanding of the topic and consider how they can apply their new knowledge to their particular situation (Al-Kurdi et al. 2020). If both the person sharing and the recipient understand the topic, then they can engage in mutual knowledge sharing activities. In these activities, both sides exchange knowledge where they continuously change roles between being the person sharing and the recipient. In these situations, both sides gain new insights and emerge from the activities with a broader understanding of the topic.

Knowledge sharing can empower organizations by creating a collaborative environment that promotes the transference of knowledge (Charband and Navimipour 2016). Establishing that the stakeholders of an organization are credible knowledge holders is vital to the success of knowledge sharing (Al-Kurdi et al. 2020; Charband and Navimipour 2016). At the onset of any knowledge sharing endeavors, stakeholders should seek to convey their credibility, which will then serve as a basis upon which to build a relationship grounded in respect and transparency. As stakeholders share knowledge via positive and active channels, organizations can expect to see an increase in the creativity and productivity of their stakeholders (Charband and Navimipour 2016). Furthermore, they may experience their stakeholders engaging in higher-quality communication that uses more diversified techniques (Charband and Navimipour 2016). Stakeholders should understand their roles in

knowledge sharing and experience self-efficacy and a sense of satisfaction in themselves, which will serve as motivation to continue to engage in knowledge sharing (Charband and Navimipour 2016). Organizations and stakeholders alike should be cautious not to create a competitive atmosphere as this may significantly stunt the development of the positive outcomes associated with knowledge sharing (Charband and Navimipour 2016).

Knowledge sharing is a form of education. Therefore, individuals participating in knowledge sharing may consider using basic pedagogical practices. One pedagogical practice that individuals may consider is to embark on the activities with enthusiasm to help create a positive learning environment. Additionally, the positive attitudes of the individuals help create an energy where all stakeholders can embrace a positive attitude, which significantly improves the learning process. The foundations of pedagogy are tethered to discussions, reflections, and feedback, all of which are vital to successful knowledge sharing. By consciously activating each of these pedagogical pillars with meaningful activities, stakeholders can increase the quality of knowledge sharing, resulting in stakeholders understanding the topics of interest with more depth and breadth.

## Knowledge Sharing and Public Procurement

Meeting the societal demands at any level of public administration and government is more demanding than ever (Wesseling and Edquist 2018). Therefore, public organizations and officials should engage in activities that promote their understanding of the most effective and efficient ways to meet the demands. When it comes to public policies, which include public procurement, the collaboration between all stakeholders can be key factors in formulating and executing effective and efficient policies (Cravero 2019). Knowledge sharing offers a unique platform for operative collaboration. Under conditions of transparency, respect, and trustworthiness, pubic administrators and other officials can share their knowledge of public procurement. Open dialog between all stakeholders can advance each stakeholder's understanding of best practices. The understanding of best practices can then function as a springboard as each stakeholder considers how his or her new knowledge fits with the old knowledge. After this, a more in-depth analysis of public procurement practices is possible. Consideration of how current practices may be revised based on the new knowledge and findings of the analysis could result in more effective and efficient practices concerning public procurement practices. Ultimately, society's demands and needs are met with greater practicality.

While knowledge sharing in public procurement can significantly advance stakeholders' understanding in this area, it is important to consider the challenges associated with the activity as well. Stakeholders at all levels of public organizations and governments must do all they can to overcome these challenges and not allow any adverse effects of the process discount the positive ones. One challenge stakeholders must look to overcome is that certain forms of collaboration and knowledge sharing may not fit within the formal regulations of a particular public procurement entity (Holma et al. 2019). Before the onset of any knowledge sharing activity, stakeholders must ensure that the activity will not infringe on the boundaries set forth by the regulations and guidelines. If such a boundary is crossed, stakeholders must immediately suspend the collaboration or knowledge sharing activity and seek alternate avenues for collaboration. Another challenge that stakeholders must be aware of is that co-developing and collaborating are activities that can spark competition within the group as different individuals may have different perspectives and beliefs. The sometimes-subjective nature of public procurement can fuel debates concerning competing perspectives and beliefs, which can create a negative environment and adversely affect the goals of knowledge sharing (Popović et al. 2015). To mitigate conflicts that may arise, stakeholders must come to knowledge sharing activities with open minds and a willingness to consider beliefs different from their own. Additionally, organizations and governments can help

overcome this challenge by creating a culture that embraces a diversity of ideas and celebrates different views rather than discouraging them.

Public organizations and governments may be putting themselves in severely compromising positions by not participating in knowledge sharing activities. A lack of internal knowledge sharing activities and a lack of knowledge sharing with outside parties can lead to organizations and governments using antiquated public procurement models. Furthermore, a lack of participation in knowledge sharing may lead to stagnancy in the growth process, which is virtually always detrimental to an organization. Therefore, public organizations and governments should actively seek various avenues for organizational growth, including knowledge sharing.

Stakeholders should look to be creative and open-minded when approaching knowledge sharing in public procurement. As long as the collaboration fit within the guidelines, stakeholders should explore whatever avenues of knowledge sharing feel most comfortable and most appropriate for their organization or government. Although there may be times of discomfort, stakeholders should remain committed to the process and persevere through it. Open lines of communication and transparency can help organizations and governments create cultures that nurture and cultivate collaboration and knowledge sharing so that continual growth and improvements are present.

## Recommendation for Future Research

While this entry provides a broad view of public procurement and knowledge sharing, future research may look to explore specific knowledge sharing activities. Furthermore, an exploration into which knowledge sharing activities stakeholders find most useful could be valuable contributions to literature. One such knowledge sharing platform for stakeholders in the public procurement arena that may be further considered is that of online knowledge sharing. Online knowledge sharing may be the best platform for stakeholders because it may harness the disorganization and informality of many public procurement knowledge sharing endeavors. Furthermore, it may allow for more collaboration as this platform can reach anyone around the globe. These are just two avenues of potential research concerning online knowledge sharing in public procurement, although there is certainly a multitude of other avenues available.

If a more general arena for future research is desired, the author recommends exploring different models of public procurement and how those different models may affect knowledge sharing practices. In addition to details of the different models, researchers may want to consider how the different models may be applied across different types of organizations. Further research may consider the similarities and differences in applying one model to different organizations. In either case, the researcher may want to consider what knowledge sharing may look like in the different organizations and under the different models.

Whether specific or general, the author of this entry hopes that the information here stimulates thoughts and questions in the readers that lead them to embark on future research and further study of public procurement and knowledge sharing.

## Conclusion

The implications associated with public procurement have significant impacts on society fiscally, culturally, and environmentally. Locally and globally, public procurement practices vary considerably with various levels of success. Stakeholders must use the demands placed on their governments or organizations to make decisions about public procurement so that their needs are best met. What works for one organization may or may not work for another organization, even if it is very similar. However, all governments and organizations can learn from each other. Knowledge sharing can provide a platform for this learning to occur. Whether formal or informal, knowledge sharing of successful and unsuccessful practices can give rise to new ideas and public procurement undertakings that a government or

organization may implement. In other cases, it may provide additional dimensions to a public procurement practice that the government or organization already has in place. The additional dimensions may stimulate just a minor change to the practices already implemented but may result in a considerable improvement to the outcomes of the government or organization's public procurement practices.

Public procurement practices can grow and change at a fast pace. Therefore, governments and organizations must be diligent in staying informed with trending practices. Additionally, governments and organizations must engage in constant reflections and internal assessments to ensure their public procurement practices are meeting their needs most effectively and efficiently. Knowledge sharing provides a strong framework for governments and organizations to stay informed as well as self-reflect as it requires discussion and collaboration, both of which promote the growth of understanding. With a commitment to constant improvement, governments and organizations can use the platform of knowledge sharing to grow and advance their public procurement practices to meet the needs of society with persistent proficiency.

# Public Procurement and Performance

Monsiapile Agapto Kajimbwa
Dar es salaam, Tanzania

P

## Introduction

Accountability in public procurement has remained one of the most challenging issues, especially in the developing countries. The capacity of government institutions of accountability in oversight function for managing public resources is weak as most of the countries do not have a public procurement system based on open competition, transparency, and market principles (Hunja 2001). Although the public sector has made substantive procurement reforms in their governments in its public procurement system, public procurement regulatory authorities are still faced with the challenge of monitoring compliance of procuring entities. It seems the regulatory authorities have limited scope and methodological approaches for strengthening procuring entities such as local government authorities'

capacity to measure, compare, learn, and improve performance in public procurement practices. In fact, the authoritative culture is a typical character of most government agencies as they are bureaucratic in nature and extremely reluctant to change their current habit and practice (Raymond 2008).

## The Notion of Public Procurement

The notion of public accountability is one of the concepts that need to be looked at in this case study as from public procurement point of view, it appears to be the beacon for achieving economic, environmental, technological, and social goals of any country. Recently, efforts to strengthen public accountability with expectation will prevent or reveal misuse of nation's financial resources. But what does the term public accountability mean? Public accountability may be viewed from two schools of thoughts. First, according to Bovens (2003, p. 3), the term "public" may refer to "openness i.e. accessible to citizens." The second school of thought may refer to "the public sector, [mainly focusing] on public managers, on officials spending public money, exercising public authority, or managing a corporate body under public law" (Bovens 2003, p. 3). The AGO (2011, p. 5) of Singapore applauds the second notion of public accountability as defined in Bovens and argues that "when a person is given the responsibility to hold, use or dispose off resources not belonging to him, he must be held fully answerable to the owner of the resources for what he does with them. This is the principle of accountability." In this context, the citizens are the owners of the country's financial resources and must comprehend and work in favor of the processes and mechanisms that safeguard public accountability. Public procurement uses nation's financial resources, and it is important that it is accounted for. In what follows is an account of what does public procurement look like before embarking on the magnitude of public procurement.

### What Does Public Procurement Look Like?

Different scholars and organizations have provided more closely related definitions to public procurement. In general, they all agree and concede to the definition advanced by the Environmental Protection Agency (EPA) of the Government of Ireland. The EPA (2017) defines public procurement as "the acquisition, whether under formal contract or not, of works, supplies and services by public bodies. It ranges from the purchase of routine supplies or services to formal tendering and placing contracts for large infrastructural projects." The OECD further confirms the EPA's definition of public procurement that it indeed refers to "the purchase by governments and state-owned enterprises of goods, services and works." Therefore, the definition of public procurement implies for the public authorities, including Local Government Authorities to ensuring the application of fair, competitive, transparent, nondiscriminatory, and value for money procurement standards and practices – set standards for the public procurement systems (URT 2011; Musanzikwa 2013). It also means that the public procurement and regulatory authorities need to monitor and enforce compliance, build procurement capacity of governments procuring entities in collaboration with other professional bodies. But what is the track record of applying benchmarking accountability as an instrument for measuring, comparing, and learning to improve performance in public procurement practices?

#### Learning Based on Performance: Benchmarking Accountability

Despite the efforts taken by countries to reform the way in which public procurement regulatory authorizes in their respective countries, the authorities are still faced with the challenge of monitoring compliance of procuring entities. Seemingly, one of the key challenges is limited scope and methodological approaches for strengthening procuring entities capacity to measure, compare, learn, and improve performance in public procurement practices. Many of the authorities are currently using procurement audit, under the System of Checking and Monitoring Procurement (SCMP), which has not been helpful. According to Mlinga (2016), most of the assessments conducted using the SCMP audit model revealed the poor performance of the procuring

entities in complying with the public procurement Act and the Regulations. The methodological approach of monitoring procuring entities, using the SCMP audit model, is authoritative, instructional, and does not encourage procuring entities, learn based on the performance of peers (ibid.). In fact, "this approach of SCMP is appropriate for identifying clear areas of non-compliance, but it is not a model that provides for collegial performance improvement either for PPRA or the procuring entities" (Stoop et al. 2012). The authoritative culture is a typical character of most government agencies as they are bureaucratic in nature and extremely reluctant to change their current habit and practice (Raymond 2008). Luckily, proponents of public procurement performance have subscribed to the application Benchmarking Accountability as an approach that is likely to enhance performance, compliance, and accountability of procuring entities.

The concept of benchmarking in public procurement is broadly discussed in the literature and provides substantive knowledge on learning based on the performance of peers. For example, Triantaffilau in Raymond (2008) argues that as a practice in the public sector, benchmarking implies a systematic measurement and comparison of the activities of individuals and (peer) organizations with a view to improve their performance. In fact, Jurevicius (2014) points out that this type of benchmarking is referred to as process benchmarking. This type of benchmarking requires to look at other peer organizations that engage in similar activities and to identify the best practices that can be applied to your own processes in order to improve them. Process benchmarking is a separate type of benchmarking, but it usually derives from performance benchmarking. Benchmarking is a strategy tool used to compare the performance of the business processes and products with the best performances of other companies inside and outside the industry (Jurevicius 2014). On the whole, the author concedes to the Business Dictionary definition of benchmarking as an instrument for learning based on performance of procuring entities. The Business Dictionary defines benchmarking as a "measurement of the quality of organization's policies, products, programs, strategies, [procurement practices], etc., and their comparison with standard measurements, or similar measurement of peers." The definition of benchmarking that the has presented is very much endorsed in VNG (2010) International and Raymond (2008), and all agree that the Benchmarking model is the comparison in performance indicators of similar organizations. According to VNG (2010) International, the model consists of four stages. They include: collect, compare, learn, and improve. In the "collect" stage information is collected about the performance of participating local governments on a certain topic based on performance indicators. The "compare" stage identifies the differences between the organizations. In the "learn" stage district councils learn about the practices of district councils that perform well. In the "improve" stage district councils implement the learned practices and improve their performance. Seemingly, the methodological approach of monitoring procuring entities, using benchmarking, is likely to provide public procurement regulatory authorities staff and local government authorities a collegial, participative and self-discovering on what constitutes compliance. Looking at the size of expenditure in public procurement relative to national budget and gross domestic product (GDP) or the scale of government purchases, monitoring compliance may greatly benefit from methodological approaches of benchmarking.

Literature review clearly shows that the track record of benchmarking accountability is of recent development in the public sector and not widely applied in the developing countries, especially in the public procurement subsector. In fact, the World Bank Group (2017, p. 13) admits that "to date, no attempt has been made to collect comparable statistics on the size of public procurement in economies around the world. While data are publicly available for High-income economies, for the rest of the world, data and studies are scarce." Additionally, the OECD (2010) mentions that for the first time in 2004 a Johannesburg Declaration was launched in South Africa to formalize benchmarking in public procurement. The launching constituted a Procurement Round Table Initiative, coined under the sponsorship of

World Bank and OECD Development Assistance Committee (DAC). The Procurement Round Table Initiative was charged with "advancing the development and methodology for application of the baseline indicators and associated compliance and performance indicators" (OECD 2010, p. 2). Arguably, the initiative may be considered as a good starting point for scaling up the model of benchmarking toward accountability through "identify[ing] the strengths and weaknesses of the [public procurement] systems assessed and increase the ability to track progress of reform initiatives" (OECD 2010, p. 2).

It is a foundation for enabling public procurement and regulatory authorities in developing countries to start figuring out the applicability of the model as part of reforming the current approaches of monitoring compliance. Recent development with benchmarking is noted with the World Bank in assessing public procurement regulatory systems. Recognizing the value of benchmarking the World Bank launched benchmarking public procurement in 2013, focusing on legal and regulatory environments that affect the ability of the private sector to do business with government.

To operationalize the model, the World Bank conducted benchmarking public procurement in 2015 and covers ten economies, including two African countries, Ghana and Uganda. In 2016, the World Bank released a report on benchmarking which was conducted in 77 economies, aimed at supporting "evidence-based decision making on procurement policies and reforms by providing comparable data on regulatory environment that affect the ability of private companies to do business with government". The initiative was further expanded in 2017 and covered 180 countries of which 45 economies from Sub-Saharan Africa, including Tanzania (World Bank Group 2017). The objective of the World Bank initiative was to fill in the gap in the absence of comparable data that "enhance global understanding of laws and regulations that affect private suppliers' participation in the public procurement market" (World Bank Group 2017, p. 5). Sadly, despite the good intention of the OECD and the World Bank initiatives, there is no clear evidence as to the application of benchmarking accountability of local government authorities in public procurement where, to a greater extent, the size of expenditure in public procurement is exorbitant. In fact, the World Bank Group (2017, p. 26) informs that in the event benchmarking is conducted in the public procurement sector, "data are mainly collected at the national or federal level. Therefore, the data do not reflect the laws and practice at the local level in other parts of the economy." Implicitly, the tools and methodological approach for benchmark assessment of local level compliance in public procurement practices are not in place. Space for procuring entities to learn based on the performance of peers is constricted. However, the two initiatives open the opportunity for more discussions and research as well as policy arrangement on the applicability of the benchmarking model and decentralize it to the lower level government structures such as local government authorities.

There are challenges associated with the efforts of introducing and scaling up the benchmarking model and its related tools and methods for assessing public procurement. To explore on the challenges of benchmarking in public procurement in the developing countries, Raymond (2008) investigated the technique of benchmarking to improve the quality of the public procurement process, using the case from Sri Lanka, a country with economy in transition. Although the investigation was limited to one country only, it still provides bullet points of challenges. One such key challenge that Raymond reveals is that "more control is placed in the hands of the bureaucracy with often politicians misuse this power, bringing about disastrous consequences for the country" (Raymond 2008, p. 788). Implicitly, public procurement reforms and application of process benchmarking are needed in the transitioning economies, if compliance, transparence, accountability, and value for money public procurement are to be achieved.

Overall, the track record of benchmarking in public procurement is scanty, particularly in developing countries, with only recent developments that end up at national level or federal level. Deliberate efforts are needed to strengthen the capacity of developing countries to put in place

policies and reforms that pave the way for process benchmarking public procurement.

## Magnitude of Public Procurement

Public procurement is one of the key functions of government, and public authorities are the principal buyers in many sectors such as energy, transport, waste management, social protection, and the provision of health or education services. The magnitude of public procurement outlays is surmountable, and it is expected to provide greater impact on the economy, if well managed. According to Musanzikwa (2013), the magnitude of financial transactions that involve public procurement managers worldwide is exorbitant and is observed to revolve around 10–30% of GNP. The International Budget Partnership estimates that developing countries spend $820bn a year on procurement-related transactions (Musanzikwa 2013). In Sub-Saharan Africa, the procurement market place is projected to stand between $30 and $43bn (Wittig 1999, p. 8). In Ghana, for example, public procurement, which covers the purchase of goods, works, and services, constitutes 14% of the country's GDP and 24% of total imports (Abbey 2009). In Tanzania, public procurement of goods, services, and works is the second largest expenditure after personnel emoluments. In 2011, the Controller and Auditor General's Report indicated that the total value of central government procurement expenditure stood at 41% for the financial year 2010/2011 (URT 2012). Unfortunately, procurement is one of the government functions most prone to corruption.

Transparency International reports that up to a fifth of the value of government contracts may be lost to corruption. For example, in 2009, the Public Procurement Authority of Ghana disclosed that "over 80 percent of state funds go into procurement after personal emoluments" (Abbey 2009). In their study on Public Procurement Reform, the Uganda Experience, Agaba and Shipman (2017) report that "many central government ministries and agencies are not following prescribed practices. The procurement audits carried out by the Public Procurement and Disposal of Assets (PPDA) have revealed that out of 322 contracts audited as at end 2005, only 7 (2%) were assessed as being clean, i.e., carried out in accordance with the law and with internal structures observed." On the same note, Zimbabwe is said to be the first African country to possess procurement Act but is still experiencing noncompliance challenges. Equally, South Africa is reported to experience several challenges including a "tendency not to utilize a competitive process for both quotations and bids, and incorrect utilization of the preference points system" (Ambe and Badenhorst-Weiss 2012, pp. 63–117).

Similarly, in Kenya, Tukamuhabwa (2012) and Gachio report that although Kenya has grown from a rudimental system without regulations to a systematic controlled and structured procurement system, still succumbs to noncompliance. According to Gachio (2014), all the procurement processes in Kenya were either marred by huge variations between the price announced at the opening of the tender and the price at which the tender was awarded or failure to ensure due diligence in the tendering process. Tanzania is also struggling with corruption in public procurement. According to Cho (2013), citing a 2011 PPRA audit of 315 procurement offices reports a widespread lack of compliance throughout the country, including 18 (procuring) entities with less than 50% compliance. About 10–25% of contract value is lost through corruption in Tanzania (Cho 2013). Thus, a well-managed and well-functioning public procurement system is needed, and this is particularly correct for developing countries where procurement normally accounts for a high proportion of total expenditure. Implicitly, the issue of procurement compliance is not something to do with purchasing professionalism, rather the professional approach in the procurement process. Benchmarking model would therefore provide both public procurement and regulatory authorities and public procuring entities with a professional approach to public procurement.

In sum, the public procurement regulatory authorities and procurement entities may not shy away in learning from the application of best

fit models that utilize performance results as benchmarking. Arguably, the importance of benchmarking is seen from the perspectives of improving performance and achieving accountability and compliance in public procurement practices.

## Synonyms

Faith; Procurement: acquisition; Contracting; Purchasing; Safeguard; Trust: certainty; Confidence; Credence; Expectation

## Definitions

Governments use public purchasing systems to obtain the resources necessary to perform tasks required to serve the public interest (Prier and McCue 2009). The relationship between public procurement and public trust refers to the confidence a government's citizens have in the effectiveness and incorruptibility of its purchasing system and in the competence and integrity of the officials who transact business within that system. Public trust also refers to the requirement that a government's employees safeguard its citizens' faith in the beneficial operation of the overall system, because trust itself is a public asset that, once lost, is difficult to recover.

## Introduction

Public procurement activities performed at all levels of governments and governance systems – local, national, and international – intimately impact the daily lives of people across the globe. Unfortunately, public trust in public procurement is not as widespread as the influence of those purchases. Scandal in public procurement settings can seem ubiquitous, whether a notorious transaction involves old-fashioned fraud, bribery, favoritism, and grift, or if the purchase appears exorbitantly unreasonable (as in the case of $400 hammers and $600 toilet seats), features potential administrative evils in the form of outsourced security forces and detention facilities, or if it requires cooperation and direct market interventions necessary to acquire lifesaving medical equipment to safeguard workers in a worldwide pandemic.

Officials who practice public procurement are often confronted by two persistent questions. First, why doesn't the government operate more like a business when buying goods and services? Second, how do we protect the government contracting process from corruption? With both questions, the essential public value at risk is trust in government. Confidence in the technical expertise and business judgment of public contracting personnel hinges on the first question (Kelman 1990). Faith in the integrity and ethical fitness of those officials, and in the procurement system they represent, informs the second question (Cooper 2002).

## Background

Although certainly salient, challenges to the public trust in public procurement are not new. In fact, the word "shoddy" stems from supplies obtained through a notorious government contract awarded during the American Civil War, and the term "merchants of death" refers to the bankers and armament contractors who reaped huge profits from the brutality of World War I (Nagle 1999). This also points to a key complication faced by both procurement officials and the contractors with whom they partner: conflation of the motivations and actions of a private entity that answers to its own shareholders with the intentions and integrity of the public partner.

It is possible that attention to the procurement tool itself as a governance function in public administration scholarship has been hindered by the perception that buying things is "boring" (Mashaw 1991, 511). A recent study shows that procurement scholarship is represented in only 1% of work published in the top international public administration journals between 1972 and 2017 (Trammell et al. 2019). Even in those studies, the specific focus on procurement as a discipline has been limited. In western contexts, discussions about "contracting" have been mostly related to the "hollowing out" of government rather than the performance of the procurements themselves from a disciplinary standpoint (Milward and Provan 2000; Light 2004, 2017).

Similarly, public values such as integrity, fairness, and transparency are common themes in governance scholarship in general (Van Ryzin 2011; Thomas 1998; Dobel 1990), but not necessarily in the scholarship on public procurement, which has tended to focus on the commercial and economic nature of the transactions involved with limited efforts to understand how public values impact the relational dynamics involved (Cooper 2002). This lack of focus, however, is changing,

particularly as procurement studies expand in the international context and explore both the cultural differences involved in those settings as well as the overarching ethical imperatives shared by all who work in public service contexts and must cultivate the public's trust.

## Trust as a Public Value

Trust is an essential element in the successful pursuit of goals achieved through the contractual mechanism across all sectors. Although comparisons to commercial practice are inevitable, various laws legislate public values such as integrity, fairness, and transparency in the conduct of a government's business relationships. Many commonplace business strategies used by individuals to influence buyers, while considered "marketing strategies" in the private world, would constitute corrupt behavior if accepted by a public servant. For example, in the US federal government, career employees with fiduciary responsibilities must adhere to codified standards of ethical conduct. These standards often require the annual filing of documents to ensure that officials are not influenced by personal interests that conflict with their professional responsibilities. Moreover, it is not only actual corrupt behavior at issue; procurement officials are required to guard against actions that *look* suspicious to a potentially hostile audience consisting of the contractor community and the taxpayer. Corruption in appearance can be as pernicious as corruption in reality because of its malicious impact on public trust (Cooper 2012).

However, it can be difficult for observers and researchers to assess the appropriateness of individual decisions, even when clear to professional insiders (Cooper 2002). Confidence in procurement officials' business judgment, their integrity, and in the broader procurement system itself may be inevitable casualties of this complexity (Brown et al. 2013). In some of the scandals previously noted, the controversies were augmented by either an unawareness or an inability to appreciate the differences between public and private behavior that are expected in the conduct of government procurement.

The actual legal propriety of many contracts that land in newspaper headlines can hinge on obscure details related to bureaucratic practice of little interest to anyone except professional procurement personnel. Yet the stench of suspected corruption taints attitudes towards the public procurement process long after the headlines disappear from websites and front pages. Though it may be easy to assess integrity in paper clip purchases or public openings where a contract is awarded to the lowest bid, the guidelines various contracting officials – to varying degrees – must know and the steps they must follow to conduct fair transactions can be both tortuous and highly constrained (Cooper 1980, 2002). This complexity reflects the interplay of vague or conflicting laws and legislation, esoteric common law decisions, and the regulations, direction, and guidance generated by various government entities at multiple levels, in multiple settings, and communicated through voluminous texts (McCue et al. 2015; Cooper 2002).

## Trust in the Contracting Relationship

Understanding the interpersonal and organizational relationships involved when a contract is used in governance is important to understanding how the contracting mechanism functions as a business tool and as a legal instrument. The public's trust is not the only consideration a public procurement official must weigh. As business managers, they must also appreciate the trust required for the successful completion of the contracting relationship. Trust in the integrity and competence of one's business partner is always an important element required for the successful completion of the contractual relationship, both in private and public management environments. However, the conflict between transparency in the public relationship and in the confidentiality commonly expected in mutually beneficial business relationships (particularly when innovative strategic alliances are involved) complicates the interpersonal and interorganizational dynamic involved and as well as the economic effectiveness of the contracting tool in the public setting.

Although technically a written contract exists to protect the individual property interests of those involved, most parties to a commercial contract rely upon legal enforcement of its terms only as a last resort – or when the social essence of the contract, or the relationship between the parties and their ability to negotiate with each other – has failed (Macaulay 1963; Macneil 1978). Often, the potential for future lucrative business arrangements between the parties leads to compromise and "best-customer" treatment in the operation of the interpersonal relationships involved. As such, there is considerable social capital involved in the microlevel transactions that occur in most commercial contracts that translates into real monetary value. However, widespread competition mandates, contract term limits, and the necessity of "arm's length" dealing between government officials and commercial contractors prior to awards of both new and recurring requirements makes this aspect of the relational contracting one of the especially "grey areas" of economic exchange where public procurement is concerned (Brown et al. 2013).

## Privity and Completeness in Contract

Another important element of trust in the business relationship that is complicated by the public context is the principle of "privity," or the idea that the parties to a contract have a special duty to each other to perform that excludes the interests of third parties (*Black's Law Dictionary,* Black et al. 1999). This is also represented by the ancient maxim *pacta sunt servanda,* or "promises must be kept" (Keyes 1996). In the public setting, however, this expectation of privity is complicated by the principal-agent relationship of the government buyer to their ultimate customer and stakeholder – those who inhabit the state and who are impacted by the effects of the procurement activity.

In the complexity of the public administration context, administrators must view their relationship to the public in three ways: as citizens, as customers, and as partners (Thomas 2013). Often, contracts made by government officials for one agency become key components of relationships not just with individual citizens, or with a commercial contracting community, but with other public partners, both at different government levels and with different public charters (such as nonprofit organizations). Trust is essential for the proper functioning for these cross-sector collaborations (Getha-Taylor 2012) – which complicates the concept of privity in public contracts.

As a result, trust also plays an important role in the degree to which a contract must be "complete," or the totality with which the written document captures the specific intents of the parties (Brown et al. 2007). Completeness, while it clearly apportions risk in the relationship, also has tendency to reduce the flexibility available to the parties during the actual conditions of performance. The greater the trust between the contracting parties, the less complete the specifications of a contract need to be – and as a result, the less expensive a service or product becomes as a consequence as a result of clear risk apportionment. In the public contract, however, there is always a third party – that is, the citizen – that has a vested interest in the outcome of the contracting relationship. This adds pressure on public procurement officials to make contracts as complete as possible, even if flexibility and economy are compromised in comparison to the expectations experienced by their commercial counterparts.

This is especially key because in public contracts, the reality is that failure is never an acceptable option, even when a contracting technique is especially innovative (Brown et al. 2013). The actions (or inactions) that a government takes in response to a perception by the public that a contractor has failed to perform a contract obligation (even when such performance is not specifically required in an actual contract) can contribute to the belief that a contract has been ineffective or that contractor's performance has been unsatisfactory and is not being enforced. This perception can remain even if a contract would have been completely adequate under normal circumstances, or if a contractor's performance has fulfilled all its legal promises. Therefore, a potential pitfall for public officials when using contracting as a governance tool happens when a procurement's costs

are reduced by omitting specifications for the sake of economy and flexibility, and something unexpected – or judged to be unlikely, occurs.

## Trust in Comparative Procurement

Trust is an element in the commercial transactions of every culture, though it may reflect different customs and norms. The recent boom in public procurement studies has been significantly boosted by work on an international scale, with important work being done in the European Union, across Asia and Africa, and particularly in the global South. The broad-ranging topical scope of the *Journal of Public Procurement,* entering its third decade in print, and collaborations such as recent anthology *Public Procurement: International Cases and Commentaries* (Knight et al. 2012), has increased the profile of public procurement scholarship in general and reflects the importance of procurement case studies that illuminate the specific contexts that face public administrators worldwide. Sources such as these help remind scholars that while public trust in public procurement is to some degree dependent on circumstances in addition to the specificity of legal and economic contexts, public trust is a universal concern wherever governments enter the marketplace intending to serve the public interest.

## Conclusion

All governments function poorly when they are not trusted by those they serve. One key indicator that a public entity deserves a bestowal of trust is that it manages the public tender with competence and with integrity. Public procurement, although it presents some challenges in terms of technical complexity and legal understanding, provides an important opportunity for citizens to evaluate how much trust their government has earned in terms of its incorruptibility, fairness, and transparency. Although scholarly attention to this important governance tool has been somewhat subdued historically, indications are that this is changing, and will hopefully continue to change, especially as public administration welcomes diverse voices from across the globe to contribute to studies about what makes public service valuable, ethical, and effective.

# Public Procurement and Social Justice

Rachel Henriques and Emily Harwood
University of West Florida, Pensacola, FL, USA

## Synonyms

Contracts; Egalitarianism; Environmentalism; Equality; Equity; Fairness; Governance; Prison; Public Procurement; Social Enterprise; Social Justice

## Definitions

Social justice in public procurement is the acquisition of works, goods, and services on behalf of a public authority in support of a fair and equitable society in which all individuals have equal access to rights, wealth, opportunities, and treatment.

## Introduction

Public Procurement accounts for 13% to 20% of Global GDP, making it a powerful instrument for social justice advancement (The World Bank 2020). The early impacts of social justice in public procurement can be seen through the enactment of labor laws in the eighteenth and early nineteenth centuries (Bureau of Labor Statistics 2015). Despite initial efforts to protect workers from abuse, discrimination, and hazardous working conditions, long-fought battles rarely afforded protection to the most vulnerable populations. As communities fought for stronger protections, expectations for socially responsible public procurement began to rise. Public agencies are expected to be good stewards of public funds and to act in the public interest. This dictates that consideration be given to how expenditures impact the quality of life of individuals within communities represented. Whether through implementation of policy, community investment, or the purchasing of goods and services, public agencies have an opportunity to impact poverty, discrimination, and environmental concerns; how and whether those opportunities are taken reflect the extent to which individuals in power act in the best interest of the people they represent.

This entry covers topics related to social justice in public procurement, including its roots in the environmental justice movement, advancement of social enterprises, and the utilization of private prisons and incarcerated labor.

## Environmental Justice

The civil rights movement in the United States helped to expose the myriad of disparities facing minority communities. As the United States Federal government took steps to provide equitable opportunities for minorities through anti-discrimination legislation, affirmative action, and

government contract set-asides, impacts of public procurement decisions rooted in classism and racism were harder to ignore (McCrudden 2004). Historically, minority and low-income communities have been overlooked and have suffered the consequences of a lack of meaningful investment. In stark contrast to business investments that benefit local communities, the construction of factories and landfills resulted in a reduced quality of life for millions of people due to water, air, and noise pollution. Where environmental impact and social justice converged, a new movement in the pursuit of environmental justice was born. The movement began in 1982, in response to plans by the State of North Carolina to place a hazardous waste landfill in Warren County, a small, predominantly Black community (U.S. Department of Energy n.d.). Following outcry from citizens who felt they were being marginalized due to their race and socioeconomic status, the United States Government Accounting Office (GAO) conducted a study to assess the placement of hazardous waste landfills in the southeast United States (U.S. Government Accounting Office 1983).

The need for public landfills and waste services and the placement of those facilities provides a critical point of understanding social justice and public procurement. According to the 1983 GAO study, three out of four landfills, located in Sumter County, Alabama; Chester County, South Carolina; and Warren County, North Carolina, were in predominantly Black communities. All four landfills, including Sumter County, South Carolina, were located in communities where 26% of residents had income below the poverty level – over 90% of which were Black residents (U.S. Government Accounting Office 1983). The study also points out a preliminary injunction against the placement of the Warren County waste landfill was dismissed by the Federal district court, and citing race was not a motivating factor in the placement of the landfill (U.S. Government Accounting Office 1983). Although the study supported concerns that low-income and minority communities were disproportionately affected by hazardous waste landfills in the southeast United States, it did little to show whether the landfill placement was born out of discrimination or simply the pursuit of lowest price/best value from the government perspective. While the government has a responsibility to seek best value, they must also consider with superior importance, the rights of citizens who live in areas that make them particularly vulnerable to undesirable investment. The GAO study seems quick to dismiss any discriminatory intent, but a lack of intent does not negate the government of responsibility for negative outcomes suffered by impacted communities.

Despite individual communities often feeling powerless to address local issues, collective efforts were able to draw more attention to a widespread issue. In response to rising concerns, the United States Environmental Protection Agency (EPA) formed the Environmental Equity Workgroup to assess the environmental risk burden that low-income and minority communities faced and what actions could be taken to mitigate those risks. Increasing support culminated in the First National People of Color Environmental Justice Summit in 1991 which brought together leaders of the movement from around the world. During the summit, leaders developed the Principles of Environmental Justice, which laid the groundwork for Executive Order (EO) 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, issued by United States President William Clinton in 1994, which required federal government agencies to focus on environmental justice as part of their overall mission.

In 2011, fifteen Federal agencies signed the Memorandum of Understanding on Environmental Justice and EO 12989. The renewed effort, spearheaded by the Interagency Working Group on Environmental Justice (EJ IWG), worked to create collaborative and innovative solutions to environmental justice issues. As part of the EJ IWG, the United States General Services Administration (GSA) has been positioned to impact social justice change within public procurement. In an effort to increase sustainable workplaces, GSA partnered with the EPA to develop the Smart Location Calculator. The calculator allows agencies to explore how building locations affect

worker commute and can reduce the impacts of pollution and cost burdens on local infrastructure (U.S. Environmental Protection Agency n.d.). Similar mapping efforts are being used in Europe to track noise pollution, which has been identified as a major environmental health problem. Under the Environmental Noise Directive, Member States are required to use noise mapping data to develop action plans for reducing and preventing noise pollution where exposure could have harmful health impacts (Directive 2002/49 2002).

Public investment in technologies like data mapping has allowed for innovative approaches to affordable housing, neighborhood revitalization, and sustainable development; however, not all development efforts benefit the community as a whole. Despite intentions to uplift underprivileged communities through revitalization efforts, public agencies run the risk of accelerating the process of gentrification (Maantay and Maroko 2018). In a new phenomenon known as "green gentrification," seemingly beneficial "green" community improvements, such as parks and community gardens, are giving rise to "improved property values, enhanced neighborhood aesthetics and reduced crime rates sufficiently to interest developers in investing in the neighborhood, whereby the community rightfully feels as though their hard work has sown the seeds of their own destruction" (Maantay and Maroko 2018; Maantay 2013, p. 40). The United States Department of Housing and Urban Development (HUD) issued a report in 2016, with four recommendations to create inclusive and equitable neighborhood change. They recommend public agencies, "preserve existing affordable housing; encourage greater housing development including, but not limited to, affordable housing; engage existing community residents; and take a broader look [at] using regional, rather than localized, strategies" (U.S. Department of Housing and Urban Development 2016, p. 2). Although gentrification is a concerning issue for underprivileged communities, HUD's report encourages public agencies to attack the larger issue of widespread poverty through attempting to harness the benefits of gentrification while minimizing the risks to low-income residents (U.S. Department of Housing and Development 2016). As global efforts to track the impacts of public procurement continue to advance, increased information sharing will allow for more informed decision making as agencies better understand how to balance government and community needs.

## Social Enterprise

The concept of trade for social purposes is not new, but it has evolved from its origins to meet the needs of diverse workforces around the world. Following World War II, Europe began integrating sheltered workshops to address the growing number of unemployed disabled veterans (University of Iowa and Hospital Clinics n.d.). The workshops gained popularity globally and expanded from employing persons with military service related disabilities, to adults with intellectual and nonservice related physical disabilities. As countries aimed to create a more inclusive workforce, the term social enterprise was adopted to reflect a more individualized and community based approach.

In 1971, the United States passed the Javits-Wagner O'Day (JWOD) Act, which requires all Federal agencies to purchase certain supplies and services from nonprofits employing blind and severely disabled persons. AbilityOne, the Federal agency responsible for administering the JWOD Act, provides employment opportunities for over 45,000 blind or severely disabled persons (AbilityOne n.d.). Canada, also a leading country in social enterprise, recently passed the Investing in Canada initiative, a long-term infrastructure plan that includes a requirement to help indigenous and marginalized communities by contracting with smaller social enterprises and providing funding for things like affordable housing and early childhood education (Government of Canada 2020). Another world leader in social enterprise, the United Kingdom, passed the Public Services (Social Value) Act of 2012, requiring that the government consider the social, economic, and environmental impact for public contracts and that the procurement must act to implement those considerations to better the local community

it will affect (UK Public General Acts 2012). In 2018, the Public Services Act was extended to explicitly mandate the evaluation of social value in procurement planning. By minimizing barriers such as project size and employing the use of industry and community input in procurement development, the government hopes to maximize service delivery through social enterprise.

Social enterprise has advanced well beyond its roots to become a substantial contributor to gross domestic product. In search of innovation, sustainability, and investment, public agencies have created incentives for social entrepreneurs to engage in public-private partnerships (PPP). The PPP creates a working relationship between the public and private sector to provide goods and services to the community. Financial vehicles such as grants, public venture capital funds, and social impact bonds are being used to draw investment from the private sector, providing much needed capital for social, environmental, and economic improvements (Sanchez 2018). Some private sector goals deviate from the standard public interest and transparency expected of public institutions; however, the shared responsibility offered through PPP provides a unique and mutually beneficial relationship that when managed correctly, allows for better public outcomes.

## Private Prisons and Incarcerated Labor

Public procurement and inmate labor within the prison system is a nuanced business. Although many countries use prisoners for work and labor, the United States has by far the largest prison population in the world both in number and by population. The USA maintains approximately 20% of the world's prison population yet makes up only 4.3% of the total global population; El Salvador, a few small Eastern countries, and several smaller islands rank next in prison population rate – the number of prisoners per 100,000 of the population (Walmsley 2018; United Nations Population Fund 2020). It is worth noting several of those smaller islands that rank high on the list are also US territories.

One benefit to the USA of the large prison population is the ability to contract business, increase revenue, and provide cheap labor. UNICOR, also known as Federal Prison Industries (FPI), is a wholly-owned US federal corporation that specializes in work programs for inmates. The corporation was founded in 1934 by the US Congress. The pay is low – averaging less than one US dollar an hour. The services are provided to the Bureau of Prisons (oversees care of imprisoned individuals) and are also available to the public for purchase (Federal Bureau of Prisons 2020). UNICOR is also able to bid on contracts with the federal government to provide services. The work done by incarcerated individuals has a wide range; they provide data services, call center work, dairy, farm supplies, mattresses, furniture, along with numerous other options.

In the 1980s, the federal government further expanded the business of incarceration by allowing the procurement of prison contracts with private corporations to manage prisons, rather than the government. The first corporation to acquire a private contract with the government was CCA, "Corrections Corporation of America," also known as CoreCivic. Currently, CCA and another private contractor, The GEO Group, accounts for over half of the total private prison contracts, with a combined multibillion dollar revenue. Many of these contracts involve a "minimum occupancy clause" between the government (whether federal or state) and the private contractor, requiring a certain number of prisoners to be retained in the beds at any given time, in order to guarantee a revenue profit for the contractor (In the Public Interest 2013). These private contract companies also utilize prison labor as a method of both offsetting the cost of inmates, as well as acquiring revenue – they function like a regular business corporation, even having publicly traded stock. Some prison contractors, such as GEO Group, have expanded to international locations for prison contracting, as well as into immigration facilities.

Prison labor can be used for either the government or the private contractor to directly produce goods to sell to the public, or they can be further contracted out to the free market for additional

labor at a lower cost to public businesses. Corporations and small businesses contract with prisons for various services at a bottom-level cost, without having to additionally pay for things like healthcare or other benefits. These companies can contract for labor resources, such as package assembly, electric work, building and construction, sewing, and agricultural farming – everything from growing cotton to raising fish farms. Many US state and local governments also utilize prisoners for services like custodial maintenance and kitchen work in government buildings and government houses, as well as for civic growth: prisoners have been used to build sidewalks, roads, water fountains, pipelines, buildings, and new police stations (Arizona Department of Corrections 2020; O'Donoghue 2017).

Common promotions of inmate labor include teaching labor skills to prepare for gainful employment upon release, reduced recidivism, restitution for victims, child support, and savings a prisoner can use while in prison to purchase goods, or to send to family to provide additional support. Another factor that may be the most important from a social justice perspective is the argument that work provides meaningfulness and contributive purpose in society for any individual.

Criticism of inmate labor typically revolves around a few elements: one being the wage for work, another being the element of labor while incarcerated itself, and lastly, whether the labor, and even incarceration itself, is economically beneficial to the public. Prisoners are paid far less than the federal minimum wage for the work they do. This is explained as an offset to room and board, transportation, and food costs, in addition to any victim restitution or child support owed. However, the low wage also contributes to problems with labor competition for lower-wage free workers, as the bottom line is exponentially cheaper for corporations and businesses to employ inmates for services or goods, rather than free people. Another dissent is with the morality of the unpaid or low-paid prison labor of human beings, which has often been compared to enslaved labor, particularly based on some of the US prisons being built on prior black slave plantations, and noting that the black incarceration rate is significantly higher than that of other races or ethnicities (Carson 2020). The competition of cheap labor against the free market has led to protests against the labor, arguing that it takes jobs from the working class. Several studies have been done on the economic and cost benefit to society, with findings that incarceration fails at a cost-benefit analysis to the public and that taxpayers actually end up paying billions every year for incarceration, with added negative impacts to individual communities and family units (Prison Policy 2016). Additionally, a more recent concern has been that of the exponential growth in recent years of immigration detention centers, both federally and under private contract, as they contract, operate, and profit in a similar manner to prisons (Haberman 2018).

Two practical ways to improve social justice issues with inmate labor would be to pay prisoners a higher wage and to reduce the number of incarcerated individuals (Prison Policy 2016). In paying a fairer wage for work, the prisoners could still achieve the benefits of learning a new trade or skill, as well as continue the personal growth work of providing meaningful contributions to society. Paying a fairer wage to prisoners may also naturally lead to a reduction in the high US incarceration rates, as any remaining incentives to acquire prisoners for cheap labor or business contracts would be challenged by having to pay higher rates – this would also help deter further morality issues (Gotsch and Bosti 2018; Prison Policy 2016). While a reduction in imprisonment for "lesser crimes" could lead to less revenue for the governments and corporations whose business contract revenues are based on high incarceration rates and inmate availability, it may ultimately lead to a more productive, free market society where families remain intact and free workers no longer have to compete for jobs with low-cost inmate labor (Moritz-Rabson 2018).

## Conclusion

Public procurement is an influential factor in a country's economy, sustainability, and welfare. It impacts business growth as well as individuals

within a community; thus, it is important for advancements in public procurement to reflect the needs and values of the community it serves. Just as labor protests, the civil rights movement, and environmental concerns shaped modern day public procurement, current efforts to address ongoing systems of oppression have the ability to influence future procurement policy. The more governments utilize procurement with attentiveness to the social implications, in addition to the benefits of public wealth and global economic growth, the more salubrious the whole of society will be.

# Public Procurement for Public Financial Management in Africa: Agency Theory Lenses

Justice Nyigmah Bawole and Peter Adjei-Bamfo
Department of Public Administration and Health Services Management, University of Ghana Business School, Accra, Ghana

## Synonyms

Africa; Central African Republic; Comparative analysis; Ethiopia; Ghana; Principal-agency theory; Public financial management; Public procurement

## Definitions

*Public procurement* is the process through which public sector agencies acquire goods and services from third parties to deliver public goods and services.

*Pubic financial management* involves a chain of activities from budget planning (by the executive) and authorization (by the legislative branch) to appropriation, apportionment, incurring liabilities through procurement and contracting operations, verification of prospective payments, cash management, and discharge of payment obligations, accounting, reporting, control, audit, and evaluation (Guess and Ma 2015).

## Introduction

Effective public financial management (PFM) system is one of the most significant concerns of government as it enhances economic stability, reduces cost on society, and optimizes the use of national resources necessary for developmental programs. Considering these benefits, significant amount of resources are being invested into strengthening existing PFM systems to address challenges that confront it. Donors and development partners such as members of the International Development Association (IDA) also demand PFM reforms as aid conditionality, particularly in sub-Saharan Africa, to ensure value for money (VfM), improved national revenue mobilization efforts, economic efficiency, and financial control (Hadley and Miller 2016; PEFA 2010). Hence, the Public Expenditure and Financial Accountability (PEFA) framework have become key assessment tools for PFM in several administrative systems (Leruth and Paul 2006). However, prior studies (Peterson 2010; Betley et al. 2012; PEFA 2016) suggest that desired outcomes of these reforms are barely realized with instabilities in the few that experienced some improvements. Attempts to explain these instabilities have been contested and inconclusive (Betley et al. 2012; Leruth and Paul 2006). In this chapter, the limitation is addressed from the public expenditure side of PFM reforms.

Public procurement, the larger component of public expenditure after salaries, accounts for about 15% to 20% of public expenditure globally, and up to 70% in developing countries (see Thai 2001; World Bank 2012). Public procurement is an essential tool for government considering its link with the pillars of effective governance: improved public service delivery, VfM, and an enabling environment for private sector-led growth. The World Bank (2012: 6) report argues "...public procurement reform can contribute directly to improving a country's business,

investment, and social environments." How do public procurement practices influence effective PFM in Africa? This chapter presents a comparative analysis of public procurement and PFM practices of three African countries: Ethiopia, Ghana, and Central African Republic. Drawing on the principal-agency literature, the chapter argues that certain idiosyncrasies inherent in their respective public procurement environment pose agency problems or serve as an agency cost in PFM.

The rest of the chapter is structured as follows. A conceptual overview of PFM and public procurement are presented in the next section. This chapter further discusses the principal-agency literature. Details of the research methodology follow. Key findings are then presented and discussed. The chapter finally concludes and outlines the study's implications for public procurement practice and research toward effective PFM in Africa.

## Conceptual Overview

### Public Financial Management

PFM encompass a "chain of activities from budget planning by the executive and authorization by the legislative branch to appropriation, apportionment, incurring liabilities through procurement and contracting operations, verification of prospective payments, cash management, and discharge of payment obligations, accounting, reporting, control, audit, and evaluation" (Guess and Ma 2015: 129). Each of these activities has been scrutinized separately by scholars and development agencies with the aim of enhancing PFM globally (Betley et al. 2012; World Bank 2012). Particularly, the PEFA framework was introduced in 2005, to harmonize donors' effort: (i) to understand the reform agenda of beneficiary country, (ii) to coordinate support programs, and (iii) for a shared information pool on PFM (Hadley and Miller 2016). The PEFA framework is currently the most effective tool used by development agencies for assessing related fiduciary risks in PFM systems (PEFA 2010; Betley et al. 2012). With seven main pillars, the framework aims to promote inter alia budget reliability, transparency of public finances, policy-based fiscal strategy and budget, predictability and control in budget, and external scrutiny and audit.

This chapter focuses on how public procurement environment in Africa influences effective PFM. Out of the 31 indicators of the PEFA framework, indicator P1–24 defines public procurement (PEFA 2016). Indicator P1–24 emphasizes transparency, monitoring, competitiveness, and the availability of complaint systems in the procurement process. The public procurement literature is replete with studies examining these areas (Kauppi and Van Raaij 2014; Parker and Hartley 1997; Thai 2001).

### Public Procurement

Public procurement is the procedure through which public sector agencies acquire goods and services from third parties. This includes buying, renting, leasing or acquiring supplies, and construction services. Public procurement is considered a major economic activity of government as it accounts for greater proportions of national expenditure (Thai 2001; World Bank 2012). Most governments use public procurement to advance a wide variety of outcomes such as promoting social and environmental outcomes (Adjei-Bamfo and Malorah-Nyamekye 2019) and reducing public sector corruption. Parker and Hartley (1997), however, contend that such broad outcomes make the public procurement practice vulnerable to vagueness and unnecessary use of discretion.

A number of principles (also consistent with P1–24 of PEFA) guide the public procurement practice (PEFA 2016). These include accountability, transparency, competition, VfM, and complaint systems. These general principles are mostly enforced through the provisions enshrined in respective national procurement laws meant to promote the tenets of good governance and citizens' welfare. Notwithstanding its significance, the procurement function in Africa is marred with delays, excessive corruption (Ameyaw et al. 2012), lack of transparency, accountability, and competition among others. For example, public procurement corruption in sub-Saharan Africa is

estimated at US$148 billion which is explained by 20% to 30% price rise in about 70% of all public contracts (Ameyaw et al. 2012). This may thwart national development by depressing external investment, weaken public institutions, and erode public trust. Hence, the numerous reforms in the public procurement practice in Africa. Yet, all efforts to improve PFM through public procurement reforms appear to have failed to yield sustainable outcomes. This chapter explains this phenomenon from the lenses of the agency theory.

## Principal-Agency Theory

The principal-agency theory describes the relationship between an individual actor (the principal) who has contracted another (the agent) either explicitly or implied, to undertake a responsibility on his/her behalf. The theory assumes a divergent interest between the principal and the agent (Jensen and Meckling 1976). Thus, the agent, in the performance of his assigned task, may pursue his/her personal interests – causing an agency problem. Jensen and Meckling (1976) recommend monitoring and incentive tools (agency cost) for addressing this problem.

Recent literature suggests that the agency theory has grown significantly over the last two decades. Particularly in public administration, the application of the agency theory is considered as a political institutional theory – making its more complex and fuzzy (Farazmand 2002; Adjei-Bamfo and Maloreh-Nyamekye 2019). Despite the theory's promise in analyzing public contracting, it is criticized on grounds that it fails to emphasize the cooperative and coercive element of social contracts as a result of unequal power distribution in bureaucracies (see Farazmand 2002: 41). Although the theory appeals to powerful elites, it is mostly difficult to hold them accountable to their actions. In this chapter, however, the strand of the agency theory is extended in the context of public procurement to explain the instabilities in PFM outcomes in Africa.

## Methodology

A comparative case study design was employed. Three cases were sampled from Africa based on three main criteria. First, the study identified countries that have either benefited or are currently under the HIPC initiative. This was to ensure that selected cases had experience with international PFM standards through interventions from the IDA. Researchers then selected three countries: Ghana, Ethiopia, and the Central African Republic from the Western, Eastern, and Central African subregions out of the 30 African countries identified with HIPC experience (World Bank 2016). Finally, the three countries were selected based on available data from the comprehensive dataset used.

The analysis was supported with descriptive data from the Global Integrity Index (GII) of the Transparency International and the World Bank's Country Policy and Institutional Assessments (CPIA) to extend the evidence base of the analysis. Three relevant indicators of PFM based on Guess and Ma (2015) were extracted from the CPIA data source: "quality of budget and financial management," "efficiency of revenue mobilization," and "transparency, accountability, and corruption in public sector." The World Bank mostly uses these indicators for the allocation of concessionary loans to client countries. These indicators serve as agency cost for advancing the canons of effective PFM (see Fig. 1). From the GII, however, "citizens' access to procurement results and contract documents," "competitive bidding," and "ban of bad suppliers" were also extracted. These are consistent with the procurement indicators (P1–24) of the PEFA framework. They help to explain how potential agency problems in public procurement are controlled.

## Discussion of Findings

This section foremost discusses the agency theory-related issues in public procurement environment and explains the instabilities in PFM outcomes in Africa. Based on Fig. 1, this chapter

delineates the agency problems and agency costs with the nature of governance, certain economic variables, and cultural values underlying the public procurement environment in Africa.

## Agency Issues in Public Procurement and PFM

### Information Asymmetries

Public procurement in Africa is characterized by information gaps (see Figs. 2 and 3). Partly from vagueness in specifying the terms of procurement contracts and deliberate actions by leadership, inadequate procurement information stimulates opportunism resulting from the divergent goals of procurement stakeholders (see Kauppi and Van Raaij 2014). In view of the information gaps and the widespread perception of procurement corruption, Ethiopia reformed its procurement regime with the enactment of Procurement and Property Administration Proclamation No.649/2009 to harmonize the procurement practice. Chekol and Tehulu (2014) observed that this introduced transparency, awareness, and clarity into Ethiopia's public procurement regime. Meanwhile, the IMF reports that transparency outcomes at CAR are still low despite support from the IDA.

In Ghana's case, the Ghana Integrated Financial Management Information System (GIFMIS) was launched in 2009 at the cost of US$ 120.52 million to minimize information gaps. Among other things, GIFMIS was meant to promote efficiency, transparency, and accountability in PFM through rationalization and modernization of budgeting and public expenditure management. Figures 2 and 3 show that transparency features of GIFMIS have largely enhanced access to procurement-related information and increased competitive bidding in Ghana.

**Public Procurement for Public Financial Management in Africa: Agency Theory Lenses, Fig. 1** An agency framework for comparative public procurement and PFM in Africa

**Public Procurement for Public Financial Management in Africa: Agency Theory Lenses, Fig. 2** Transparency, accountability, and corruption in the public sector (World Bank CPIA, 2006–2015)

### Guidance and Monitoring

Guidance and monitoring systems in public procurement are also critical for effective PFM. Indicator P1–24 of the PEFA framework maintains that there must be accurate and complete data on types of items procured, their value, and contract with awardees for all methods used (see PEFA 2016). Figure 2 indicates that only Ghana lies above average in transparency and accountability. Thai (2001) notes in his framework on public procurement system that accountability in the practice provides the relevant feedback element for measuring specific performance goals that may be necessary for improving existing systems.

However, the pressure to comply could be limited in instances where "agents of accountability have at best a weak appreciation of the issues" (Schapper et al. 2006: 3). Hence, Kauppi and Van Raaij (2014) argue for the training of public procurement managers to familiarize themselves with procurement regulations. Consistent with the data, Chekol and Tehulu (2014) and Peterson (2010) emphasize the benefits of appreciation for Ethiopia's public procurement laws. Effective guiding and monitoring systems may address the problem of "honest incompetence" (Kauppi and Van Raaij 2014). These systems constantly update stakeholders and maintain reliable data for the feedback element of the public procurement system toward improved PFM outcomes.

### Control and Sanctioning Regimes for Compliance

Controls involve both internal and external systems like authorization, appropriation, rewards, and other sanctioning measures. Internal organizational mechanisms may provide incentives to control agency parties (principal and agent) from opportunism (see Eisenhardt 1989). For example, Fig. 4 provides evidence of the ban (disqualification of bad suppliers from tender selection process) as a sanction in public procurement. Figure 4 revealed that CAR is not committed to banning bad suppliers from participating in future bids compared to Ghana and Ethiopia.

While Ghana maintains an average position, Ethiopia had a perfect (100%) performance in 2014 but relapsed. This demonstrates a general weakness in control and complaint systems as such bans are usually the outcomes of effective monitoring systems both in the selection process and in the cause of delivering the contract terms. Sanctions stimulate compliance with contractual

terms. To administer this in a fair and just manner, most central procurement agencies in line with the third dimension of P1–24 indicator of the updated PEFA framework have instituted special authorities responsible for addressing procurement grievances otherwise associated with such sanctions (PEFA 2016).

## Public Procurement Environment in Africa

Three key variables underlying the public procurement environment in Africa explain the dynamics and influences of the unstable PFM reform outcomes. Based on Fig. 1, these are discussed from the lenses of the agency theory.

### Government Structure

As a federal parliamentary republic, Ethiopia seems to enjoy a high level of transparency in public procurement than Ghana. However, Ghana's system of governance has comparatively improved its public finances through relatively stronger political systems and vibrant third sector (external pressure). Unlike the parliamentary system where the executive is more accountable to the legislature, accountability in the presidential system is partly facilitated by external pressure from civil society organizations. Their endorsements serve as incentives for inducing political commitment – a catalyst for successful PFM reforms (Betley et al. 2012).

In Ghana's case, for example, Betley et al. (2012) argue that political executives usually have strong incentives for committing to public procurement and PFM system in early parts of the administration, but this gradually wanes over as other political priorities come to play. Figure 5 corroborates this (see election years 2008 and 2012 for Ghana; 2011 for CAR; 2010 for Ethiopia). It is therefore plausible to conclude that parliamentary governance systems with higher democratic status are more capable to formulate and to sustain enforcement of PFM systems than presidential systems of governance that have a fixed tenure. This is because the oversight role of parliamentary systems of governance serves as the agency cost for citizens and provides the required incentive for political executives to comply with procurement laws in PFM (see Betley et al. 2012; Jensen and Meckling 1976; Eisenhardt 1989).

### Economic Variables

Economic variables also impact PFM in Africa. Over the last 50 years, Africa has experienced a fast rate of population growth along with urban poverty, insecurity, and high levels of inequality, which pose threats to economic stability (Abdulai and Hickey 2016). Compounded with high debt levels and mismanagement of public funds, this has resulted in several African countries seeking interventions from the IDA under the HIPC initiative. For instance, the debt reliefs and improved budget systems resulted in a $515 million GDP growth in CAR's economy between 2007 and 2011 (World Bank 2016) but declined subsequently (see Figs. 5 and 6). With the support of the IDA, Ghana and Ethiopia also received other assistance including the GIFMIS system. However, performance outcomes from the PFM and public procurement indicators do not commensurate expectations of the reforms.

Explaining this phenomenon, Betley et al. (2012) view that political leadership and will to

**Public Procurement for Public Financial Management in Africa: Agency Theory Lenses, Fig. 5** Quality of budget and financial management (World Bank CPIA, 2006–2015)

**Public Procurement for Public Financial Management in Africa: Agency Theory Lenses, Fig. 6** Efficiency of revenue mobilization (World Bank CPIA, 2006–2015)

enforce PFM regulations are often minimized in their quest to sustain their political tenure. The burgeoning political settlement literature also suggests that members of the ruling government allocate resources legally and illegally through the award of public contracts to "patron-client networks," who in turn sponsor their campaign. Such adverse selection continues to widen development inequalities and inform instabilities in PFM outcomes in Africa.

### Cultural Value

Cultural values also inform public procurement practice in Africa. The culture of a society has some implications for compliance with rules and regulations such as public procurement and PFM. Yeboah-Assiamah et al. (2016) contend that Africa is a highly collectivist society and blames its high public sector corruption on its collectivist culture. Thus, collectivist culture disapproves of whistleblowing as it disrupts its unity. Hence, these societies are most likely to contain unethical behavior rather than reporting them. Particularly, gifts – which are culturally acceptable in administrative environment in Africa – have a tendency of compromising procurement officials in favor of gift givers. Such societies also fail to demand accountability from public officials (perceived as corrupt) due to unlimited socioeconomic demands from the extended family system. These values often create conflict of interest situations for public/procurement officials.

Consequently, compliance with public procurement and PFM rules in Africa are undermined by such unfavorable cultural practices as control mechanisms (agency cost) and incentives meant to elicit compliance with PFM practices (Eisenhardt 1989; Leruth and Paul 2006) are weakened. It is, hence, plausible to suggest that these collectivist countries are often challenged by weak enforcement mechanisms, which explain their inability to sustain PFM efforts amid numerous reforms.

## Conclusion

This study extends and enriches the strand of the principal-agency literature in public procurement management for PFM. This comparative study explains how factors characterizing the public procurement environment in the African context affect PFM outcomes with cases from Ethiopia, Central African Republic, and Ghana. The chapter concludes that the instabilities in PFM reform outcomes in Africa are largely due to three main country-specific variables underlying the public procurement environment: governance structure, economic variables, and cultural values. From the agency theory lenses, these factors affect the agency cost in public administrative systems necessary for addressing the agency problems in public procurement management toward desired PFM outcomes. Significant implications for research, the public procurement practice, and PFM in Africa are highlighted.

## Definition

Russian public procurement system, its features and shortcomings; the specifics of the procurement process in Russia, its weaknesses, and ways to solve the problems.

## Introduction

In 2016, notices were placed in the unified information system (UIS) for public purchases totaling about 6.5 trillion rubles (108 billion US$). The total value of concluded contracts was about 5.3 trillion rubles. Economic gain as a result of public procurement has reached 420 billion rubles annually. The average reduction in prices after competitive purchases is 8.2%. The average number of participants in purchases is about 2.7. The prevailing method of defining the supplier is

electronic auction, which makes up 58.3% of the total number of notices placed in the UIS. More than 610.9 billion rubles of public procurement money are directed to small businesses.

A total of 674,400 contracts, with a value of 241.3 billion rubles, were concluded with application of antidumping measures (20.1% of the total quantity and 4.6% of the value of all contracts concluded in 2016).

## Concept of the Contract System

On 1 January 2014, the Federal Law of 5 April 2013, No. 44-FZ "About the contract system in the sphere of purchases of goods, works, and services for ensuring the state and municipal needs" came into force.

Earlier attempts to create a contract system were made in the 1990s. The decree of the Russian President on 7 August 1992, No. 826 "About measures for formation of federal contract system" provided the measures for creation of the mechanism of government procurement in market conditions (except for goods with state-regulated prices).

In essence, the competitive mechanism for selection of applicants for the conclusion of state and municipal contracts was fully created in 2005 when the first law on public procurement was adopted in modern Russia (the Federal Law of 21 July 2005, No. 94-FZ "On Placing Orders for Provision of Goods, Works, and Services for State and Municipal Needs").

The shortcomings of this law, which went through numerous changes, soon became evident. There was an awareness that the law was in need of improvement, not only regarding rules on the selection of suppliers (contractors, performers), but also regarding other stages of government and municipal procurement. The main shortcoming of this law was that it focused on bidding, without sufficient attention to the planning, implementation, and audit phases of public procurement.

The Russian contract system is a set of legal, organizational, and economic measures aimed at fulfilling state and municipal needs for goods, works, and services by means of the following interconnected stages:

- Forecasting and planning
- Bidding
- Implementation of contracts
- Control and audit

A systems approach to the regulation of public procurement is shown in expansion of the law at the stages of planning, performance of contracts, monitoring, audit, and control. Such an approach is not widely known and, to some extent, is equivalent to Russian "know-how."

Another unique feature of the Russian procurement system is the UIS. The UIS contains data on purchases by public educational and legal entities with state involvement, and organizations carrying out various types of activity. The system facilitates access to information by potential suppliers (contractors, performers). Furthermore, the system allows competitive selection of suppliers and leads to increased efficiency of purchasing activities.

### Planning in the Russian National Contract System

Planning is carried out by means of the following documents:

- Plans of purchases (three-year planning horizon)
- Scheduled plans of purchases (one-year planning horizon)

Plans of purchases are documents that contain the list of items to be provided in the next year and the planning periods for ensuring federal needs, the needs of territorial subjects of the Russian Federation, municipal needs according to state programs of the Russian Federation, target programs, plans and development programs for the territorial subjects of the Russian Federation and municipalities, and other documents related to program and target planning approved in accordance with the established procedure.

Purchase plans are developed and approved by the main managers of the relevant budget for a

term of not less than 3 years, including the next year and planning period.

The formation, approval, and maintaining of procurement plans are approved by the Government of the Russian Federation.

Plans of purchase must include the following:

1. The names of purchases according to the documents of program and target planning, with assignment of a unique identification code
2. General, objective, and functional description of the subjects of purchases necessary to ensure that needs are met
3. Budgetary funds needed for purchase of each subject of purchase, within budgetary appropriations according to the law (decision) on the budget for the next financial year (the next financial year and planning period)
4. Terms (frequency) of implementation of the planned purchases
5. The expected result of implementation of purchases, including indicators of satisfaction of state and municipal needs
6. Other data determined by the Government of the Russian Federation

Any needs that are not provided by the documents of program and target planning can be included into the purchase plans approved for the period up to 1 January 2013.

The unique identification code for each purchase consists of the budgetary classification code; code of the All-Russian Classification of Economic Activities (OKVED); code of the All-Russian Classification of Economic Activities, Production, and Services (OKDP); and an individual number.

Scheduled plans for purchases of goods, works, and services for state and municipal needs are documents that contain a list of purchases and customers for the next year and the basis for their implementation.

Scheduled plans are formed by customers according to plans of purchases within the limits of budgetary appropriations for customers in the next financial year, the budget of territorial subjects of the Russian Federation, the local budget, and budgets of the state (territorial) off-budget funds.

Scheduled plans include the following data:

1. Unique identification code of purchase
2. Terms of the contract, including the names of items to purchase; minimum necessary requirements for the subject of purchase; the quantity (volume) and the planned terms (frequency) of purchase of goods, works, and services; the initial (maximum) price of the contract, including the size of advance payment (if appropriate), with a breakdown of payment stages (if purchase, including performance of the contract, is provided step by step)
3. Additional requirements for participants of procurement procedures (if existing)
4. Method of purchase
5. Schedule of implementation of procurement procedures according to the specified method of purchase
6. Surname, name, middle name (if available), position, and contact information of the authorized official acting on behalf of the customer (contract service of the customer)

In addition, justification of implementation of purchases, which is an integral part, is included in the scheduled plan.

The rule is that purchases cannot be made if they are not accompanied by scheduled plans.

### Initial (Maximum) Price of the Contract

The initial (maximum) price of the contract at the announcement of purchases is provided in the Russian system of public procurement.

Customers must be guided by the following methods for determining the price:

1. *Standard method*: This is understood as calculation of the price of the contract on the basis of standards. This method is applied in cases where legal acts have established standards concerning goods, works, and services (including their ceiling price, quantity (volume), and quality).
2. *Method of one price*: According to this method, the price of the contract is determined by the price established by the organization

that is the only producer (supplier) of goods (works, services) or has the exclusive right to goods, works, or services. The method is applied in cases where the goods (works, services) are made or delivered by one organization or for which one organization has the exclusive rights.

3. *Tariff method*: The price of the contract is defined according to the established tariff (price) of goods (work, service).
4. *Indexation method*: The price of the contract is calculated according to the price of similar goods (works, services), in comparable conditions, that were purchased by the customer in the previous (current) year. The price indexation is fixed according to the rate of inflation (proved by the customer or using another coefficient). This method is applied in cases where the purchase of goods, works, or services is similar to the purchase made by the customer in the previous (current) year.
5. *Request method*: This method is used in addition to the indexation method, and in other cases when there is a competitive market of suppliers (performers, contractors) for necessary goods (works, services). In this case, the cost of goods, works, or services is defined by studying price offers, including the structure of the price, of not less than five organizations that can deliver such goods, works, or services.
6. *Other methods*: These are provided by the customer in cases where it is impossible to use the methods listed above.

The following are sources of information about the prices of goods, works, and services that can be used to determine the initial (maximum) contract price:

1. Data from state statistical reports
2. Data contained in the UIS
3. Register of contracts
4. Information about the prices of producers
5. Public results of market studies
6. Market research conducted at the initiative of the customer
7. Other reliable sources of information

The Government of the Russian Federation establishes the exhaustive list of sources of information that can be used for determination of the initial (maximum) price of the contract.

## Bidding Process

In the Russian contract system, customers have the right to use the following bidding methods:

1. *Open competition*: Open competition information on purchase is given by the customer to an unlimited circle of people by placing a notice in the UIS. The winner is the company that offers the best terms of performance of the contract (price as well as quality).
2. *Competition with limited participation*: Under a competition with limited participation, information on purchase is given by the customer to an unlimited circle of people. Then, the competition with limited participation is held. Limitation is based on a prequalification procedure. The winner of a competition with limited participation is the provider that has gone through the prequalification selection and offers the best terms of performance of the contract.

   Such competition is held in cases of high-difficulty or specialized services and works. Only a limited number of suppliers (performers, contractors) are capable of offering such goods or executing such services.
3. *Two-stage competition*: A two-stage competition is where the winner is the provider who participates in two stages of bidding and offers the best terms of performance of the contract according to the results of compliance with the tender documentation.

   The customer has the right to apply the procedure of this type of competition in the following cases:
   - The customer has concluded that specification of the characteristics of a subject to purchase needs to be discussed with suppliers (contractors, performers).
   - A competition is held for a contract for carrying out scientific research, project work, experiments, research, or development (except in cases where such a contract provides production of goods in quantities

sufficient to ensure their commercial profitability or reimbursement for research and development), for creation of literary works or art, for performance or execution (as result of intellectual activity), and for financing the hire or display of a national movie.

4. *Electronic auction*: The customer is obliged to apply the procedure of an electronic auction for procurement of goods, works, or services included in the list established by the Government of the Russian Federation.
5. *Request for quotation*: This method of bidding involves reporting information on the needs of customers for goods, works, or services to an unlimited circle of people. The winner is the provider offering the lowest price for the contract.
6. *Request for proposals*: Requests for proposals are carried out by the contract service of the customer, who has the right to carry out purchases by means of a request for proposals in the following cases:
   - There is an urgent requirement (e.g., because of an extraordinary event).
   - The procedure of purchase previously carried out by the customer is recognized as cancelled and the customer has come to the valid conclusion that repeated holding of procedures of purchase, taking into account urgency of purchases, is inexpedient.
7. *Closed ways of purchasing goods, works, and services*: Under closed procurement procedures, information on purchase is given to a limited circle of providers, who meet the requirements and are capable of delivering goods, performing works, or rendering services that are the subjects of competition and who have access to data that are state secrets. Such purchases are carried out only in the following cases:
   - Purchase of goods, works, services, or data that are state secrets, provided that such data are contained in documentation on the implementation of purchase or in the draft contract.
   - The conclusion of contracts for rendering services in insurance, transportation, and protection of values of the state fund of precious metals and gemstones of the Russian Federation, or for rendering services in insurance, transportation, and protection of museum objects and museum collections, rare and valuable editions, manuscripts, and archival documents (including their copies) having historical, artistic, or other cultural value and transferred by customers for temporary possession and use or for temporary use to natural and legal entities, including in connection with holding exhibitions in the territory of the Russian Federation and (or) territories of foreign states.
8. *From the only source*: Exceptional cases of single source procurement include 25 situations, including the following examples:
   - The contract of power supply or purchase and sale of electric energy with the guaranteeing supplier of electric energy.
   - Services in water supply, water disposal, sewerage, heat supply, gas supply (except for services involving liquefied gas), connection (accession) to utility networks at the prices (tariffs) regulated according to the legislation of the Russian Federation.
   - Goods made, works performed, and services rendered by institutions and penal correction systems according to the inventory, works, and services approved by the Government of the Russian Federation.
   - The contract for the visit of a zoo, theater, movie theater, concert, circus, museum, exhibition, or sporting event.
   - The contract (contract) for rendering teaching services by individuals.

## Joint Procedures of Purchase

The possibility of holding joint procedures of purchase is provided in the Russian contract system. Such purchases are possible if two or more customers need the same goods, works, or services.

In this case, one of customers acts as the organizer of purchases. The other customer transfers, on the basis of the agreement, part of the functions of the organization and holding of joint

procedures of purchase. The specified agreement has to contain the following:

1. Data about the parties of the agreement
2. Data on types and estimated volumes of purchases for which joint procedures of purchases are carried out
3. Rights, duties, and responsibility of the parties of the agreement
4. Information about the organizer of joint procedures of purchases, including the list of functions transferred to him by the parties of the agreement
5. Order and terms of formation of the contest (auction) committee on implementation of purchases, and also regulations of work of such commission
6. Order and terms of development and approval of tender (auction) documentation
7. Approximate terms of holding joint procedures of purchases
8. Procedure for payment of the expenses connected with the organization and holding of joint procedures of purchases
9. Period of validity of the agreement
10. Order of consideration of disputes and appeals
11. Other information defining the relationship of the parties of the agreement during the holding of joint procedures of purchases

The rights, duties, and responsibility of customers during the holding of joint procedures of purchase and an order of holding such procedures are defined by the agreement of the parties according to the Civil Code of the Russian Federation and the bill. The contract with the winner or winners of joint procedures of purchase is with each customer. Such contracts are subject to execution by the parties according to the Civil Code of the Russian Federation and other federal laws taking into account the provisions of the bill.

The parties of the agreement incur expenses on holding joint procedures of purchase in proportion to the share of the initial price of the contract of each customer in the total amount of the initial prices of contracts.

### Centralized Purchases

According to Russian purchasing law, centralization of purchases can be created by federal executive authority, executive authority of the region of the Russian Federation, and local government authorized for holding procedures of purchases for customers. Public procurement is highly centralized only at the regional level – a federal procurement agency is not established.

### Contract Service of the Customer

Another feature of the Russian contract system is the creation of a contract service for customers. The contract service organizes planning and implementation of purchases by public agencies.

The contract service is an independent structural division of the customer (department, head department, management department) and is headed by the head (chief).

The contract service carries out the following functions and powers:

1. Participates in preparation of the purchase plan.
2. Develops the scheduled plan of purchases, makes any changes or revisions, and places the plan in the UIS.
3. Prepares drafts of documentation relevant to placement of state orders.
4. Conducts procurement, including conclusion of the contract. During conclusion of the contract, the customer designates the official responsible for performance of this contract (the contract officer) from among the staff of the contract service. The contract officer can be responsible for performance of several contracts.
5. Prepares and places documentary reports in the UIS.
6. Provides performance of the contract and accepts results of the contract.
7. Ensures completeness and satisfaction of the needs of the state and municipalities regarding the supplied goods, works, or services by monitoring the performance of contracts, market research, and monitoring prices, with the aim of increasing purchase efficiency, including at the stage of performance of the contract.

8. Participates in cases appealing against the results of the held auction, and conducts claims activities
9. Consults with suppliers (contractors, performers), in case of need, at the planning stage to define a condition of the competitive environment on the corresponding market of goods (works, services), and to define the best technologies and make other decisions for ensuring that needs are met.
10. Carries out other powers provided by the bill.

The contract service interacts with other structural divisions of the customer, the federal executive authority (which carries out law-enforcement functions to ensure performance of the federal budget), the control body, and the public authority authorized to carry out audits in the federal contract system.

Employees of the contract service need special knowledge and skills in the sphere of purchases, a higher education, and experience in the sphere of purchases. The contract manager should have completed not less than 3 years of service in the sphere of purchases. All specified persons bear personal responsibility for performance of their functions and powers.

Assignment of the contract service to functions that are not provided by the bill is not allowed.

## Contract Audit and Control in the Contract System

A contract audit is the systematic and documented process of verification, by the customer, of objectively obtained and estimated data in order to assess the efficiency of planning and implementation of purchases.

A contract audit is booked by the public authority authorized to carry out audits in the federal contract system. There are two types of audit:

1. *Complex audits*: These are carried out by verification of the constituent, registration, planning, reporting, accounting, and other documents relating to purchases (carried out not more than once a year).
2. *Thematic checks*: The activity of the customer is checked in a single control action or research on a certain site of activity of the customer. Checks are carried out on the basis of the motivated addresses and statements from natural and legal entities, public associations on control, public authorities, and local governments, and also on the basis of information contained in the UIS. Such inspections of customer activity are obligatory for contracts with only one source, and for other contracts as determined by the decision of the Government of the Russian Federation.

Control in the federal contract system represents the activities of authorized government bodies directed to the prevention, identification, and suppression of violations by public authorities, local governments with powers in the federal contract system, and legal entities that carry out activities in federal contract system, their heads and other officials of the requirements established by the bill or other acts of the Russian Federation. Control is by means of the organization and conducting of checks, by acceptance of the measures for suppression and (or) elimination of the consequences of the revealed violations as provided by the legislation of the Russian Federation, and by other activities of the specified authorized government bodies for control in the federal contract system relating to the execution of requirements of the legislation of the Russian Federation.

Control is carried out in the form of planned and unscheduled inspections.

Unscheduled inspections are carried out at the address of the participant in the procedures of purchases in the cases of complaint regarding actions (or inaction) of the customer or receipt of information about a violation of the law of the Russian Federation. The complaint is considered in a 10-day period.

## Public Control

In Russia, citizens and organizations are granted the right to exercise public control over observance of the requirements of the legislation in a purchase order and on the conditions established. Public authorities and local governments are obliged to provide the possibility of such

participation in the order and form established by the bill and other regulations of the Russian Federation.

For this purpose, citizens have the right to unite on a voluntary basis in public associations whose primary authorized activity is implementation of public control according to provisions of the bill. The specified associations have the right to carry out the following activities:

1. Prepare suggestions for improvement of the legislation of the Russian Federation in the sphere of the federal contract system.
2. Request customers to provide information about implementation of purchases and the progress of execution of contracts.
3. Carry out independent public monitoring and assessment of the course of implementation of purchases, including evaluation of procurement procedures and the results of contract performance regarding their compliance with the requirements of the bill.
4. Address and direct materials related to monitoring the results of the activity to the public authorities authorized for control of customer activity, with offers to conduct checks on customers, and acceptance of the appropriate measures.
5. Hold events (public hearings, discussions) concerning the activity.
6. Carry out other activities according to federal law and other regulations of the Russian Federation.

## Current Achievements, Problems, and Solutions

The following features of the public procurement system in the Russian Federation are common:

1. *Unified information system*: The UIS is used for placement of information about orders. Over the last 10 years, the system of government procurement in the Russian Federation has been significantly updated and modernized. This centralized resource (which has no analogs in other countries), the official website of the Russian Federation for placement of information about purchases of goods, works, and services, was created on 1 January 2016. In 2016, nearly 3,300,000 notices for a total amount of 6.5 trillion rubles were placed on the portal of the UIS for the contract system in the Russian Federation. The website is the fully fledged instrument of the market in all territories of the country and allows all participants, irrespective of location, to take part in the competition for a state or municipal contract.
2. *Electronic platforms*: Development of the state ordering system since 2005 has been implemented using the model of a private partnership between the state and a supplier. Operators of electronic platforms organize methods such as electronic auctions, which allow participation in the auction without uniform paper documents. All infrastructure is created by the platform operators, without investment from the state. This has allowed savings of 8–10 billion rubles, which has been spent on the transition to electronic procurement.
3. *Procedural control*: Over the last 10 years, a system of procedural control for the state ordering system has been created that has no analogs regarding speed and working capacity. Any applicant can appeal against violations of the competition at all stages in the cycle of procurement. The number of such complaints is estimated to be tens of thousands a year (53,000 in 2013 and 62,000 in 2015). Furthermore, many hundreds of purchases are cancelled because correct documentation is not provided by the supplier or the commission illegally rejected a more competitive application (in 2015, 13,000 complaints were satisfied). The conveyor of complaints is available and quick – the established period of 10 days for analysis of the complaint is usually achieved.

This ambitious service model of the state ordering system has been in place since 2014. Before that, regulation of the sphere of government procurement was carried out according to the Federal Law of 21 July 2005, No. 94-FZ "About placing orders for delivery of goods, performance of work, rendering services for the state and municipal needs". By 2013, it had become obvious that the

potential of Federal Law No. 94-FZ was exhausted. With its acceptance in 2006, the basis of the system of government and municipal procurement was created; however, after years of corruption and fraud in purchases, the problem had spread to the stage of order placement, where there were no standard regulations for planning of purchases and performance of contracts.

Within the approved ideology, the state ordering system is perceived as one of the services providing implementation of state programs. The service ideology emphasizes regulation of the full procurement cycle to ensure that state needs are filled – from planning of purchases to the final result, through monitoring and control of the results of performance of contracts, including public control.

### Problems of the State Ordering System in Russia

There are three main problems associated with the Russian procurement system – credibility, corruption, and cost. These are discussed next in more detail.

There is a low level of credibility in the state procurement market, resulting in low indicators of activity. The low level of credibility in the state procurement market creates a self-fulfilling prophecy – low trust leads to a small number of participants in an auction and a low level of competition. This, in turn, convinces players of the poor quality of the market and the hopelessness of participation in the auction. Confirmation of the mistrust of the market for state and municipal orders is given by the extremely low average number of participants in an auction. For decades, there have been 2–2.5 participants per auction. It should be noted that sometimes participants submit two applications at once because if there is only one application, it is necessary to undergo additional coordination in FACE (Federal Antimonopoly committee). Therefore, the real number of participants is even less.

Corruption levels in the state procurement system remain high. The electronic auctions cannot transform the state ordering system into a mechanism whereby the winning offer is the most favorable for the state. Purchases continue to be corrupted by officials for whom purchase orders are a source of enrichment and not a means of achieving the tasks of state programs. More than 40% of interviewed businessmen considered the state procurement system to be very corrupt. Defeat by the corruption of the state system also means that it is impossible to raise the level of quality of delivered goods, works, and services. Therefore, roads continue to be constructed during bad weather (during rain or snow), and school students continue to be fed rotten fruit and vegetables.

Customer expenses have grown significantly. Research at the Higher School of Economics showed that most (84.2%) responding customers specified that implementation of purchases according to the new rules of 2014 demands large expenses. Most respondents noted noticeable (twofold and more) growth in labor costs. These expenses were primarily connected with the need to prepare a larger volume of documents at the planning stage and to justify prices. Additional costs also arose from interaction with regulators (for example, for coordination of purchases as the only software supplier) and from cancelled competitive procedures.

## Directions of Reform

### Debureaucratization

Credible business providers for the public procurement market are discouraged by bureaucratic systems such as a 200-page document of rules for ensuring performance of purchase contracts, the rigid terms of the documents (preparation of the application usually takes three attempts), and the impossibility of making changes to a submitted application. Moreover, the system deprives the conscientious customer of the opportunity to select the best proposal from a reliable supplier.

The quantity of paperwork that must be collected for participation in the bidding is constantly rising. It is necessary to simplify significantly the paperwork needed for small and medium businesses to participate in the bidding procedures, to limit the possibility of corrupt customers imposing overestimated requirements on participants, and to create the opportunity to provide

necessary confirmation not at the stage of application submission, but at the signing stage or even during performance of the contract.

### Electronic Shop

In quantitative expression, small purchases dominate the state ordering system. Instead of a simple purchase, customers are forced to carry out difficult procedures that can take weeks to complete. For simple purchases of standard goods (according to a separate list), the electronic shop can be used. This procedure involves placement of a notice on the electronic platform regarding an order, with instructions on the category of goods (work, services), volume indicators, initial (maximum) price, and required delivery time (rendering, performance). To make small purchases of up to 10,000–20,000 rubles, contract managing directors have the opportunity to use debit cards from widespread payment service providers.

### Personalization of Responsibility

Long-term reform in the state in Russia has been based on a paradigm of detailed regulation of processes. The culture of bribery was proposed "to be taken in pincers" by controlling both the supply and demand sides: on the one hand, by locking the official effectiveness indicators and, on the other hand, by regulating an official's work. Administrative regulations on rendering of services and current legislation on the contract system are obvious evidence of the fiasco of this ideology.

The first step in improving the procurement system has been taken by including the contract service and the contract managing director. However, the potential of contract managing directors in a government procurement system is underused. People who every day have the opportunity to influence decision-making at the price of several billion rubles have to work in a system of restrictions and encouragement. Restrictions and encouragement need to be more rigid and more powerful. In exchange for stricter requirements regarding conflicts of interest, the use of polygraphs, and disclosure of data on income and expenses, contract managing directors need encouragement. This is normal corporate practice. Such an approach can allow the state to enter the market for highly skilled specialists, involve chief purchasing officers with wide corporate experience, and, above all, avoid employing those with slippery or negative stories in their track record. For large customers, a non-departmental council should be engaged in the selection of contract officers.

Reputation mechanisms are not only useful for the personnel structure of contract services, but also for departments in general. Following the results of periodic assessment of indicators of work for departmental contract systems (competition level, economy, effectiveness of purchases), the worst departments lose the right to use difficult and, therefore, corruptogenic methods of auction, or must completely pass their purchasing function to the centralized service purchasing agency (for reference, see the experience of the UK Crown Commercial Service).

Control is required, not only of procedures, but also of results. Russia already has experience of creating an effective system of procedural control in the sphere of purchases. A similar system has to be created for control of the results of purchases. Such functions are now fixed and bodies of financial control exist, but control is not carried out by anybody. Any citizen, as user of the result of performance of a state or municipal contract, has to acquire the right to make a complaint about low quality service (a poor quality road, badly repaired playground, etc.), and the authorized body needs the power to quickly consider the complaint and make a decision, including following the results of a Double check.

## Conclusions

The main issues in public procurement are the low level of credibility (and, as a result, low participation) and the high level of corruption. As reform measures, it is proposed to focus on measures to reduce bureaucracy. It is necessary to simplify significantly the process for small and medium businesses to participate in bidding for a procurement contract. Introduction of the electronic shop will also greatly simplify the procurement process. A further important measure is personalization of responsibility, meaning that restrictions

and encouragement for public procurement staff must be more rigid and more powerful. Control of both procedures and results (i.e., delivery of goods and services) is also an essential step on the way to reform of the Russian public procurement system.

# Public Procurement in Uganda

Pius Gumisiriza
School of Public Policy and Governance, Management Institute, Kampala, Uganda

## Synonyms

Decentralization; Public procurement; Service delivery

## Definition

Public procurement is the means by which governments acquire goods, services, and contracting of construction works using public resources.

## Introduction

Public procurement is a strategically and politically influential activity that governments can use to stimulate economic activities, protect national industries from foreign competition, develop local content, improve the competitiveness of certain industrial sectors, reduce inequality and poverty, and promote efficiency, effectiveness, fairness, and value for money (Thai 2009; Uyarra and Flanagan 2009; Arrowsmith 2011). In Uganda, public procurement is equally an important and influential activity because it accounts for over 70% of public spending and the National Development Plan 2015–2020 envisages that the amount of money to be spent on transport, energy, housing, and essential supplies is expected to increase tremendously to over US$ 30 billion by 2040 as the country tries to achieve its vision of prosperity (NDP II 2015).

## International Public Procurement Regulation Instruments

Many international and regional bodies have emphasized the need for establishment of a proper, accountable, transparent, and non-discriminatory and a corruption-free public procurement system among member states. For instance, Article 9 of the United Nations Convention against Corruption calls upon member states to take the necessary steps to establish appropriate systems of procurement based on transparency, competition, and objective criteria in decision-making that are effective in preventing corruption. The convention articulates specific issues which the public procurement system should address including public distribution of information relating to procurement procedures and contracts/tenders, giving tenderers enough time to respond to the bid invitations; establishment of appropriate procedures and conditions for participation, using objective and predetermined criteria for public procurement decisions to facilitate the subsequent verification of the correct application of the rules or procedures; establishment of an effective mechanism of domestic review; and regulation of personnel responsible for procurement so that they pursue ethical, fair, and impartial procurement procedures in application of legislation, tendering rules during procurement. This is alluded to by the African Union Convention on Preventing and Combating Corruption, Article 11(2), that calls for parties to establish mechanisms to encourage participation by the private sector in the fight against unfair competition and

respect of the tender procedures and property rights, while Article 11(3) calls for state parties to adopt measures to prevent companies from paying bribes to win tenders. Furthermore, the United Nations Commission on International Trade Law established the Model Law on Public Procurement that aimed at achieving value for money and avoiding abuses in the procurement and has been used by various governments to shape national public procurement legislation (UNODC 2013).

## Public Procurement Regulation Instruments in Uganda

Before the promulgation of the 1995 Uganda Constitution, the 1977 Public Finance Regulations under the Public Finance Act of 1964 governed public procurement in the country. Following the new Constitution in 1995 and the implementation of structural adjustment programs, the NRM government with the support from development partners initiated reforms and established laws governing the public procurement and disposal sector in a way that takes into consideration the value for money, transparency, and accountability (Karyeija 2012; Basheka and Bisangabasaija 2010). These laws include the Public Procurement and Disposal of Public Assets Act of 2003; the Public Procurement and Disposal of Public Assets Regulations of 2003; the local Governments Public Procurement and Disposal Regulations of 2006; the Local Governments Act of 1997 as amended; the Local Governments Financial and Accounting Regulations of 1998; the local government (Public Procurement and Disposal of Public Assets) guidelines of 2008; and international procurement laws, e.g., World Bank Guidelines (World Bank 2004). The Ministry of Finance, Planning and Economic Development sets the procurement policy and oversees the procurement process across the government. The Public Procurement and Disposal of Public Assets Authority (PPDA) sets standards and regulates procurement and disposal activities of PDEs, which are government ministries, districts and municipal local government authorities, and other public bodies engaged in the procurement and disposal activities. The procuring and disposing entities (PDEs) implement the PPDA Act. Each PDE includes an accounting officer (AO), a contracts committee (CC), a procurement disposal unit (PDU), user departments (US), and an evaluation committee (EC). The accounting officer in the municipalities is the town clerk, while the DLGs' chief administrative officer (CAO) is appointed by the Public Service Commission. The AO ensures that the DLG establishes an appropriately staffed procurement and disposal unit charged with managing of all public procurements and disposal activities except adjudication and the award of contracts. The AO also nominates members of the contracts committee who are approved by the Secretary to the Treasury. The user department is any department, division, branch, or section of the procuring and disposing entity, including any project unit working under the authority of the procuring and disposing entity. The main areas of responsibility are preparing annual procurement plans, initiating procurement and disposal requirements, and defining needs; providing technical inputs to the procurement and disposal process; undertaking delegated micro procurements; and managing contracts once placed. The contracts committee is a team of individuals appointed by the authorized officer to oversee the procurement and disposal of assets on behalf of the procuring agency. The contracts committee sends a representative to attend pre-bid meetings and witness bid closure and opening. However, their main responsibility is to approve or reject contract award decisions or recommendations from the procurement and disposal unit throughout the procurement or disposal process and ensure that procurement and disposal activities are conducted in compliance with the PPDA Act and Regulations. The evaluation committee (EC) whose membership is recommended by the procurement disposal unit and approved by the contracts committee evaluates the bids submitted after which it forwards recommendations to the AO for decision-making. Providers, suppliers, contractors, and consultants participate in public procurement and disposal proceedings. Procurement disposal units manage procurement

and disposal activities working in conjunction with user departments and seeking approval of contracts committee where appropriate (PPDA 2015).

## Stages in Public Procurement in Uganda

Public procurement in Uganda both at the center and local government level is guided and regulated by the Public Procurement and Disposal of Asset Act, 2003. The process of public procurement in Uganda is very complex with over 15 stages involved as explained hereafter.

### Stage 1: Planning and Budgeting

Procurement planning allows procurement and disposal entities (PDEs) to aggregate requirements into larger contracts, gain economies of scale, avoid emergency procurements, and spread the procurement workload according to available resources. The annual procurement plan embedded in the output-based budgeting tool is submitted to the Permanent Secretary/Secretary to the Treasury, and it is mandatory that the plan is displayed on the notice board and PPDA website as provided by Part IV, Section 58 of the Act, PPDA Regulations 2014, Regulations 3–7 (PPDA 2015: 17).

### Stages 2: Initiating Procurement Requirements

It is essential that for any procurement process to commence, there should be a signed authorization and approval from the authorized official that funds will be available for the purchase of items provided in the procurement plan. Procurement requirements must be initiated using Form 5, which requires signature to confirm the availability of funds and give approval for the procurement to proceed as provided for in Part IV, Section 59 of the Act, PPDA Regulations 2014, Regulation 3–4 (PPDA 2015: 7).

### Stage 3: Preparation of Specifications

It is at this stage that PDEs are required to specify in details what is supposed to be procured, for instance, specifications for supplies, schedule of works, and terms of reference for consultancy (PPDA 2015: 7).

### Stages 4: Selecting a Procurement Method

Several methods of public procurement and the different conditions of use are provided here depending on the nature and value of works, services, and supplies to be provided as indicated in Section VI, Section 79 of the Act, PPDA and Regulation 2014, Regulation 6(4). The methods include open domestic bidding, which is open to all bidders following public advertising and involves maximum competition; open international bidding, which is similar to open domestic bidding, except that a special effort is made to attract foreign bidders; and restricted domestic bidding, which is similar to open domestic bidding, except that there is no advertising, so bidders are invited from short lists. It may be used where only a limited number of providers exist, in emergency situations and for procurement under a certain value threshold; restricted international bidding is the same as restricted domestic bidding, except that short list includes foreign bidders. Quotations and proposals procurement is a simplified method, with quicker and simpler procedures and documentation, intended primarily for low value procurement, which is under a certain value threshold. It may also be used in emergency situations: micro-procurement – quick and simple method for very low value procurement – which allows items to be purchased directly from a single provider, without competition and with minimal documentation, where the value is under a certain threshold. Direct procurement is a method, which allows items to be purchased directly from a single provider without competition, regardless of their value, in exceptional circumstances only. These circumstances include emergency situations, the items only being available from a single provider and contract extensions within certain limits. Force account mechanism is undertaking the works of a procuring and disposing entity using the personnel and equipment of the entity or another entity. The procuring and disposing entity determines that the direct, indirect, and overhead costs to be incurred are less than would be incurred if a

contractor executed the assignment. However, this condition does not apply where there is an emergency situation or where no contractor is willing to execute the assignment (PPDA 2015: 7).

### Stage 5: Drafting Solicitation Documents

All solicitation documents must be drafted using one of the standard solicitation documents issued by the authority. The standard documents include documents for high value or complex requirements and request for quotations and purchase order documents for simple, low-value requirements. Different documents are provided for works, services, and non-consultancy services. The standard solicitation documents are listed on the authority website. It is important to select the most appropriate document before drafting begins. Before issue, the contracts committee authorizes the solicitation documents. The standard bidding document has sections which must be used without changes, e.g., the instruction to bidders, which may only be modified through special conditions of contract. Solicitation documents must contain a statement of requirements, which clearly defines what is to be purchased by means of specifications, terms of reference, bills of quantities, drawings, etc. Statements of requirements must include common specification standards issued by the international recognized trade associations and professional bodies in the appropriate fields (PPDA 2015: 9).

### Stage 6: Invitation for Bids

The method for selecting bidders varies according to the procurement method used (*Part V, Section 51, 64, 70 and 71, Part VI, Section 80–86 of the Act; PPDA Regulations 2014, Regulations 12–17).* For open bidding, bidders are selected either by publication of a bid notice to offer the opportunity to all interested bidders or through a prequalification where a short list of prequalified bidders is provided. For direct procurement, this allows items to be purchased directly from a single provider without competition, regardless of their value, in exceptional circumstances only. These circumstances include emergency situations, the items only being available from a single provider, and contract extensions within the limits with a maximum of 25%. For micro procurement, the item is purchased directly from a single provider, and no written bid is required. A minimum of three quotations must be sourced, and details on how to invite bids and the minimum bidding periods for various methods of procurement are provided (PPDA 2015: 9).

### Stage 7: Submission and Receipt of Bids

The procuring and disposing entity may invite bids to be submitted (*Part V, Section 67 of the Act; PPDA Regulations 2014, Regulation 56*). The appropriate method will depend on the type of procurement and the evaluation methodology used. Correct management of the receipt of bids is essential to a transparent procurement process, as it ensures that no late bids are accepted. There are two methods of receiving bids, and the choice is at the discretion of the procuring and disposing entity: bids can be received in person by the staff of the procuring and disposing entity, with the staff issuing receipts for bids, marked with the date and time of the receipt. Bids must be kept in a secure place until the time for the public bid opening; bids can be received in a bid box; bidders are responsible for placing their bid in the box, and staff seals the box at the date and time of the deadline. A procuring and disposing entity may choose to register bids and issue receipts before they are placed in the bid box (PPDA 2015: 11).

### Stage 8: Public Bid Opening

All methods of procurement under open bidding and restricted bidding methods must have a public bid opening (*Part V, Section 69 of the Act; PPDA, Regulations 2014, Regulations 62–65*). The procuring and disposing entity must inform all bidders of the date, time, and location of the opening to enable them to attend. At least a member of the contracts committee or a person nominated by the user department is required to witness the public bid opening. It is important that all staff involved in the bid agree on their respective responsibilities prior to the opening, to ensure that it proceeds smoothly. For micro procurement and request for proposals/quotations, closed bid opening is

allowed. The bidders are not invited to attend. The information to be read out at the public opening must also be agreed on in advance and must be in accordance with the solicitation document (PPDA 2015: 12).

### Stage 9: Evaluation

Evaluation is the process by which the best evaluated bidder is selected for award of contract from among all the bids received. The evaluation process has to be concluded within 20 working days for supplies and non-consultancy services and 40 working days for works from the date of opening bids. A team of at least three members of staff, who are approved by the contracts committee, conducts evaluations (*Part V, Section 71 of the Act; PPDA Regulations 2014, Regulation 5*). The evaluation consists of three stages: preliminary examination which is a brief assessment of whether each bidder is eligible as per the requirements of the solicitation document; detailed evaluation that determines whether bids are substantially responsive to the commercial and technical requirements of the solicitation document, assessing its technical quality, either by comparison to the specifications in the solicitation document or by awarding merit points; and financial comparison that determines the evaluated price of each bid, following the correction of any errors or inclusion of any necessary adjustments and determines the best evaluated bid, which may be the lowest price, highest quality, or best point score, depending on the evaluation methodology. Depending on circumstances, an appropriate evaluation methodology should be used, and the methodologies may include quality- and cost-based selection which considers both the technical quality and the cost of each bid, with the relative weighting of technical and cost elements decided in advance. Quality-based selection focuses on the quality only, using merit points to determine the best quality technical bid. The best quality bid is the best evaluated bid, regardless of price, and only the financial bid of the best technical scoring bidder is considered. Fixed budget selection is used to obtain the highest-quality bid which is within the procuring and disposing entity's budget. The procuring and disposing entity uses the least cost selection to obtain the lowest-priced bid which meets the technical standard required. Technical compliance selection is also used to obtain the lowest-priced bid which meets the technical standard required by the procuring and disposing entity (PPDA 2015: 12).

### Stage 10: Award Decision

This involves a review of the evaluation committee report and results of any post qualification or negotiations to form a basis for award of the contract. However, any decision by the contracts committee to authorize the award of a contract does not constitute a binding contract as indicated in Part V, Section 76 (1) of the Act, PPDA (Contracts) Regulations 2014, Regulation 11 (PPDA 2015: 14).

### Stage 11: Notice of Best Evaluated Bidder

This follows the award decision; the PDE displays a notice of best evaluated bidder to PDE entity notice board and PPDA website for a certain period of time depending on the procurement method. The notice must also be sent to all bidder's writing. Under open restricted bidding, the notice must be published for a minimum of 10 working days, while for quotations and proposal procurement or direct procurement, it must be published for a minimum of 5 working days as indicated in Part V Section 76(2) a & 76 (4) of the Act, PPDA (Rules and Methods for Procurement of Supplies, Works and Non-Consultancy Services) Regulations 2014, Regulation 16(1) (PPDA 2015: 14).

### Stage 12: Awarding a Contract

This follows a decision by the contracts committee to award the contract after the AO confirmation that the contract price is not higher than the market price and the PP is not subject to any administrative review. In instances of big procurements, this is done when relevant agencies like solicitor general have made the necessary approvals (PPDA 2015: 14).

### Stage 13: Contract Signing

The laws provide for the signing of the contract of the contract by the AO on the behalf of the PDE.

The contract should spell out clearly the supervisor, the roles, as well as a complete procurement plan (PPDA 2015: 14).

### Stage 14: Contracts Management Phase

It involves ensuring that the contractor or supplier performs in accordance to the terms and conditions of the contract, while the PDE meets its obligation spelt in the contract. Primarily the user department does this though the external supervisor may be appointed especially for bigger projects (PPDA 2015: 14).

### Stage 15: Performance Review

This establishes whether public procurement was compliant to the quantity, quality, and delivery period provided for in the contract (PPDA 2015: 14). In order to encourage transparency, accountability, competition, professionalism, good business ethics, and nondiscrimination among suppliers and other procurement stakeholders, the PPDA Act 2003 was amended to expand the definition of accounting officers beyond those appointed by the Secretary to the Treasury to include heads of statutory bodies or government enterprises; members of PDEs are prohibited from entering into contracts with their entities and are required to disclose any conflict of interest at key stages. The amended law now provides for the Ministry of Defense and national security organs to appoint contracts committees approved by the Secretary to the Treasury to handle procurement and disposal of classified items by the respective accounting officers. There is also a provision for the establishment of a procurement tribunal intended to strengthen the administrative review process and guarantee public confidence in the procurement process among other amendments (see Uganda Debt Network 2013).

## Public Procurement Challenges in Uganda

Despite of the government's efforts in instituting an enabling legal and institutional framework governing public procurement, the entire process and practices still face massive challenges including procurement corruption which is estimated over US$ 300 million per year, non-adherence to prescribed procurement practices, influence peddling and political interference in the procurement processes both at the central and local government levels in small and huge contacts, failure or delays in delivering of executed contracts, poor documentation and record keeping, limited awareness of procurement laws and procedures by key stakeholders, limited citizen participation, and involvement in procurement processes including planning, award, implementation, and closure. Shoddy work from incompetent contractors who get contracts through corruption, influence peddling, poor supervision, and monitoring by mandated officials is also a huge public procurement challenge in Uganda. Poor consultation, inadequate planning, and failure to put serious attention on the needs and priorities of beneficiaries who are the key target of procured goods, services, and works have resulted in the lack of trust, ownership of the provided goods and services by the beneficiaries, and consequent wastage of public resources (see UDN 2013; Bukenya and Muhumuza 2017).

## Recommendations

Because of the complex, intertwined, and ever-changing challenges facing public procurement, this entry recommends that immediate, robust, and systematic measures should be taken including establishing an effective agency that can handle all complex government procurements especially those involving tens of millions of dollars, blacklisting and possibly banning companies that flout procurement laws; the government should strengthen procurement laws especially to target and punish public officials who engage in collusive public procurement corruption, for instance, government officials implicated in procurement-related malpractices should be barred from holding public office in the public interest, allowing for the recovery of procurement money lost in corruption through confiscation of properties or assets of proven culprits; the

government through the directorate of public prosecution and inspectorate of government should prosecute and punish all or any individual implicated in corrupt dealings without fear or favor and endeavor to end the current selective prosecution that allows people in top positions of the government to engage in corruption scot-free. President Museveni must walk the talk on corruption and desist from continuous interfering in the procurement projects especially megaprojects because it has been proven time and again that his interference has in most cases resulted in the loss of public money (Bukenya and Muhumuza 2017). Proceedings during contract awarding should be made public so as to promote openness and greater transparency during pubic procurement. The government should establish a database of service providers detailing their capacity, current workload, past records concerning delivery of work, involvement in corruption, work delays, and non-execution of works. Government ministries, departments, agencies, and accounting officers should enforce a rigorous monitoring and evaluation system including spot monitoring checks to counter poor supervising by responsible officials (Uganda Debt Network 2013).

## Conclusion

In conclusion, given the complexity of each of these procurement processes, huge amounts of money involved, the different actors, and the rampant corruption in Uganda, the government should in addition to the measure already in place enhance the use of private consultancy firms to carry out bidding and tendering process and encourage the use of open and free bidding process; roll out the use of e-procurement and other platforms to improve procurement outcomes; strengthen the use of suspended providers list; promote local industry participation in government tenders; strengthen contract management and performance; enhance the capacity of all actors involved in public procurement; and promote dissemination of data and information on public procurement.

# Public Procurement Trends in Public Administration Research: 1972–2017

Evelyn Trammell[1], Sawsan Abutabenjeh[2] and Ana-Maria Dimand[1]
[1]Florida International University, Miami, FL, USA
[2]Mississippi State University, Starkville, MS, USA

## Synonyms

Contracting; Procurement; Purchasing

## Definitions

Public procurement: activities involved in the management of government expenditures for goods and services related to day to day operations.

## Introduction

The purpose of this entry is to provide an overview of public procurement history, practices, and trends. History and practices are outlined in the context of the United States while procurement trends are presented incorporating the global view. The first section explains the nexus between public procurement and public management. The second section outlines how public procurement manifests in public administration research, and the final section details the trends in procurement research from 1972 to 2017.

## What Is Public Procurement?

Public procurement, which is an essential function at all levels of government, entails various activities to obtain quality goods and services at the lowest cost conducted in support of policy objectives and other activities (Prier and McCue 2009). Governments use several tools for acquisitions such as Request for Proposals, Invitation to Bid, Request for Quotes, Request for Qualifications, and Request for Information. Although there is discretion in how procurement is carried out, there are legal, professional, and ethical codes that guide procurement operations (e.g., Federal Acquisition Regulation, American Bar Association, NIGP: The Institute for Public Procurement, National Association of State Procurement Officials).

## Public Procurement and Public Management

Public procurement is one of the most important functions of public management. In the United States, procurement has been used to address government inefficiencies for decades. This includes, for example, cost reduction by outsourcing for the provision of goods and services and mandating fair treatment through contract stipulations. Contracting out became an important emphasis during the Reagan administration and the New Public Management movement in the United States. Procurement reforms focused on reducing government expenditures, increasing competition, and improving efficiency.

Following the prime years of the New Public Management movement, the focus in procurement shifted toward governance and included network management, collaboration, and cooperation between various stakeholders (i.e., businesses, nonprofit agencies, government organizations). An example of this relationship is evident in public-private partnerships which are multiyear contracts for a public service operated by a private entity. Reasons for public-private partnerships include risk sharing, overcoming budget constraints, project effectiveness, and innovation. An

important element of public management with these arrangements is contract administration and oversight.

Most recently, public procurement practices have shifted from a model that focuses on lowest cost purchasing to one with a focus on sustainability. While lowest cost remains important in this model, sustainable procurement promotes government spending in a socially, economically, and environmentally responsible manner. Sustainable procurement includes practices such as buying and building with environmentally friendly products, mandating living wages to be paid to parties of government contracts, and contracting with traditionally disadvantaged groups such as women-owned businesses, minority owned businesses, local owned business (Abutabenjeh et al. 2018).

Technology plays an important role in government contracting and it has impacted how public procurement is conducted globally. E-procurement, digitalization, and innovation are important tools to decrease waste, streamline operations, reduce corruption, and minimize administrative burdens.

Public procurement has broadened its scope and reach from aiming for lowest cost to governance, collaboration, sustainability, and digitalization. This has implications for how governments deliver public services and protect the public interest. These developments demonstrate the importance of public procurement for public management.

## Public Procurement and Public Administration Scholarship

Research within the procurement field spans several areas. Thai (2001) conducted a content analysis of book chapters related to procurement. Results indicate that older literature centers on the procurement process, while more recently the focus has turned to legal constraints, regulations, and social equity within the procurement environment. In a review of procurement research in *Journal of Purchasing & Supply Management*, from 1994 to 2009, Wynstra (2010) examines the content of 351 articles to determine the most prevalent topics in the field. This analysis finds that organizational structure, ethics and socio-economic issues, strategic procurement, supply chain management, supplier relations relating to communication, trust and supplier development, and sourcing strategies are the most researched procurement topics. Furthermore, the majority of these topics utilize qualitative methods and the samples used are highly interdisciplinary. Building on Wynstra's (2010) study, Lange et al. (2014) examined 378 articles published in top ten peer-reviewed journals to identify predominant study characteristics. Findings reveal an increased interest in public procurement research across various disciplines. They found that the most researched topics in their sample of articles from 1997 to 2012 include public-private partnerships, contracting out, and selection. The majority of their sample was in the context of the United States and United Kingdom. The local level of government is the most researched level. The trend in methodology reflects that quantitative analysis was used more in early studies, but quantitative and qualitative analyses are both prevalent in recent studies. Similar to Wynstra (2010) and Lange et al. (2014), Flynn and Davis (2014) reviewed procurement research from 2001 to 2013 in the *Journal of Public Procurement.* Their primary interest was to identify the theories most utilized in procurement research. Their final sample consisted of 172 articles. Flynn and Davis (2014) found that only 29% of the articles in their sample use a consolidated theory. Economic theories are the most prevalent. Other theories used include principal-agent, transaction costs, systems, institutional and organizational behavior theories. This research is conducted mainly in the context of the United States and Europe with a focus on organizational level versus individual level behavior.

## Public Procurement Trends in Public Administration Research

Most recently, Trammell et al. (2019) conducted a systematic review of procurement topics in public administration research. A systematic review, which is appropriate for synthesizing large amounts of content, and helps to identify themes, gaps in literature, and similarities and differences

among scholarship included (Bishu and Alkadry 2017). The steps in the systematic review are as follows: (1) search and identify the journals using SCImago Journal & Country Rank and Web of Science journal databases; (2) identify and collect articles from the 15 top ranked journals identified through these databases; (3) apply inclusion and exclusion criteria to determine the final sample of articles which include 263 articles from the following journals: *Journal of Public Administration Research and Theory*, *Journal of European Public Policy, Public Administration Review*, *International Public Management Journal*, *Public Administration*, *Governance*, *Journal of Policy Analysis and Management, Policy Studies Journal, Regulation and Governance, American Review of Public Administration, Journal of Social Policy, Policy and Politics, Review of Public Personnel Administration, Journal of Public Policy, Social Policy and Administration*; (4) describe the content of articles, cross code, synthesize findings, and provide conclusions of the systematic review.

The importance of public procurement as a subfield of study in public administration is established by identifying relevant scholarship and its main contributions to the broader field of public administration. Towards this end, they provide an overview of topics over time, theories used, countries studied, methodologies employed, level of government, and the trend of procurement research from 1972 to 2017 is provided. The framework utilized to group main findings is built from previous scholarship on the topic (Thai 2001; Ya Ni and Bretschneider 2007; Flynn and Davis 2014).

The main themes identified by the systematic review include individual characteristics and motivations toward contracting, procurement as an organizational level phenomenon, legal issues, ethics and social/economic and environmental issues, determinants of contracting out. Subthemes within the individual characteristics and motivations towards contracting category includes public buyers' attitudes towards contracting, motivations of public sector buyers, and the public's attitude towards contracting. Subthemes within procurement as an organizational level phenomenon group includes technology procurement interface, contract administration, risk management, performance management, suppliers, contracting out/outsourcing, organization/management of procurement function, costing and pricing models, procurement competition design, tender evaluation systems, sector specific procurement strategies, logistics (the process), collaboration design, and role of procurement in the organizational structure as a function. The legal issues theme includes regulations/policies. The ethics, social/economic, and environmental issues group includes articles focused on social, economic, environmental issues, contracting and public values, ethics and accountability, and sustainability. Lastly, the determinants of the contracting out group includes individual, organizational, and environment factors.

Trends demonstrate that procurement research has been increasing over time with the most research being conducted from 2007 to 2017 and that the majority of articles reviewed do not inform their studies with any theoretical foundation. Of those studies using a theoretical basis for their research, the most prevalent theories are economic theories, transaction cost theory, principal agent theory, public choice theory, and New Public Management. Theories utilized less frequently include representative bureaucracy, agency theory, and institutional theory. Fifty-four percent of studies used qualitative methodology. Thirty-eight percent of studies in this sample utilized quantitative methodology. Only 7% used mixed methodology in their research design (Trammell et al. 2019).

The authors compiled a list of keywords relevant to procurement studies and practice. They searched articles using these keywords to establish the most common terms in procurement research. The authors find that the most common keywords in procurement scholarship are: contracting, privatization, contracting out, procurement, public-private partnership, and contract management. The keywords utilized less are: outsourcing, purchasing, acquisition, sourcing, and supply chain.

In consensus with previous literature, the main focus of procurement research in public

administration is on the organizational level of procurement (51% of articles in the sample). Performance management, collaboration design, organization/management of the procurement function, and procurement competition design are the prevalent subthemes within this group. Determinants of contracting out comprised 17% of articles in the sample.

Finally, the United States and European context are most popular in procurement research. This is consistent with previous studies (e.g., Flynn and Davis 2014). Furthermore, the local level is found to be the most prevalent level of government studied in procurement research found in public administration journals. This is similar to the findings of Lange et al. (2014).

## Conclusion

This entry depicts the concept of public procurement by presenting the history, practices, and trends in public administration. Public procurement research has been increasing in popularity and importance, particularly as a subfield of public administration. However, the topic is at the center of only 1% of the studies in Trammell et al.'s (2019) sample. In order to inform practitioners and advance theory, researchers should expand their queries beyond analyzing procurement decision making processes and issues related to performance management. More attention could be directed towards procurement processes and polices as they relate to contract administration, supplier selection, technology, strategy, price models, sustainability, collaboration as well as on the individuals involved in this activity.

This entry outlines pathways to expand current public procurement scholarship. Articles employing a mixed-method design lag behind papers that utilize either a quantitative or a qualitative approach to conducting research. Therefore, this approach could be instrumental in developing a deeper understanding of public procurement practices and the behavior of the parties involved in the process. In addition, the field could benefit from exploring other theories beyond the traditional economic frameworks that have been at the center of public procurement research to date.

## Introduction

Public procurement is one of the most important government economic activities (Thai 2001), considering the values involved in this activity. In 2015, Organisation for Economic Co-operation and Development (or OECD) member countries purchased an average of 13.8% of their gross domestic product.

However, the importance of public procurement is not limited to the amount of resources involved in public contracting, nor to the number of procurement processes performed. Public procurement has fulfilled different roles, from the operationalization of the supply of goods and services to state activities, to the implementation of strategic objectives of governments, which go beyond the economic objectives (value for money) by including social objectives and (public value).

In this way, a multiplicity of arrangements is created in public purchases, with a view to making more efficient purchases. The search for such efficiency is an arduous task, given the challenges the system faces related to the structure of the market and the political and legal environments in which buyers and sellers are involved (Thai 2004; Carpineti et al. 2006).

Broadening the objectives pursued by public procurement systems increases the complexity of the management of these systems since the success of their activities is seen in a multidimensional way. Thus, the decisions involved in this whole system do not rest on the "make it or buy it" debate, which Brown and Potoski (2003) argue focuses on the production or transaction costs involved in the different stages of the system.

## Framework

The main concern of a public procurement system is to achieve the best possible result. However, considering the multiple objectives to be pursued by governments with government procurement, there are several ways of analyzing the performance of public procurement systems.

The public procurement framework involves several stages and actors that are affected by internal and external factors of the contracting organization. The analysis of public procurement, in general, acknowledges the existence of several tensions involving stakeholders. Analyses of public procurement generally recognize the existence of various tensions involving stakeholders. Tension between public expectations for transparency and accountability on the one hand and the search for effectiveness and efficiency of the system on the other hand is one example (Schapper et al. 2006).

One of the most commonly used ways for government to balance these tensions is a so-called reverse auction: a market institution with pricing rules based on the participants' proposals (McAfee and McMillan 1987). These auctions have several benefits, and competition is the most important (Tadelis and Bajari 2006). In this environment, competitors approach their prices from actual production costs to achieve bidding. Increased competition can contribute to reducing corruption, as it increases the costs of coordinating potential collusion between suppliers (Lamothe 2015).

These auctions do not guarantee by itself that the public purchase will generate the best result, since, among other factors, the result can be affected by the costs incurred to plan, adapt, monitor, and complete the task. These costs may make the process unattractive from an economic point of view (Tadelis and Bajari 2006). However, the use of information and communication technology tools has contributed to the considerable reduction of these costs.

These costs occur because of the need to minimize opportunistic behavior, specifically of the agents, so the contractor must incur transaction costs and specify performance measures, seeking to write more detailed contracts to allow the monitoring of suppliers (Brown et al. 2006) avoiding so-called agency problems.

This need to create mechanisms and specify contracts arises from a further tension involving the distinct interests between the principal (contracting) and agent (supplier). As both seek to maximize their utility and the rationality of

both is limited, such problems may arise and compromise the achievement of the objectives of the principal.

Ignoring the above-mentioned tensions and the prevalence of the presented problems can compromise the strategies presented by the governments to extend value creation, (Erridge and Mcllroy 2002; Reis 2016).

However, the objectives of public procurement are not restricted to obtaining value for money and in some situations seek to obtain public value (Erridge 2007), demonstrating the strategic potential of public procurement to meet state objectives, as well as the supply of goods and services for state action.

Briefly, the analyses that involve public procurement should consider the possibility of multiple objectives, acting as a strategic instrument that contributes to the achievement of the State's objectives. Thus, systems are not designed for the exclusive purpose of extending the value for Money, seeking in many cases to generate public value. Thus, the debate about the purchases as well as the analysis of it performance cannot be summed up only the economy measures.

## The Brazilian Public Procurement System

The Brazilian public procurement system is not immune to the tensions presented in the previous section, despite the strategies of the federal government and subnational governments (26 states, 1 federal district, and more than 5,000 municipalities). The procurement laws are common to all the actors; however, the reality is different. The large number of actors involved and the lack of links between them makes it difficult to present a faithful picture of the Brazilian reality in relation to the three levels of government.

For this reason, most of the analysis presented in the literature refers to the federal executive power. A sample of this difficulty is the lack of consensus regarding the volume of resources spent by the Brazilian state on purchases. Estimates published by OECD (2014) for 2011 showed that public procurement accounted for 26.1% of total government spending in the country. As far as the federal government is concerned, the World Bank has estimated that between 2012 and 2014, this amount was 5% of national expenditures.

Unlike other countries, Brazil sought through laws and decrees to predict almost everything that governs the process of public acquisition. However, in some respects the forecast is still flawed. Thus, the Brazilian system is characterized by excessive free rider problem (see price agreement) and disproportionate formalism that hampered the manager works (Fiuza 2009).

From these characteristics, the actors involved in the purchase process pay more attention to the fulfillment of these formalities than the results of the procurement. In this sense, Motta (2010) argues that unlike the American context where the focus is the result of hiring, in Brazil the focus of the system rests on the fight against corruption. It can then be said that the most common objective among the actors involved in the public procurement system in Brazil is procedural, that is, to faithfully comply with the steps required in the legislation. The tension reported in the previous paragraph in the sense of seeking to guarantee transparency and accountability is generally exercised by the media, and by organs such as the public prosecutors, court of Auditors, and organization of civil society that exercise external control. The internal control, in particular the general controller of the Union, is other source of tension in the search for meeting the system's standards.

An important monitoring point for these agencies is the control of no-bidding contracts. Although the rule stated in the legal order is the execution of the bidding procedure, the law provides for non-enforceability when there is no possibility of competition and when competition is possible, but the execution of the bidding does not serve the public interest, the possibility of exemption is allowed. Data from the federal government procurement panel show that in 2017, 98,674 procurement processes were performed, out of this total 77,356 was no-bidding contracts. These values indicate that in practice when analyzing the purchases made by the federal government, the nonconducting of the bidding is the most common.

Thus, the public procurement system in Brazil has as its characteristics, the search to minimize the waste of resources, in particular, active waste in particular corruption. In this way, the system is designed to increase the efficiency of acquisition, mainly through the reduction of acquisition cost, considering its traditional orientation as being directed toward the value for money (Reis 2016).

This approach may lead to some distortions, leading, for example, to higher acquisition prices (Costa 2016) and the supply of substandard goods so that the supplier can increase its profit margin and recover potential losses at the bidding stage (Reis 2016). In Brazil, expressions such as coffee from bidding are common, to denote the coffee of low price, but of poor quality. Other modes of opportunistic behavior of suppliers are often recorded, such as ghost bidders and stunts, further distorting the purpose of bidding.

In addition to the problems already described, this approach has led to the realization of notoriously inefficient bids. To prove this, the Office of the Comptroller General conducted a study in 2018 analyzing data from electronic auctions from federal government. The study shows that some of the processes performed have a higher cost than the discount obtained: The average cost of conducting an electronic trading session by federal government agencies is U $ 5,315.00 (Brasil 2018) (Exchange rate 12/17/2018 available www.bc.gov.br).

Because of this inefficiency, efforts have been made to increase the efficiency of public procurement, mainly through the reduction of process costs, for example, using a system of fully digital supplier registration.

Added to these reported efforts is a paradigm shift, leading to new practices being adopted to generate public value in different dimensions. This search is evidenced in Law 8666/1993, the main legal system on the subject, which emphasizes that biddings must look beyond obtaining the most advantageous proposal for public administration to promote sustainable national development.

To ensure compliance with these objectives, the public purchasing system in Brazil has used state purchasing power to induce development in its different nuances. Public procurement can then enable the state to act sustainably, through sustainable procurement. Supporting companies and sectors considered strategic, with emphasis on micro enterprises and small business enterprises, family agriculture, and the development of research and new technologies, giving advantages to companies that apply resources in research and technological development in the country. More recently, mechanisms for the rehabilitation of inmates have also been inserted to allow public purchases to be used as a policy instrument.

This modification adds to several others perceived both in the planning phase of the purchase, as in the performance of supplier selection, and in contract management. Since the enactment of Law 8666/1993, the creation of the ComprasNet portal associated with the institution of the auction modality and the creation of mechanisms of governance such as the national register of the inapt and suspended companies demonstrate that the public procurement system in Brazil has undergone change. More recently, in order to allow greater flexibility against the excessively formalist culture, the differentiated contracting regime was created.

Other initiatives, such as the Procurement and Contracting Center and the price panel created by the federal government, are intended to modify a scenario, where excessive formalism, rigid norms, and lack of harmonization in certain procedures compromise the efficiency of purchases and consequently the achievement of its objectives. In addition, despite the excessive focus on fighting corruption, the need for formal mechanisms to manage reputation is still evident. There is also a need to improve procurement planning, as well as to improve governance mechanisms such as the use of incentives, in order to solve the problems arising from the drive of suppliers to maximize their interests by using corrupt practices.

These attempts to improve the legislation and procurement system are expressed by Fiuza and Medeiros (2013) which presented that until the year of publication of the study (2013), The Law No. 866/1993, the main regulation of public

procurement in the country, had already undergone 80 changes and was changed on average 4 times a year. This issue illustrates the need to modify the Brazilian public procurement system to address all previous issues, and particularly red tape problems. Currently, a new legal framework for public procurement in Brazil is underway in the legislature. The device consolidates several standards and instructions dispersed in several documents, and it aims to rationalize and modernize the current legislation, which dates from 1993. Its premises address questions such as the professionalization of purchasing agents, the need to improve contracting governance, stimulation of procurement planning, and incentive to adopt technology resources to facilitate the bidding process and contracts, as well as to ensure transparency of processes and the need to strengthen control in order to avoid future problems.

# Public Purchasing and Agency Theory

Agnieszka Chrisidu-Budnik
Institute of Administrative Studies, Faculty of Law, Administration and Economics, University of Wroclaw, Wroclaw, Poland

## Synonyms

Asymmetry of information; Contracting authority; Contractor; Public contracts

## Definition

Public procurement and, within this, public purchasing constitutes paid contracts concluded by and between the contracting authority's institution and the contractor's institution for services, supplies, or works. Public purchasing is accompanied by an asymmetry of information which assumes the form of an agency relationship.

## Introduction

An asymmetry of information applies to transactional connections when one of the parties has greater knowledge on the subject matter of the transaction than the other, which results in a disturbance in the balance of power of the participants of the transaction and can lead to the dysfunction of the public procurement market. Information asymmetry involves having unequal information resources and, in itself, generates an imbalance of information that puts one of the parties to the transaction in a privileged position over the other, which is forced to rely on limited information resources and therefore to act under conditions of insufficient information for correct decision-making. The source of information asymmetry on the public procurement market may be (1) errors in the methods of distributing information; (2) the intentions of the parties to the transaction, i.e., the contracting authority and the contractor; and (3) a breach of the procedures related to the transparency of making public purchases. In public purchasing, asymmetry of information takes the form of agency relations, namely, transactions in which a public entity (principal, contracting authority), places an order on a private entity or several entities (agent – contractor) to perform a service, thereby delegating some part of its powers and decision-making resources to it (Jensen and Meckling 1976; Fama 1980).

## Essence of the Agency Theory

The agency theory is based on at least three assumptions: (1) the principal's and agent's objectives are conflicting, and therefore, the behavior of the parties to the contract may be dominated by opportunistic attitudes; (2) the agent has a greater amount of information than the principal; and (3) the verification of the agent's activities related to the reduction of uncertainty as to the performance of the contract is capital-intensive for the principal and generates the so-called agency costs (Eisenhardt 1989).

## Change in Public Procurement and Agency Costs

Public contracts are a legal and economic category of a dynamic nature in the sense that they pass through three successive stages: preparation, conclusion, and performance of the contract. The implementation of each stage requires that the agency bears costs related to the existence of the agency relationship between the contracting authority and the contractor, which are divided into three groups:

1. Ex ante agency costs at the stage of preparing the contract (costs of looking for a partner for the cooperation, negotiating, establishing mutual information, searching, reviewing, and assessing available proposals).
2. *In tractu* agency costs arising at the contract performance stage, which are a consequence of contracting limitations (costs of monitoring the contractor's activities, costs of renegotiating the provisions of the contract).
3. Ex post agency costs that may become apparent upon completion of the contract (costs of enforcing the provisions of the contract, eliminating the defective consequences of the contract performance).

## Two Levels of Agency Theory Analysis in Public Purchasing

Agency theory is used in two contexts of analysis on the public purchasing market. The first context applies to the citizen – public authority relationship, while the second applies to the contracting

authority – contractor relationship. The first context of analysis is the public interest category. Public procurement and the purchases made within it primarily serve the purpose of satisfying the needs of a specific contracting authority, although the contracting authority's needs are also public needs, and the contracting authority acts in this respect as a representative of the public interest. In terms of the agency theory, the public authority is an agent acting in the public interest, namely, in the interest of the general public (the principal). Public purchases involve spending public funds which are not the property of the contracting authority but the property of the citizens – taxpayers – who finance the existence and functioning of the whole of the public sector (Yukins 2010). The employees of the contracting authority are engaged by the taxpayers to optimally spend public funds on their behalf and in their interest. Citizens – taxpayers, acting as principals, are entitled to expect the contracting authority, acting as their agent, to spend public funds, guided not only by its own particular interest but also by the public interest. The asymmetry of information in the relationship between the citizens (principal) and contracting authorities (agents) applies to the possibility of conflict of interest appearing, namely, the situation in which the contracting authority, or rather specific people acting for those institutions which are obliged to pursue the public interest in their professional activity, simultaneously have their own particular interests (financial, professional, etc.) which adversely affect the professional activities of the people who organize, implement, or supervise the performance of a specific public contract.

The second analysis context constitutes the category of a contract concluded by and between the authorities contracting for services, supplies or works, and their contractors. In this context, the analysis of the agency relationship arises from the contracting authority's institution entrusting specific tasks for implementation and from some of the contractor's ownership rights. The contracting authority (principal) and the contractor (agent) have conflicting objectives that may generate opportunistic behavior, because the contracting authority aims to perform the contract with the lowest possible transfers of public funds to the contractor, whose objective is to obtain the largest possible transfers for fulfilling a particular service. It is accepted in the classical agency theory that the agent acting on behalf of the principal has an information advantage, while a characteristic feature of the public procurement system and purchases made in it is the possibility of the appearance of mutual asymmetry of information (Chrisidu-Budnik and Przedańska 2017). Although the information advantage usually appears on the part of the contractor, it is also important to recognize such situations when the contracting authority is the better informed party in the agency relationship. Therefore, legal regulations emphasize the significance of the principles underlying a procedurally fair procedure for awarding a public contract, among which the principle of transparency is important. The principle of transparency is manifested in the obligation of the contracting authority to provide sufficient information on the activities currently being taken up or which are being planned that may be of relevance to individual contractors, including potential contractors, especially if information on certain facts is a sine qua non condition for contractors to be able to make rational choices related to a specific public contract. Such legal regulations eliminate the effect of the negative selection that is typical of the stage of preparing and concluding the contract, manifested in the fact that, when aiming to conclude the contract, the contracting authority redistributes information in such a way that it creates the ability to eliminate certain contracting authorities from participating in the public procurement procedure or hinders them in making rational decisions.

In the classical agency theory, it is assumed that the principal is a passive entity, i.e., it is largely obliged to rely on the agent's actions. In public purchasing, of key importance is that the contractor (agent) is forced to rely on the contracting authority's (principal's) activities, his diligence, and qualifications. In contrast with private contracts in public purchasing, which is one type of public contract, the preparation stage of

the public procurement is dominated by the contracting authority's activity. Even at the very beginning of the process of awarding the public contract, the decisions made by the contracting authority determine the behavior of the contractors and ultimately prejudge the quality of the effect of the contract implementation by eliminating the negative effects of concluding transactions and reducing agency *in tractu* and ex post costs. The removal of the asymmetry of information, which results here in the possibility of the contracting authority developing erroneous parameters (economic, technological, financial, etc.), requires relatively high ex ante agency costs to be incurred, which are related to the possibility of activating the negotiation procedures envisaged by law, which may include a technical dialogue and a competitive dialogue. The implementation of public purchasing is based on various types of contracts that can be classified, among others on the basis of the criterion of frequency of their conclusion and the specificity of the resources to which the purchase applies. Rare contracts for specialized resources (e.g., the transfer of know how) require the correct redistribution of information between the contracting authority and the contractor. The activation of negotiation procedures corresponds to the nature and specificity of the implementation of highly specialized projects that are frequently implemented in the public-private partnership formula. Furthermore, in the case of a low level of recurrence of transactions and a high level of specificity of resources (e.g., works), trends of an increase in the contractor's opportunistic attitude can be observed, especially at the stage of contract implementation, when the temptation to commit fraud can arise. The effect of the temptation to commit fraud appears at the stage of performance of the contract and applies to situations in which the contracting authority is unable to fully monitor the activities taken up by the contractor. Difficulties related to checking the contractor's activities are directly proportional to the level of complexity of the public contract, which, in turn, generates high agency costs *in tractu* related to the need to monitor the contractor's activities and ex post agency costs related to the need to eliminate the defective effects of the implementation of the contract.

## Synonyms

Administrative reforms; Public restructuring; Rationalization; Reengineering; Rightsizing

## Definition

Public reorganization refers to the rearrangement or restructuring of administrative structures within a government. It involves abolishing, merging, or creating governmental bodies and removing duplicate and overlapping functions. It is a bureaucratic response to the confluence of managerial goals set by an administration vis-à-vis the political currents and reforms impacting the government. The term has been

associated with concepts like rationalization, reengineering, and rightsizing.

## Introduction

Efforts to reorganize government structures have been a common practice (Peters 1992). The way administrative structures are organized exerts influence on the ability of a government to live up to its public mandate. Restructuring efforts do not operate in a vacuum. They can be located within the dominant managerial currents and political climate impacting government administration. Effectuating structural changes is thus both theoretical and applied and normative and scientific at the same time (Hawkins 1978).

In the Philippine politico-administrative setting, public reorganization has been present since the establishment of the Philippine Republic in 1899 and has been high on the agenda of various Philippine presidents since at least 1946 (Brillantes et al. 2018). Adopting reorganization has been closely aligned with the administrative orthodox of efficiency, economy, and effectiveness or what is categorically termed as the 3Es. Through the passage of time, other government principles have proven to be more pressing and fitting given the Philippine context (Brillantes and Lorenzo 2021; Brillantes et al. 2019).

## Overview of Public Reorganization

Government reorganization has been a constant topic of interest to political philosophers. Plato and Aristotle, for instance, believed that organizational structures could bring about significant differences in public functions (Hawkins 1978). Petronius held the view that reorganizational reforms serve as a springboard in making meaningful activities in the government. It is argued that governments from at least the era of the Romans have tried to remain viable by reorganizing their structures although it is not always the case that these attempts turned out positively (Peters 2001).

In more recent times, the practice of establishing a commission for public reorganization has emerged. This phenomenon can be traced back to the Progressive Era in the United States when a number of reforms were institutionalized to "modernize" the government in pursuit of an effective and efficient government. Proponents of government reorganization regard the restructuring efforts as an administrative strategy that could be employed to better pursue public goals. This call for reforms had resulted in landmark reforms including the abolishment of the spoils system, introduction of the merit system, and creation of the referendum. Former President Theodore Roosevelt, who was seen as the bearer of progressivism, set in motion some ambitious efforts to restructure the bureaucracy. All these reorganizational reforms constitute the early attempts to restructure the modern form of government (White 2002).

Some shift in purpose and perspective can be observed in public reorganization in post-World War II. A different historical milieu marked by industrialization, urbanization, and the ravages of war influenced the reorganization during this period (Dye and Gray 1980). The principles of economy and effectiveness were no longer the dominant deciding criteria for government policies. As demonstrated by the first systematic study on government reorganizations by Garnett (1980), all restructuring efforts were subsumed to the larger ambit of political interests of actors. Public reorganization then shifted to being understood first as a political issue and only subsequently as a managerial one (Hawkins 1978). As articulated by Hawkins (1978, p.133), "reorganization should be recognized *first* as a problem of politics and policy and only then as a matter of management."

As to the case of the Philippines, public reorganization has been a constant undertaking since the late nineteenth century. Since then on, public organization has taken on various labels such as rationalization, reengineering, and rightsizing. Taking off significantly from the American style and philosophy of government, Philippine reforms on public reorganization have been influenced by the political currents and reforms

from American Public Administration: from the traditional public administration – with its emphasis on economy, efficiency, and effectiveness – to modern public administration – with the inclusion of other government principles like equity, ethics, and accountability or the 5Es and an A framework in Philippine context (Brillantes and Lorenzo 2021). The following paragraphs explicate the different public reorganizational efforts instituted in Philippine bureaucracy since the founding of the First Philippine Republic.

### Pre-Government Survey Reorganizational Commission: 1898–1953

Not long after the proclamation of the First Philippine Republic, the Americans annexed the Philippines and set up their own colonial government. During this period, only the Philippine Commission, the sole body in charge of all legislative, executive, and administrative powers, was authorized to carry out reorganization moves. Public reorganization efforts during this period protected American interests, which were secured, for instance, through the appointment of American commissioners who acted as the heads of various executive departments and who furnished administrative recommendations (Viloria 1961). This kind of setup changed later on starting with the establishment of an all-Filipino Lower House that worked adjacently with the American-dominated Upper House (Gonzales and Deapera 1987).

The Revised Administrative Code of the Philippine Islands of 1917 imparted the earliest forms of guidelines for public reorganization that included concepts of continuous organization, institutional organization, and methods work (Viloria 1961). Throughout the Commonwealth Period, Philippine President Manuel L. Quezon was granted a blanket authority for a limited period to conduct urgent reorganization reforms through the issuance of executive orders vested by the Commonwealth Act No. 5 (1935). The Government Survey Board (GSB) came up with a factual survey of all existing departments and provided restructuring recommendations including the classification of positions and their corresponding qualifications, standardization of salaries, and plans for housing of offices and the needed equipment. During this period, there was only a single avenue whereby structuring recommendations could be approved, and that was through the exercise of presidential authority through the issuance of executive orders (Viloria 1961).

After World War II, President Manuel Roxas received the same blanket authority as granted to his predecessor to effectuate reorganization reforms. However, contrary to the time of President Quezon in which reforms could only be approved through executive orders, the Reorganizational Committee of 1947 could recourse through two ways, namely, through a separate executive order signed by the President and proposal of bills through the legislative assembly (Gonzales and Deapera 1987).

President Elpidio Quirino expanded the scope of administrative reforms. The Reorganization Commission of 1950 conducted a comprehensive study focusing on government-controlled corporations (GOCCs) (Gonzales and Deapera 1987). He signed the Republic Act No. 422, authorizing the reorganization of various executive departments, bureaus, offices, agencies, and other government instrumentalities including the GOCCs within one year. This law also specifically stipulated promoting principles of simplicity, economy, and efficiency for the improvement of public services (RA 422 1950; AO 109 1950).

### Government Survey Reorganizational Commission: 1954–1956

The first comprehensive attempt to reorganize the Philippine government was through the establishment of the Government Survey Reorganizational Commission (GSRC) established on June 9, 1954, by President Ramon Magsaysay through Republic Act No. 997 or An Act Creating the Government Survey and Reorganization Commission and Appropriating Funds Therefor (RA 997 1954). Section 2 specifies the law's objectives, pinpointing better execution of laws, building of a robust economy, and maximizing the fullest extend possible in the creation of an effective and efficient government. The Congress granted the GSRC with powers to restructure, and the law

had a provision that the GSRC could include members who did not form part of the government. Reorganization committees were set up across various government agencies that eventually resulted in the creation of 29 task forces assigned to provide reorganization plans to the GSRC. Each task force was made up of Filipino members supervised by an American consultant. President Magsaysay endorsed 53 plans out of the total of 61 plans submitted to the Congress. The Lower House of Congress rejected 20 plans while the Upper House rejected four. A report explaining the reasons for failure of implementation of reorganization plans involved opposition by the operating agencies, lack of understanding and clarity of the provisions of the plans, presidential inaction, and compliance only at the formal level (Abueva 1969; Gonzales and Deapera 1987; Viloria 1961).

### Presidential Commission on Reorganization: 1969–1986

The reorganization plan espoused by President Ferdinand Marcos took on a development-oriented approach through the Integrated Reorganization Plan (IRP) (Salas 1969). In all reorganization efforts, principles of simplicity, economy, and efficiency were upheld with a considerable emphasis on expanding social and economic development. This was also the first attempt to have a purely Filipino group heading the restructuring efforts. That is, no foreign consultants, advisers, and management firms were tapped. It also ushered in larger participation from the private sector and capitalized on a wider range of experts culled from various fields (Fabella 1978). The participation of actors coming from a range of sectors is argued to have contributed to the creation of a more comprehensive reorganization plan.

Republic Act No. 5435 was signed on September 9, 1968, to mandate a joint executive-legislative body assigned to supervise a study about the needed IRP for the executive branch. The body comprised different technical panels that covered every major functional government area (Abueva 1969). The Executive Order No. 281, passed on December 29, 1970, created the Presidential Commission, which was tasked to review the IRP submitted by the Commission on Reorganization. The legal reach of the Presidential Commission spanned the reorganization of executive government including the GOCCs while the judicial and legislative branches of the government, General Auditing Office, Commission on Elections, and local government agencies were exempted (RA 5435 1968). Consultations with the Cabinet and the Congress were subsequently held to elicit initial feedback about the reorganization plan. After some delays, the IRP was signed into law on September 24, 1972 through Presidential Decree No. 1 or the Reorganizing the Executive Branch of the National Government (Fabella 1978; PD No. 1, s. 1972).

### Presidential Commission on Government Reorganization: 1986–1992

The main challenges confronting public reorganization during the administration of President Corazon Aquino were entwined with the problems mainly inherited from the previous dictatorial regime of Ferdinand Marcos. As argued by Monsod (as cited by Gonzales and Deapera 1987), the Philippine government was beleaguered with a hefty external debt amounting to $26.3 billion, a high poverty rate of 80%, a bloated bureaucracy, and a high number of GOCCs facing financial dilemmas. For Genato-Rebullida (1988), the major bureaucratic problems were the centralization of authority, interventionist structures, policies and programs, and also bureaucratic gigantism.

The Presidential Commission on Reorganization from the previous administration was transformed into the Presidential Commission on Government Reorganization (PCGR) through Executive Order No. 5, s. 1986. The PCGR was tasked to standardize, collate, and compile all gathered recommendations through various public consultations. The PCGR was composed of two groups, a policy group, and a special studies group. The government efforts of PCGR were concentrated on two overarching goals, that of economic rationality and social justice. The Aquino administration took a private sector-oriented approach, which meant relying heavily

on market mechanisms (Gonzales and Deapera 1987) and continuously highlighting principles of simplicity, economy, and efficiency. The PCGR was also accused of being private-led, having a 78–22 ratio of consultants of which 78% were private-sector consultants (Gonzales and Deapera 1987).

### Presidential Commission on Streamlining the Bureaucracy: 1992–1998

Similar to the global managerial trend happening during this period, President Fidel Ramos opted for reengineering the Philippine government. The reengineering approach adopts the steering principle in which the role of government is geared toward steering rather than rowing – that is, intervening in the market only when necessary. This government philosophy was propounded by Osborne and Gaebler (1993) through their concept of Reinventing Government. The Ramos administration set up the Presidential Commission on Streamlining the Bureaucracy (PCSB) with the goal of reengineering the bureaucracy to accelerate economic growth. His administration was marked by economic liberalization as practiced in deregulating major industries and privatizing public enterprises. He signed the Executive Order No. 149 on December 28, 1993 to streamline the bureaucracy through some dispositive actions such as the transfer or integration of agencies and/or GOCCs to the appropriate departments and the abolition of functions, programs, or agencies.

### Presidential Committee on Effective Governance: 1998–2001

President Joseph Estrada continued the Ramos administration's reengineering program. In addition, he issued the Executive Order No. 165 on October 19, 1999 that created the Presidential Committee on Effective Governance (PCEG), which was tasked to supervise the institutional reforms. Concretely, it sought to strengthen and streamline the executive branch of government. It outlined some possible restructuring moves like the delineation of sectoral activities across different actors (government, business, and civil society), enhanced distribution of functions for every level of the government, elimination of unnecessary duplication, financial and manpower support, improvement of service delivery systems, and enhancement of standard organic support services. In addition, the Public Sector Institutional Strengthening and Streamlining Agenda was created to detail the necessary framework for streamlining processes (EO 165 1999).

### Rationalization Program: 2001–2010

President Gloria Macapagal Arroyo implemented government structuring through the rationalization program, the latest overhaul in the Philippine national government (Estocado-Dulpina 2020). The president signed the Executive Order No. 72, s. 2002 on February 11, 2002 to rationalize the agencies affiliated with the Office of the President. In order to concretize the rationalization program, another Executive Order, EO No. 145, s. 2002, was signed on November 2, 2002. It fully abolished eight agencies and removed another eight agencies but which functions were transferred to other agencies. An important executive order is the EO No. 366, s. 2004, which mandated a strategic review of all operations and organizations under the executive branch including options and incentives to the government employees that would be affected by the rationalization program. Another important executive order was signed on July 5, 2005, the EO No. 444, s. 2005, which provided authority to the Department of the Interior and Local Government to make a study regarding the best way of decentralizing and devolving activities of all departments, agencies, and bureaus.

### Rationalizing the Office of the President: 2010–2016

President Benigno Aquino III continued the rationalization program of the Arroyo administration. In 2010, he signed the Executive Order No. 18, s. 2010 that sought to rationalize the organization and supervision of some agencies attached or under the Office of the President. Similar to previous administrations, this move sought to remove redundant or overlapping agencies, abolish nonoperational or dormant agencies, and transfer functions and activities to local

government units or private-sector companies that can absorb these.

### National Government Rightsizing Program: 2016–Present

In his second State of the Nation Address delivered on July 24, 2017, President Rodrigo Duterte expressed government rightsizing as one of his priority bills through his National Government Rightsizing Program. He requested the Congress to provide the necessary authority to the executive branch to effectuate streamlining operations in the national government through a republic act (Department of Budget and Management 2016). He emphasized to all government agencies his directive on streamlining their functions and services and on making these efficient and people-friendly. The Duterte administration emphasized that the rightsizing program is not directly tantamount to downsizing measures but to come up with the appropriate structure and size of the bureaucracy that can provide quality services to the public without the bureaucratic red tape. In this regard, the Legislative-Executive Development Advisory Council categorized in 2017 the Rightsizing the National Government Act as urgent (Valencia 2017). The Committees on Government Reorganization and Appropriations of Congress passed on 24 May 2017 the House Bill No. 5707, Rightsizing the National Government Act, while the Bill was approved on July 26, 2017. A counterpart bill was also filed on May 15, 2017, in the Senate, the Senate Bill No. 1395 or An Act Rightsizing the National Government to Improve Public Service Delivery and for Other Purposes. A Committee on Rightsizing the Executive Branch was also constituted. It is tasked to spearhead the studies on rightsizing program. However, as of March 24, 2021, the rightsizing measures are reported to be thrown out due to a lack of support from the lawmakers (Magtulis 2021).

## Conclusion

Reorganization as applied in the government has implied rearranging public structural agencies and their respective functions and resources. It has involved the creation, abolishment, or merging of agencies and the removal of redundant and overlapping functions. In the Philippine context, prescriptions relating to organizational objectives and fiscal and personnel administration together with political considerations and consequences have been a constant feature of bureaucratic reforms on reorganization. The continuing interest in and reality of public reorganization in Philippine bureaucracy can be seen as a testament to the persistent difficulties underlying governance of public structures, specifically on how to meet the demands of the public given the political climate that is operating in every government term. With all these said, public sector reforms in the form of reorganization continue to form part of the Philippine government's attempts to bring about the *public* in public administration.

## Public Reports of Nursing Home Quality

Jennifer Gaudet Hefele, Pamela Nadash and Edward Alan Miller

Consumer decision-making; Market-based incentives; Regulation; Report cards; Quality improvement

## Introduction

Nursing homes provide short-term postacute skilled nursing facility and rehabilitative care after hospital discharge. They also provide care to those in need of long-term services and support as a result of frailty, disability, functional decline, and cognitive deficit. Ensuring quality care in nursing homes poses a particular problem for policymakers. People served by nursing homes are by definition vulnerable and poorly positioned to advocate for themselves; more than half are cognitively impaired. While family members can act as advocates for some, many families are overwhelmed by their caregiving responsibilities, and a few take advocacy beyond the personal level to the political. Consequently, pressure on policymakers to improve nursing home quality has been inconsistent. Nonetheless, nursing homes attract policy attention because they comprise a large and growing part of the healthcare sector that consumes an increasing proportion of public spending. Approximately 16,000 facilities operated nearly 1.7 million beds in 2014 (Centers for Medicare and Medicaid Services [CMS] 2015). In 2015, 5.1% of national healthcare expenditures went toward nursing homes and continuing care retirement communities; in 2016, the median annual cost of nursing home care was $82,125 and $92,300, respectively, for a semiprivate and private room (CMS 2016; Genworth Financial 2016). Theoretically, government should have substantial leverage over nursing homes, given that 71% of funding for nursing home services comes from government sources (with Medicaid – the public health insurance program for low-income Americans – reimbursing 57% of nursing home spending, and Medicare – the public health insurance program for elderly and permanently disabled Americans, reimbursing 14%) (American Health Care Association [AHCA] n.d.). However, quality has remained a problem: government's attempts to address it have mirrored overall trends in public policy and public administration, with a clear shift from regulatory to market-based approaches – most notably, public reporting.

## Rising of Public Reporting

Nursing home quality has been a perennial concern. Serious efforts to address it took off in the late-1980s, when the Institute of Medicine (1986) and the U.S. General Accounting Office (1986) found it "shockingly deficient." Reports such as these and other negative publicity resulted in the Nursing Home Reform Act (under Subtitle C of the Omnibus Budget Reconciliation Act of 1987). The law built on pre-existing regulations that set standards and imposed certification requirements, as well as introduced a survey process to monitor quality. This process involved inspections of nursing homes participating in Medicare or Medicaid for "deficiencies" in various aspects of care, rated according to the scope and severity of the deficiency. In addition, the law mandated new, higher standards of care, including minimum staffing requirements and quality-of-care monitoring that emphasized resident outcomes and quality of life, and strengthened the enforcement system. A critical development was requiring that nursing homes assess residents on a regular basis using a standardized Resident Assessment Instrument, which yielded reliable data on nursing home residents and allowed regulators to monitor nursing home performance. These changes went into effect in 1995, though requirements evolved over time as the certification process changed and measurement techniques and data availability improved.

Although these were important steps, they are widely viewed as insufficient in ensuring quality; in particular, the survey process has been the target of much critique (U.S. Government Accountability Office [GAO] 2008; Harrington et al. 2004; Miller and Mor 2008). Surveys of nursing homes are conducted by state inspectors on a periodic basis, using a federally stipulated survey protocol; however, survey results are considered weak indicators of underlying quality due to clear variations in surveyors' propensity to find deficiencies. For example, higher rates of deficiencies during the late 1990s were likely due to the increased emphasis placed on regulatory enforcement under the Clinton administration,

while drops during the Bush administration are ascribed to shifts in the intensity of regulatory oversight. Other reports have found considerable interstate inconsistencies in how surveys are conducted as well as understatement of serious quality problems in certain states (Kelly et al. 2008). Thus, the integrity of the survey process is an ongoing issue.

Consequently, the focus has shifted toward market-based policy tools; most notably, providing information that enables consumers to make informed choices among facilities, and creating financial incentives to spur providers to improve quality (i.e., "pay-for-performance") (Konetzka and Werner 2010). Both strategies depend on reliable and robust data on quality. Because these quality indicators play such a critical role in market-based approaches, they are the subject of intense study and debate. Naturally, researchers want to ensure that the indicators are solid from a technical perspective – that they measure what they are supposed to measure, and they do so reliably. They also aim to select indicators that avoid "teaching to the test" – that is, when an entity that knows it is being assessed on specific measures seeks to improve scores on those measures only, rather than improve overall performance. Providers are also concerned that measures are accurate; in addition, they seek to limit the burden of data collection, while policymakers seek to minimize overall costs and to produce data that is meaningful and useful to the public. Moreover, because many data elements are derived from the Resident Assessment Instrument mentioned previously, the accuracy of public reports depends on the careful collection and reporting of data by providers themselves – an inherent difficulty with such an approach. Concerns include variation in facility performance due to systematic coding differences in the assessment items from which the quality measures derive. Such differences may be unintentional, say, resulting from regional differences in how facility staff are trained to fill out those items. They may also reflect "gaming" whereby facilities purposefully increase or decrease the scores on the assessment items to make themselves look better on the resulting quality measures than would have otherwise been the case.

## Nursing Home Compare

This informed choice strategy to spurring quality improvement has resulted in the creation of state and federal report cards. In 2002, the Centers for Medicare and Medicaid Services (CMS) – the federal agency responsible for regulating nursing homes – released the first round of publicly accessible quality report cards on all US certified nursing homes through its new Nursing Home Compare website. This was the first time that consumers were given access to information on facility quality, enabling them and providers to see how facilities compared to each other. Similar efforts followed in other areas of healthcare: for example, the Hospital Compare website, launched in 2005, provided people information on the hospitals in their area, while the Home Health Compare website, launched in 2005 as well, provided people with information on home health agencies. Even now, new provider types, such as long-term care hospitals, are joining the game.

The Nursing Home Compare site provides general information on facilities (e.g., address, ownership status, number of beds), as well as information on staffing, state survey results, and quality measures based on aggregated data from the individual resident assessments noted earlier. The data reported on the site is updated every 3 months and published with a 6-month lag. The content and format of the information presented has evolved over time to better reflect the complexity of the nursing home experience. When it launched, 10 quality indicators were presented on Nursing Home Compare: four that addressed components of care related to short-stay residents (100 days or less, typically following a hospital admission) and six items that addressed components of care related to long-stay residents (101 days or more). More indicators were added over time – most recently, in 2016, the number of measures was increased to 25, divided among measures specific to both short and long stays.

Examples of the quality indicators reported include the proportion of long-stay residents with pressure sores, reporting moderate-to-severe pain, or receiving antipsychotic medications. The site also reports additional information that consumers can use to assess the overall quality of the nursing home, including nurse staffing levels, state inspection results, and any history of penalties.

One challenge reporting quality indicators is the issue of attributing responsibility for the quality of care to the provider, to the exclusion of anything that may be a result of patient differences or other factors out of provider control. To address this, results are risk-adjusted to account for the medical complexity and frailty of each facility's resident population. Risk-adjustment seeks to ensure that nursing homes are not penalized for serving a more complex mix of residents than their competitors by receiving lower scores. It also seeks to ensure that nursing homes do not "cherry pick" – that is, discriminate against more complex cases on admission, with the goal of ensuring better ratings.

Interpreting separate quality indicators can be challenging. Thus, one of the most important modifications to Nursing Home Compare was the introduction of a 5-star rating system in late 2008, with the aim of collapsing the many individual parameters reported in the report card into one easy-to-use metric. Nursing homes are assigned an overall quality rating of 1–5 stars (with a 1 being the lowest rating and a 5 being the highest) based on the three domains of staffing, survey deficiencies, and performance on a subset of the quality measures deriving from the aggregated resident assessment data. Additionally, each of the three individual domains receives a 5 star rating.

Developing fair ratings is complicated. Combining domains into a meaningful overall rating requires that specific parameters be weighted to reflect their overall importance; the survey rating, which takes the number, scope, and severity of deficiencies into account, is the most heavily weighted in the overall score. The relative importance of the individual components is, of course, subjective. Other changes have been made, as well. Most recently (in 2014) it became evident that facilities on the government's watch list of poorly performing nursing homes (known as Special Focus Facilities) frequently achieved four and five stars in the domains that rely on self-report (staffing and quality measures). This spurred changes that reduced reliance on self-report in determining the overall quality rating and made it harder for facilities to achieve four and five star ratings in both the overall and domain-specific scores.

## State Report Cards

In addition to the federal Nursing Home Compare site, some states report information on nursing homes on their own websites. A review of these sites (Castle et al. 2011) found 25 states that offered 29 report cards, with wide variations in user-friendliness and in the scope of data reported. At 34, Maryland's report card had the greatest number of indicators, reflecting domains such as survey deficiencies, pressure ulcers, restraint use, pain, depression, catheter use, antipsychotic use, factures, and falls. By contrast, many states – Alabama, Florida, Iowa, Kansas, Michigan, Missouri, North Carolina, New Jersey, Vermont, Washington, and Wisconsin – reported only one quality indicator – in most cases, survey deficiencies, which can be difficult for users to interpret, given that there are 185 areas where deficiencies can be cited, with each rated at 12 levels of scope and severity. Other states, such as Colorado, Indiana, New York, Ohio, and California, fell in between these two extremes with 5, 12, 19, 15, and 19 indicators, respectively.

Nursing Home Compare and most state public reporting programs have sought, in part, to minimize the administrative burdens and costs associated with data collection by populating report cards with information drawn from existing data sources. The result, however, has been a focus on clinical quality measures to the exclusion of factors which may be more relevant to individuals and families when selecting a nursing home. Some states, however, go above and beyond these parameters in what they report: additional

indicators often reflect other aspects of the consumer experience as reflected in user complaints, quality of life measures, and resident and family satisfaction scores. Indeed, several states (for example, Maryland, Minnesota, Rhode Island) mandate collection of user satisfaction data to support consumer decision-making – and, in the case of some, to incentive nursing homes under pay-for-performance programs. As yet, there is no federal mandate to collect or report user satisfaction, although many nursing homes do so voluntarily as part of their internal quality improvement or marketing programs. Interest in such a requirement is growing in light of recognition that the assessments of nursing home performance reflected in Nursing Home Compare's star rating system correspond poorly with consumer satisfaction (Williams et al. 2016; Miller et al. 2013).

## How Effective Is Public Reporting?

The big question is, of course, whether public reporting of nursing home quality has achieved the goal of improving quality. Although improving transparency by increasing consumer access to information is often seen as a worthwhile policy goal in-and-of-itself, the primary aim of public reporting is to enable consumers – prospective nursing home residents and their families – to use data to make better choices among facilities, and by doing so, create incentives for nursing homes to improve quality. Public reporting also provides nursing homes the opportunity to benchmark their own performance. Thus, another way in which public reporting can improve quality works directly through nursing homes themselves: under this mechanism, it is the nursing homes that are responsive to the quality reporting, using results to monitor their own performance – over time and against competitors or peers, thereby incentivizing improvements.

Overall, the research finds that Nursing Home Compare has had a positive effect on quality (Mukamel et al. 2008, 2014). Some assessments of whether public reporting works focus on consumers – if and how they use the information reported – while other research of whether public reporting works focus on providers – whether and how they have changed their behavior in response to the information posted. In general, evidence indicates that public reporting is more likely to have an impact on health care providers than it is on the selection of higher quality facilities by patients or families.

The research on consumer impact generally shows little awareness and use of Nursing Home Compare and quality report cards in general. This is reflected in a 2006 survey of families of nursing home residents, which found that just 12% recalled having used Nursing Home Compare to inform their choice (Castle 2009). Moreover, when accessed, consumers tend to use public reports to create a list of potential nursing home options instead of comparing those options against each other on the basis of the quality data reported. Impediments to using Nursing Home Compare and other public report cards include challenges navigating the websites and interpreting the data reported (Gerteis et al. 2007). They also include the absence of information important to consumers; for example, on quality of life and user satisfaction. Concerns about the sources and accuracy of the data reported serve to stymie use as well.

Societal shifts toward accessing and using online information may help overcome barriers to using public report cards. So too might education and marketing campaigns directed at increasing consumer awareness about specific public report cards such as Nursing Home Compare. The inclusion of additional desired information, integration of more user-friendly design features, and opportunities to personalize the data and its presentation would also help facilitate use. The potential to increase consumer responsiveness in light of modifications such as these is reflected in the adoption of the star rating system in Nursing Home Compare, which was associated with increased market share for the highest performing nursing homes and decreased market share for the lowest performing nursing homes (Werner et al. 2016). It is also reflected in greater patient confidence and satisfaction and higher probability of discharge to higher quality nursing homes among patients that were given an application that

enabled them to identify particular measures and their relative performance in developing composite scores from the data reported in Nursing Home Compare (Mukamel et al. 2016).

In contrast to consumers, studies on the provider impact of Nursing Home Compare confirm that public reports are on nursing home administrators' radars and that they take actions in response to the data reported. Further, a number of studies provide evidence that nursing homes have improved their performance on both long- and short-stay measures in response to Nursing Home Compare. Despite these overall improvements, there is still considerable variation in response: some studies suggest that performance improvement is not universal and that variation may be systematic, perhaps varying by nursing home characteristics, such as the racial and ethnic makeup of a nursing home's clientele and the proportion of clients paid for by Medicaid (Casalino and Elster 2007; Chien et al. 2007; Chin et al. 2007). Indeed, evidence suggests that public reporting may unintentionally exacerbate disparities with, for example, a widening gap in quality in nursing homes chosen by Medicare-only consumers and consumers eligible for both Medicaid and Medicare, possibly due to the limited supply of high quality providers in less affluent communities (Konetzka et al. 2015).

## Conclusion

Like any quality improvement mechanism, public reporting is only one part of an overall strategy for ensuring that nursing homes are safe, caring, and pleasant environments for their extremely vulnerable residents. A successful public reporting system will minimize data reporting burdens on the nursing homes themselves, while ensuring that the data elements collected are accurate, meaningful, fair, and hard to game. In addition, data must be presented in ways that maximize the likelihood that it will be used by its intended audience: in the case of nursing homes, this includes both consumers and providers. Evidence to date regarding the impact of the Nursing Home Compare site shows that it has only partially achieved these goals, and there is room for improvement. Most importantly, policymakers need to focus on identifying ways to make consumers more likely to use the site when making placement decisions (often a stressful and difficult time), and to ensure that the data presented are meaningful and meet the information preferences and needs of consumers.

# Public Scrutiny of Reforms in Fiji

Subhash Appanna[1], Malcolm Abbott[2] and Shavneet Sharma[1]
[1]The University of the South Pacific, Suva, Fiji
[2]Swinburne University of Technology, Melbourne, Vic, Australia

## Synonyms

Ethics – values; Public scrutiny – transparency; Resource allocation – wealth distribution

## Definition

Public scrutiny refers to the involvement of the public in decisions that affect them as this helps enhance transparency and accountability in public decision-making.

Public sector reforms involve changes that have been made to the public sector since the 1980s in order to improve performance.

Resource allocation is considered here within the framework of New Public Management-informed reforms in Fiji.

## Introduction

The need for reforms in the public sector in order to improve its performance has been part of the

P

public agenda for a long time. It acquired prominence in the 1960s (Arrow 1963), gained momentum in the 1970s (Niskanen 1971), and became a public policy imperative since the 1980s (Hood 1991). Hood (1991) referred to the emergent New Public Management (NPM) framework as a "model for all seasons." On the one hand, NPM's popularity is closely linked to ideological shifts in political philosophy on the role of government vis-à-vis the private sector in national economic development (Friedman 2002). On the other hand, NPM attempts to address deficiencies found in traditional public administration and assumes that the market is preferable to government as an intermediary for resource allocation, utilization, and public service delivery. NPM's promise thus has two points of focus: removal of the constraints of bureaucracy and freedom to make decisions in a more enterprising manner with the focus on efficiency, effectiveness, and economy.

With the New Public Management framework emphasizing market and psychological (ethics) controls while diminishing traditional bureaucratic sources of control in the public sector, decision-making in public entities has moved away from the public domain to boardrooms and closed-door settings. This critical change acquires particular significance when viewed in light of the fact that with a shift to "small government," the private sector is expected to shoulder much of the responsibility for generating economic activity to drive national economic growth (Friedman 2002). Key decisions regarding national wealth, resources, and business opportunities are made away from the public eye and driven by the market even though many of the assumptions behind the centralization of market control have been found wanting in studies on public sector reforms (Frederickson 2007). Thus the prescriptive removal of government controls, through "deregulation" at the macro level and the freeing of managerial decision-making space at the micro level, raise a control conundrum that has hounded the reform process over the past three decades with complaints that NPM is "long on promises and short on delivery." A close scrutiny of these experiences shows that at the centre of this process lies a crucial dilemma-ridden and often underemphasized requirement – the need for public scrutiny.

This entry critically examines three cases of decision-making, in the process of and after public sector reforms in Fiji, and argues that given the significance of the public sector in island economies like Fiji, the resource constraints faced, the peculiarities of the market, the power political structure, and the inevitable danger of "capture" of the delivery process at various levels, public scrutiny is absolutely necessary in decision-making in any publicly-funded entity.

## Theoretical Underpinnings of NPM

NPM's theoretical roots can be traced to the Chicago (Friedman 2002) and Austrian (Hayek 1978) schools of political economy, with their links to the New Right, in conjunction with the new institutional economics of Arrow (1963) and Niskanen (1971). NPM is based on the tenets of freedom to choose and freedom to manage. Freedom to choose arises from the new administrative reform doctrines built on ideas of contestability, user choice, transparency, and incentive structures. These come from the new institutional economics movement, which has its basis in Public Choice Theory, Agency Theory, Transaction Cost Theory, and Theories of Bureaucracy. On the other hand, freedom to manage entails business-type managerialism in the public sector in line with the international scientific management movement (Pollitt 1993). Administrative reform doctrines arising from this movement include the portability of professional management expertise, the paramountcy of professional over technical expertise, the need for high discretionary powers (free to manage) in management, and its centrality and indispensability for better organizational performance through the development of better organizational cultures, as well as active measurement and adjustment of organizational output. Thus changes brought about through NPM have been informed by what is widely referred to as the "New Right" in recognition of its paradoxical attempts to incorporate normative concerns in

what essentially remains the business philosophy of maximizing returns. This new ideology can also be referred to as the "Enlightened Left" in recognition of the fact that it has been embraced by traditionally left-leaning governments in their attempts to amalgamate the imperatives of both business and society. Whether the new reform package is seen as the "New Right" or the "Enlightened Left," it is clear that both attempt to construct an approach, now widely referred to as New Public Management (NPM) that will lead to greater efficiency, effectiveness, and economy in management in the public sector, as well as a redefinition of the links and roles of politics and administration in the delivery of public service.

On the other hand, in a marked departure from public administration, NPM centralizes the market as being preferable to government as an intermediary for resource allocation, utilization, and public service delivery "since it involves transactions that are voluntary, lateral and decentralised, in contrast to the compulsory, hierarchical and centralized activities of government" (Beetham 1987, p. 33). From this perspective, NPM attempts to remove the constraints of bureaucracy and free-up decision-making space at both the macro (government policy) and micro (management) levels. The central aim is to encourage the entrepreneurial spirit, while replacing institutional/government controls with organization-designed systems, complemented with an appropriate values system – it is here that the "hand of management" finds its niche within the overall control system. OECD describes NPM as a set of attempts to combine modern private sector type management practices with the logic of economics, while still retaining the core public service values. This raises the question of compatibility between public service values and private sector management practices as the values/ethics at play appear to differ. Moe (1984) considers the NPM values framework as being clearly different from that of traditional public administration with risks and insurmountable difficulties involved in attempting to amalgamate the two. Indeed, the ensuing confusions open up space for exploitative redirections through management initiatives that tend to show that the market has major shortcomings when elevated to the status of primary regulator. Beetham (1987, p. 27) says that, "a necessary condition for the market to operate . . . is a framework of legal compulsion, to guarantee the security of person and property, the integrity of contracts and the soundness of the monetary system." Thus with centralization of market control, there need to be provisos to ensure that it operates effectively. The challenge is to determine to what extent macro controls can be relaxed/removed without compromising quality and standards in the delivery of public services (Appana and Goundar 2011, p. 56). Arellano-Gault (2000, p. 400) elaborates this further by saying that "in the absence of robust institutions for administrative control and oversight (the) use of NPM (as a top-down reform strategy) faces two basic dangers: (a) over relying on techniques over substantive reform and (b) underestimating the difficulty of changing the existing bureaucratic culture." This could lead to symbolic rather than actual change. Appana (2011) contended that active attempts were made in Fiji to perpetuate symbolic change while portraying publicly that the reform process was a serious exercise that had to be undertaken with urgency at different points in time depending on the imperatives of governments.

## Background to Reforms in Fiji

In Fiji, noticeable reforms began with the hugely unpopular wage freeze imposed by the Alliance government in 1985. This not only triggered the birth of the Fiji Labour Party but was one of the factors that led to the unexpected electoral demise of the Alliance Party and the subsequent Rabuka coup of May 1987. The political uncertainty that followed created a regulatory void in the upper echelons of the civil service that presented an unprecedented opportunity for "capture" of the decision-making processes of the public bureaucracy. A number of factors converged to facilitate this change that essentially amounted to unseen and unannounced reforms in the public service. One, the Rabuka government

was constantly threatened with rebellion from within, thus it depended on a group of key bureaucrats to keep the civil service functioning while he grappled with the various conflicting interests that comprised his government. This allowed the bureaucrats to consolidate their power positions and enhance their influence within the civil service. Two, the political ideology of "Fijian self-determination" and ethnonationalism that followed the build-up to and aftermath of Rabuka's coup made any initiative undertaken in the name of ethnic Fijians, beyond question. This is where programs to assist Fijians into the business sector became part of national priority. Three, NPM provided a ready-made rationale for these reform initiatives. It also fortuitously helped move decision-making away from the public eye; this allowed a group of connected bureaucrats, politicians, and other officials to ensure that they controlled opportunities arising from the many "Fijian assistance" schemes that followed the Rabuka coup. These demands would continue to increase over time, and with it, the opportunities for capitalizing on reform initiatives for personal gain (Appana 2011).

Towards the end of Rabuka's reign, a number of public enterprises were restructured in haste. There was a clear link between these restructures, the impending 1999 elections and the fact that the prime movers of reforms were bent on ensuring that the most should be accomplished while that government was still in power as much was to change even if Rabuka's SVT Party were to return to power. Unfortunately, a totally unexpected change in government happened with the electoral success of Chaudhry and the subsequent formation of the People's Coalition Government. This led to the 2000 coup, which suddenly opened up opportunities for senior bureaucrats like Laisenia Qarase to enter politics. Thus some of the cabal that had formed during Rabuka's reign now moved into politics and became key decision makers. This served to strengthen this group further as their links remained – their influence now extended into parliament. Moreover, the reform model that guided public decision-making and further reforms in Fiji now served to rationalize boardroom-type decision-making away from public scrutiny. Only outcomes were announced for public reporting to an uncritical, accepting, and largely lackadaisical media that appeared to be compromised at times (Singh 2010). It is within this environment that reforms proceeded in Fiji after 2001. A critical analysis of the 2001 and 2006 elections shows that the ballot box might have been compromised and that despite Fiji having a democratic framework for governance and elections, the people, policies, and performance focus of the electorate in choosing government was not operating as expected – the link between government performance and public popularity at the polls appeared to depend on factors other than those expected in a functioning democracy. Government had to ensure that Fijian-assistance schemes remained on the public agenda while Fijian business assistance was prioritized. This ensured that public sector reforms proceeded in the personal interests of the cabal mentioned earlier as opportunities arising were accessed very differently from that envisaged by NPM – the rationale of Fijian business assistance was used to enrich a small group of connected individuals. The next section analyses three cases where decisions were made away from the public eye in the interests of connected individuals.

## Kadavu House

Kadavu House in Suva is owned by the Kadavu Development Company of which the Kadavu Provincial Council (and hence the people of Kadavu) are substantial owners. The multistoried building was financed by provincial fundraising and a $14 million "affirmative action" loan from the Fiji National Provident Fund (FNPF). The loan was supported by the Qarase Government which also guaranteed it would tenant the building, and Government paid $880,000 in advance rents for a building they would never tenant. In 2007, Commodore Bainimarama questioned the unreasonably high rents. Further enquiry revealed that Kadavu Development Company was not registered, had not held an AGM for 20 years, and

that several SDL parliamentarians were on the board of the company. This was a typical arrangement in the business model that had sprung up through the public sector reform program during SDL reign. Bainimarama immediately questioned whether the ordinary people of Kadavu would ever benefit.

A closer scrutiny shows that there is a further complication in the model as Kadavu Holdings Limited is a fully owned subsidiary of Kadavu Development Company Limited which is the business arm of Kadavu Provincial Council. It is Kadavu Holdings Ltd. that owns Kadavu House according to Kadavu Holdings Limited Chairman, Sakeasi Waqanivavalagi (FS 19/5/10). Thus the ownership of Kadavu House has been removed from the people of Kadavu through a sophisticated business model that is usually used to minimize, complicate, and frustrate tracing ownership and liability within the private sector management model that has been used in the public sector in pseudo-public organizations like provincial councils. An inquiry conducted by chartered accounting firm, Ernst & Young showed that "a total of 71.94 per cent of Kadavu Development Company Limited shares belong communally to the people of Kadavu generally and their chiefs together with certain individual tikina." "The balance of the shares in Kadavu Development Company Limited, are owned by individuals from the vanua of Kadavu who had purchased shares during share drives organized by the company between 1972 and about 1986," explained Waqanivavalagi (FS 19/5/10). The late Kadavu chief, Ratu Josateki Nawalowalo was reported to have added, "As a member of the provincial council for the last eight years and as a former chairman I am privy to council and register of company information that the Kadavu Provincial Council owns around 80 per cent shareholdings. This is through injection of funds totaling around $140,000 and around $39,000 individual shareholdings by the people of Kadavu" (FS 19/5/10). When the ownership dispute arose in May 2010, the company denied these shareholdings and never proved their claim that the provincial council had set up Kadavu Holdings Limited through injection of shares.

It is clear from this case that Kadavu Provincial Council is being frustrated in its efforts to exert control over Kadavu Holdings Ltd. through Kadavu Development Corporation Limited. The architects of the set-up had forced a complicated process of clarification that was likely to involve staggering legal costs. Thus in this case, the removal of public scrutiny through reforms that encouraged boardroom-type "private" decision-making had led to provincial frustration on the issue of ownership and accountability of a company that was established as the business arm of a publicly funded provincial council. Incidentally, the main "mover" of Fijian business initiatives since 1987 was a son of Kadavu and the same happened in other provincial councils who were advised by the same cadre of officials.

## Ba Provincial Council and Telecommunications

Fiji's public was forced to pay unacceptable rates for, and accept subquality telecommunications services for, an extended period of time because Telecom Fiji, as the main incumbent, had a monopoly contract to provide ICT services. At one stage, its Chairman, Lionel Yee, presented government with a tongue-in-cheek multi-million-dollar figure to buy off the contract if it wanted to introduce competition. It was the same with Vodafone (jointly owned by Telecom Fiji), the first provider of mobile network in Fiji. When Vodafone arrived in 1996, it was allowed total freedom to set prices as well as service standards. Its prohibitive tariffs that were whittled down as it expanded its market base have been seen as a major feat of management in some circles when in fact it was simply a case of success within a monopolistic framework. The fact that super-normal profits were in the offing in the telecom sector did not miss the eyes of competitors. Digicel was the first to mount a challenge through partnership with Ba Holdings Ltd. In a US$185m deal struck in 2005, Digicel (51%) and Ba Holdings Ltd. (49%) were set to establish operations when Ballu Khan's Pacific Connex entered the scene and declared its interest in the sector.

Subsequently, at a closed Ba Holdings Ltd. meeting, Board members were mysteriously changed and the Digicel agreement was rescinded without much comment. Sivaniolo Naulago, Pacific Connex's sales and marketing manager, was a board member of Ba Holdings Ltd. at the time. When the full implications of these decisions became known in Ba Province, a group of 30 youths stormed the Ba Provincial Council building accusing Ballu Khan of interference in Ba Holdings Ltd. matters (FT 26/2/10).

Here again, decision-making had been moved behind closed doors in typical private-sector style as per the prescriptions of NPM. This allowed a connected group of individuals to capture and influence the decision-making processes out of the public eye for narrow, as opposed to public gain, in another pseudo-public organization that was created by a provincial council funded by public monies through the Fijian Affairs Board. This tendency, to make decisions outside the ambit of public scrutiny, for personal gains was not limited to provincial councils and their business arms; it extended to major decisions by government in its reform agenda. The next case scrutinizes a landmark reform in the civil service.

## Permanent Secretaries to CEOs

A major visible reform implemented in the civil service during Qarase's reign was the restructure of the former Permanent Secretary posts to CEO positions, in line with the NPM prescription for top-class professional management in the public sector. International consultancy firm, Mercer Human Resource Consulting, was hired through an obscure, nonpublic process at an unconfirmed cost of $5m to search for appropriate personnel to fill the newly created CEO posts. After a worldwide search, they found all the CEOs in Fiji; 23 were hired immediately on 31 December 2003 (*Islands Business*, 9/6/04). This was later increased to 27. Salaries and perks for these CEOs was more than double that paid to the former Permanent Secretaries. Moreover, contrary to theoretical prescriptions, the CEO contracts were set at 5 years (not 3 as was the norm). In addition, in what appeared like a knee-jerk attempt to quell whatever public concerns might have arisen, only two CEOs were Indo-Fijians. Very interestingly, in mid-2004, PM Qarase stressed that "traditional civil service ( ) must become more aware and responsive to the needs of the business people. There is a gap that must be closed between the business community and the Civil Service" (Koyamaibole and Roberts 2006). This was followed by a series of private-public engagement forums on "regulatory reforms."

It is clear from this declaration by Qarase that the CEOs had been hired to primarily function as liaisons between government and the private sector where contracts were being brokered in line with the reform model. Qarase's relationship with his CEOs was particularly interesting because he had himself been a senior civil servant in 1987 when the Rabuka coup was executed. In the administrative vacuum that the political upheaval created, the troubled Rabuka regime relied heavily on senior civil servants to keep the government apparatus functioning. Qarase was part of a cadre of civil servants who played a key role at that juncture. Later when he was appointed General Manager of the Fiji Development Bank (1991–1998), he played a key role, as a director of Fijian Holdings Limited and advisor to both the Fijian Affairs Board and the Great Council of Chiefs, in opening up privileged shares to private Fijian investors. Earlier in 1989, the precariously propped Rabuka government loaned $20m to Fijian Holdings Limited through the Fijian Affairs Board to fund Fijian provincial shareholding in the company and make way for a re-classing of company shares as A and B. The privileged A-shares were to be made available to non-provincial Fijian buyers, while the ordinary B-shares were available for collective provincial purchases. Many of the individuals who bought shares in Fijian Holdings Limited at the time were prominent public servants who obtained loans mainly from the Qarase-managed Fiji Development Bank. Qarase thus had established a unique relationship with a cadre of senior civil servants and politicians through his simultaneous involvement with Fijian Holdings Limited and the Fiji

Development Bank. This relationship was highlighted when he made an unexplained attempt to redeploy a number of CEOs in 2006. Very interestingly, 10 opposed the directive and 6 sought rare legal redress from the courts of law. This type of defiance by senior civil servants was rare in Fiji and could easily be interpreted to mean that government's position was compromised, through its boardroom-type decision-making, and many of the CEOs were privy to this – much more appeared to be happening in government than what met the public eye.

## Discussion

NPM-driven reforms necessitate reliance on the market for control of conduct because by definition, deregulation creates a regulatory "void" that is expected to be filled by the market mechanism to ensure proper conduct among the different stakeholders and participants. There are various assumptions behind this expectation that have been found wanting in studies on public sector reforms (Frederickson 2007). This realization led to a centralization of the "hand of management" in the reform process as ethical conduct among managers and leaders is expected to compensate for the shortcomings of the market. In the process, two significant developments occurred: one, a greater reliance was placed on managers/leaders; and two, decision-making moved away from the public eye and into boardrooms and closed door offices. Public scrutiny thus became incidental in the process of public sector reforms.

In the three cases outlined above, this movement of decision-making away from the public eye led to "capture" of the decision processes involved by a group of connected individuals driven by greed. Weber (1947) makes a clear distinction between greed-driven endeavor and that driven by a realization that work is a duty for the individual. This helps distinguish between the expectations of the self-interest assumption that helps rationalize the bases of NPM and the types of behavior that has led to exploitation of the openings and opportunities that arise from deregulation. In fact, in the first two cases, reforms were used to centralize and influence decision-making within a small coterie of people; this was done by using personal positions of influence with what appeared to be open defiance of wider provincial interests – public scrutiny was not part of the process.

This is particularly problematic because even though exponents of democracy differ on its institutional requirements, Fiji has been bequeathed with a Westminster system of democratic government. One of the crucial requirements for this to work is for the electorate to have ultimate control on the conduct of government through the ballot box. Within this framework, the conduct of government is evaluated via its people (politicians/managers/leaders), policies, and performance. Government is therefore held responsible and accountable for the conduct of its public service via public scrutiny. The effectiveness of this scrutiny is affected negatively by moving decision-making away from the public eye. This is where the news media plays an absolutely indispensable role in collecting and disseminating information in a questioning, alert, and nonpartisan manner.

On the other hand, government also needs to improve public access to its decision-making processes. This has a number of advantages: public scrutiny of government conduct inevitably leads to public involvement; this enhances and improves public understanding of reforms. At the next stage, through a dynamic process, the probability of acceptance of changes is greatly improved. It is this acceptance that eases the way to meaningful participation that ensures the success as well as persistence of change. After all, public sector reforms are ultimately aimed at bringing about transformative change.

This was also an avowed aim of the Bainimarama regime through its *People's Charter for Change, Peace and Prosperity* and the resultant reforms that were being undertaken in Fiji. This, however, took a turn when the constitution-making process was abruptly changed in 2013. Later, after the FijiFirst government changed the structure and composition of the Public Accounts Committee in 2016, a new model of decision-making appeared to have emerged with "public scrutiny" being modified to mean "government

scrutiny." It would help the process greatly if nonpartisan public scrutiny were to be centralized unequivocally as an integral part of the change process.

## Synonyms

Bookkeeping; Financial disclosure; Financial information system; Financial reporting; Financial statement

## Definition

Accounting is the most basic tool for recording operations occurred between an entity and other operators, which provides the information useful for decision making and accountability. The accounting system in a public entity represents the basis to correctly manage financial resources and to evaluate the government performance and the achievement of political goals. Government accounting can support the socioeconomic development of a community by providing to public managers and politicians the necessary information to support decision making and making them accountable to citizens. As any other tool, accounting does not have values of its own, and does not decide the allocation of resources, but provides decision makers with the appropriate set of information to allocate resources coherently with the pursued objectives. Accounting is also a communication tool, being considered as the "language of the business" and assumes a relevant role in the process of accountability.

## Introduction

Accounting has been always considered as a key function of any organization, playing the fundamental role of collecting and recording data related to any economic transaction occurred for the entity. Grounding on data and information collected, the accounting system provides the entities with different kind of reports, analysis, and information that can usefully support the decision making as well as the accountability towards a large plethora of stakeholders. Accounting can consider basically transaction occurred with other entities (*financial* accounting) or can focus on internal transactions and operations (*internal* or *cost* or *management* accounting).

The former is intended primarily as a tool to inform stakeholders (both internal and external) about the financial position and the financial performance of the entity. Financial accounting is generally oriented to represent the past (*historical perspective*), recording any event already happened and summarizing in the financial reporting the financial situation of the entity and the results of the management at the end of the financial year. It is generally required by law, and the preparation of financial reporting is mandatory for any kind of entity. However, accounting records can also be prepared to support the planning and programming in the entity, resulting in the preparation of the budget.

Management accounting represents an undisputable support for managers in the decision making as well as in planning and programming activities and, further, in evaluating performance. It is prepared voluntary, as a tool to support managers and can have both a future and/or an historical orientation. Management accounting is fundamental in the preparation of the budget, because it provides information to be used in planning and controlling operations.

Table 1 summarizes the main features of financial and management accounting side by side.

Of course the two accounting systems are strictly related, as information from financial accounting constitutes the starting point for management accounting as well as the management accounting systems can support the preparation of financial reporting providing appropriate information (e.g., data for assessing inventories). This entry is devoted to discuss the constituents of financial accounting.

While basic accounting function can be handled by bookkeepers, advanced accounting and the preparation of reports to be published for a large variety of stakeholders requires the

**Public Sector Accounting, Table 1** Financial accounting vs managerial accounting

| | Financial accounting | Management accounting |
|---|---|---|
| **Users** | Information is mainly prepared for external users (other entities, lenders, citizens, etc.) | Information is mainly prepared to support managers and employees in the management of the entity and in the decision making |
| **Objectives** | To disclose at the end of the financial year the financial position and the economic performance of the entity | To support managers by providing information useful to plan, set the goals, and evaluate the performance |
| **Object** | It concerns the whole entity, even if some figures may be organized considering functions or organizational units inside the entity | It considers organizational units/functions/ processes, depending on the choice done in any single entity |
| **Law requirements** | Legally required to prepare financial reporting in accordance with the law | No legal requirements |
| **Format** | Financial reporting is prepared following specific format required by law (and it can change in accordance with national legislation) | As it accomplishes internal information need, no specific formats are required |
| **Rules** | Prepared following national (or international) laws, standards, and regulations | No rules requirements. In some countries and for some sectors, guidelines can be provided |
| **Time** | Defined by law. Financial reporting should be prepared at least once a year (or even semiannual, quarterly, etc.) | As needed, even with different frequency for different reports in the same entity |

competence of highly qualified accountants. To this end, each country has its own rules and laws to regulate what training and education accountants have to do in order to gain a recognized qualification, such as certified public accountant (CPA) in the USA or chartered accountant in Canada and in most European countries.

## Aim and Scope of Public Sector Accounting

Being accounting instrumental to organization, it differs in relation to the object and to the users' needs that it tries to accomplish. Traditionally, differences have been recognized between public sector accounting (PSA) and accounting for private entities (Lapsley 1988).

Historically, private sector accounting has been considered basically as a tool to support the decision about the best allocation of capital and to evaluate the performance of the enterprise and its financial position. The financial reporting – which is the fundamental output of financial accounting in private entities – is drawn to meet the information needs of investors and lenders, thus satisfying also the information needs of other users, for instance, governments, employees, customers, and suppliers. Of course the use of accounting information is affected by the context and by the evolution of the management functions.

Public sector accounting refers to the set of rules, procedures, and tools developed to support the financial management in the public sector entities. In this regards, the public sector comprises a wide variety of entities, including regional and local governments (municipalities, provinces, regions, etc.), central or federal governments, public enterprises (generally involved in the production of electricity, waste, gas, etc.), and public institutional systems (universities, hospitals, schools, etc.). However, public enterprises generally follow accounting rules and procedures provided for private entities, due to their high involvement with market's roles.

In the public sector, the attention has been traditionally focused on the budget, seen as political act which provides the path for the allocation of financial and nonfinancial resources among different political programs and purposes (Wildavsky 1964). Managers are responsible for the execution of the budget and for spending the resources in accordance with political plans. The financial reporting is generally compared with the budget in order to recognize to what extent the management has employed resources in accordance with the original programs.

The role of accounting in the public sector realm has evolved during the time, in accordance with the information needs of stakeholders and decision makers and has been almost considered as a core function for government's financial control but also evolves in relation to the development of democracy (Broadbent and Guthrie 1992). In the most developed countries, the function of accountability has been largely recognized, and the role of accounting in supporting the audit function has been claimed by international organizations (World Bank, OECD, International Monetary Fund, etc.) as a tool to reduce corruption and promote transparency and democratic participation.

Furthermore, the New Public Management philosophy has moved the attention from the correct use of resources to outputs and then to outcomes, introducing private-like and managerial logic and tools, diverting the traditional focus of accounting from spending power and incremental budget allocation to costs and revenues, assets and liabilities, and the efficient use of resources (Hood 1995). This approach has provoked a shift towards accrual accounting based systems, as explained in the following sections.

The purposes of public sector accounting can be summarized as follow:

- To support the managers in governing the entity in a timely, reliable, and efficient manner allowing to follow all transactions regularly undertaken by the entity (e.g., to make payments, to collect taxes, to buy assets and other inputs for the production activities, etc.)
- To properly recognize how public money have been spent, making it possible the necessary financial control

- To keep systematic records of transactions occurred in order to allow aggregation and analysis of operations in accordance with different information needs
- To support the preparation of periodical financial reporting both to accomplish stewardship and accountability needs, as well as for decision making

Bearing in mind these basic purposes, the following section deals with the theories that have been developed in PSA, in turn influencing the development of financial reporting.

## Accounting Theories and Users' Information Need

Three fundamental features distinguish public by private entities with regard to the accounting system:

- Public sector entities manage financial resources, but they do not expect any profit neither any kind of distribution of gain can be provided.
- Financial resources can be obtained by leaving taxes or by transfers from other public entities or even by financial transactions on the market, even if in most of the cases the prices applied do not consider any gain and sometimes neither cover the costs of production.
- Most of their goals are societal in nature, and the related outputs cannot be always recognized and measured in monetary terms.

The purpose of any accounting system is to provide relevant, reliable, and useful information for the main users. In this sense, it is important to understand who are the users of accounting information provided by public entities (as already defined). But before this, following Jones and Pendlebury (2000), two basic concepts of financial accounting should be defined before discussing about users of financial information and their needs, which represents the "two ends of a spectrum of reporting possibilities": *stewardship* and *accountability.*

Financial reporting has traditionally been connected to the stewardship function. The stewardship responsibility can concern those managing someone else's assets who have to demonstrate that those assets have not been misappropriated. In this view, the financial statement should represent how the assets and liabilities have been managed, while the profit and loss account shows the increase or decrease of wealth within the year.

The accountability refers to the responsibility of actions towards someone else. In the public sector domain, the concept of accountability is extremely wide, as it can concern electoral promises, actions undertaken by politicians in general and government representatives in particular, public inquiries, and so on. In relation to financial accountability, it can be defined as the responsibility for the performance of financial and non-financial resources managed by the entity. In this sense, a great attention should be paid on the performance of the entity. Accountability is the cornerstone of financial reporting in the public sector domain, and the superiority of an accountability framework over a decision usefulness has been claimed because of the social nature of the relationship that characterized the actors (Pallot 1992). Consequently, the need for sound financial reporting arises, able to inform any kind of stakeholder not only about resources spent in comparison with what have been planned in the budget but even about the quantity and the quality of the services provided. Assuming this approach, a proper identification of the different categories of stakeholders is worth to be done.

Broadly speaking, everyone can be interested in the accounting system of a public organization, but to understand the kind of information needed that should be satisfied through the financial reporting in the public domain, it is necessary to consider a more specific group of "primary users."

Without any claim to be exhaustive, we can consider the following categories of users:

- Governing bodies
- Oversights bodies and regulators
- Managers and civil servants

- Citizens, including media, pressure groups, taxpayers, voters
- Resource providers, including customers of public services
- Present and potential lenders and other creditors
- Present and potential funders

Each of the above categories is characterized by a different possibility to access complementary information and for some of them the costs to obtain additional data would be too high in comparison with benefits. For this reason, a wide and complete financial reporting should be available for all, in order to satisfy the fundamental information needs.

According to the literature and to the documents and frameworks issued by standard setters internationally (Jones and Pendlebury 2000; GASB 1987; IPSASB 2013), the information needs of the different kind of stakeholders can be brought back to four main categories:

1. *To verify if public funds have been used consistently with the law and contractual requirements*. This aspect includes the consideration of fiscal compliance, as well as compliance with finance-related rules, regulations, and laws. Moreover, information should be released to allow users in determining whether fees have been determined in accordance with laws, regulations, and contractual requirements.
2. *To verify if public funds have been used consistently with plans (or political authorizations)*. This aspect requires to compare financial results with the budget approved by governmental bodies as well as with any variations occurred during the financial year to the original budget. The impact of the acquisition and the allocation of resources should be assessed in relation to the achievement of operational objectives.
3. *To verify if public funds have been used in an efficient and effective manner*. In this regard, some performance measures should be provided, complementing information released by the financial statement and the income statement. Information about the cost of services provided as well as the disclosure of performance indicators directly aimed at assessing efficiency and effectiveness have been considered progressively as a part of the financial reporting for global purposes. This information should also allow users in evaluating the managerial and organizational performance.
4. *To verify the financial position of the public entity and its financial sustainability for the future*. This aspect includes the evaluation of the financial equilibrium in the short term and the ability of the entity to meet financial obligations as they come due, as well as the financial viability of the entity and the evaluation of financial risk. In time of crisis, the adoption of specific tools attuned to prevent financial distress has been greatly emphasized.

Notably, several standard setters worldwide have developed conceptual frameworks aimed at identifying who are the users and which are the user's need in regards to the financial reporting for public sector entities (Canadian Institute of Chartered Accountants, the Federal Accounting Standards Advisory Board in US, Australian Accounting Standard Board, the International Public Sector Accounting Standard Board, etc.), providing further support for the preparation of sound financial information.

Financial reporting of public sector entities is subject to external audit, which ensures the complete and correct presentation of financial information in accordance with law's requirements. In the same way, the audit function is stronger than in the private sector, due to the public nature of the entity, which made the respect of rules an undeniable imperative.

The production of information does not ensure a proper use by the different categories of stakeholders: A large literature on transparency and accountability has discussed the use and misuse of information provided by public entities (Grimmelikhuijsen 2011). However, public entities have to be transparent and accountable because they manage public resources and have to guarantee accountability to enhance trust in

governments. In this sense, information and communication technology and the use of Internet can support the availability and use of financial information by all categories of users.

## Accounting Systems in Public Sector

The accounting system in use in public sector organizations varies across organizations, countries, and over time and consequently does the form of financial reporting. The accounting base depends on when the transactions to be recorded are recognized and on the metrics adopted for the measurement and evaluation processes.

Broadly speaking, two accounting trends can be recognized: a traditional one, based on cash accounting and a modern one, based on accrual accounting. In the middle, at least two variations can be considered: the modified cash based system and the modified accrual accounting system. However, several nuances of those systems can be identified by looking deeply in the public sector accounting system adopted in single countries. In this vein, in the US state and local government accounting – where financial resources are called "funds" – the term "fund accounting" is sometimes adopted to indicate state and local government accounting. In some continental European countries, the cameralistic approach has largely established itself until recently, being now progressively superseded by the most sponsored system, accrual accounting. The following subsections, far from being exhaustive, are intended to depict the main features of the different systems. It is worth to underline that the following accounting systems are not mutually exclusive and that in some countries the coexistence of two different approaches has been required.

### Fund Accounting

Fund accounting has been the basis for the governmental accounting model since the beginning of the twentieth century (Ingram 1986). It can be defined as a method of segregating resources into categories – the so-called "funds" – in the aim of identifying clearly both the sources and the use done and of providing a strict monitoring of these resources, often in compliance with specific administrative requirements. This kind of system emphasizes the accountability function in relation to specific resources. It can be adopted both under cash basis as well as accrual basis, even if the former is the most largely adopted. However, it has been blamed because it fails to describe the operating results of the entity as a whole, it is not easy to understand for external stakeholders, reducing the possibility for taxpayers to verify the need of taxes, and is more keen to manipulation by managers. On the other hand, fund accounting has been seen as a device to reduce information costs associated with controlling bureaucrats' behavior (Ingram 1986).

The fund accounting is still in use in schools, colleges, and universities, in particular in the USA, because it is considered the most suitable to respond to a stewardship obligation and to demonstrate that all resources were recorded and used in accordance with the directives of the outside sources providers. (The Governmental Accounting Standards Board (GASB) provides the Statement 35, actually under reexamination within the larger program related to the Financial reporting model – see www.gasb.org.) Resources are classified as *unrestricted* or *restricted* where the former includes all funds received by an institution with no specific purposes, while the latter is limited by donors or other external agencies to specific purposes or programs. Separate accounting for each fund is intended to control and demonstrate the expenditures following the restrictions received.

### Cash Accounting

The cash accounting system is considered as the traditional accounting system in the public sector because it is mainly intended in controlling the flow of financial resources, rather than to calculate income. Actually, the possibility to know how public resources are collected and spent has been considered for long time as the fundamental information for public entities.

Following the cash accounting system, revenues are counted when cash (or cash equivalent) is actually received as well as expenses are recorded only when paid. This base of accounting presents

several advantages which have determined the large adoption, especially in budget accounting: it is easy to do and to understand, even for not accounting-educated users, it is objective, and can reduce manipulations, allowing a better control in the use of public resources. However, it is simple only if the entity is simple. Moreover, as already underlined by scholars (Jones and Pendlebury 2010), the cash-basis system does not allow to evaluate the financial sustainability, nor the economic balance of the entity, neither the cost of services, thus reducing the resource management. Traditionally governments adopt the cash basis to prepare their budgets, or modified cash basis in order to properly record at least credits and debits after the yearâ€™s end. Limited attention is paid to the accountability function.

### Commitment and Cameralistic Accounting

In many governments, the cash basis is combined with the *commitment basis* for budgetary control purposes. The expected expenditures are entered in the budget as commitments (or obligations) being authorized by political representatives in relation to functions or programs. When the cash payment occurs, the obligation is extinguished. Similarly, the expected revenues (including taxes, fees and charges, grants and transfers, investment earnings, and other revenues, mostly related to public services) represent the right to collect money.

The commitment basis is sometimes combined with the *cameralistic approach*. Under this accounting basis, followed by many European countries, financial resources are devoted to a precise objective during the budgeting process. It has been also named as "budgetary accounting" or "governmental budgetary accounting" (Christiaens and Rommel 2008). This approach tends to connect the organizational structure to the accounting systems: in fact, generally speaking the structure of funds usually corresponds to the organizational structure (Bergmann 2009). The main purpose of this approach is to emphasize the role of the budget in the planning process, where the budget plays a pivotal role in managing and controlling resources collected. The cameralistic approach has the undisputable advantage to clearly identify the responsibility in managing resources. However, it creates limitation for the organization and does not facilitate the control on the whole entity

### Modified Cash Accounting and Modified Accrual Accounting

Not a common definition has been identified for "modified cash accounting" or "modified accrual accounting," these bases incorporating all the possible nuances between cash and accrual. Under the *modified cash-basis system*, transactions are recognized on cash basis during the year while at year's end the setup of unpaid accounts and/or receivables are calculated. The basic need that this system tries to accomplish is to keep control on accounts receivable and accounts payable. This allows having a clearer picture of the financial situation of the entity in comparison with the one offered by the pure cash accounting system. However, even under this basis of accounting is not possible to assess the performance of the entity.

In the modified accrual-basis system, expenditures are entered in the accounting records when resources are received and revenues when they are measurable and available within the accounting period or shortly afterward. Certain classes of assets or liabilities (e.g., heritage assets, infrastructures, pension funds, etc.) are not recognized as in the accrual basis. Sometimes, modified accrual has been considered as a milestone in the process of introducing full accrual accounting. This is also the proposal done by the International Public Sector Accounting Standards Board which has issued a standard devoted to cash accounting (Cash Basis IPSAS) and promote the progressive adoption of accrual systems, especially for developing countries.

### Accrual Accounting

The large call for accrual accounting reforms most directly reflects the establishment of the New Public Management (NPM) movement (Guthrie et al. 1999). Under this wave, accrual accounting has been considered as a guarantee for high accountability, transparency, and as a tool to promote public financial management.

Under accrual accounting, the stage of "authorization of expenditure" which characterizes cameralistic, fund and commitment basis of account, is taken for granted, as a part of the budgeting process (which can be prepared following one of the systems already described). Thus, the purchasing cycle starts recording transaction affecting assets, liabilities, or profit and loss, considering the date in which the invoice is received, rather than the payment. At the end of the year, "end of period adjustments" should be recorded in order to comply with the accounting principle of realization. In the revenue cycle, the differences are less relevant – broadly speaking – because generally revenues are recognized when they occur and the needs of adjustments are reduced to those events in which the matching principle between costs and revenues does not occur.

Under accrual accounting, public sector entities can measure and disclose their assets and liabilities and can keep under control their financial position. Of course the adoption of this basis of accounting requires professional knowledge by both prepares and users of accounting information (Bergmann 2009).

Pros and cons of accrual accounting are still under discussion among scholars (Christensen 2007; Christiaens and Rommel 2008; Cohen et al. 2013). Those promoting the adoption of accrual basis have emphasized the following benefits:

- Accrual accounting can make financial reporting of public entities comparable with entities in the private sector. The need of calculating full cost for public services derives from the need of comparing the data with prices proposed by services' suppliers.
- The progressive changes towards a model of network of producers in the public domain requires the possibility to compare and consolidate financial reporting, urging the adoption of similar accounting systems.
- Accrual basis would avoid most of the problems related to the cash basis, like ignorance of noncash costs, misuses of assets, and not appropriate management of liabilities. By adopting accrual accounting, full and accurate costs can be calculated, paving the way for improving efficiency in the public sector.
- Accrual accounting will improve external accountability, preventing manipulation of public finance by politicians. In this sense, it will also improve intergenerational equity and reduce the risk of corruption.
- Assuming that governments play the role of agents in proving public services, even if they are not concerned with profit measures, financial reporting should be based on accruals figures, measuring the financial performance and the financial position of the entity. This will ensure the ability to demonstrate to all stakeholders – and basically to citizens – that the government operates consistently with the political mandate received.

Some concerns have been raised, however, about difficulties in the implementation of accrual accounting, some related to the conceptual suitability of accrual basis to the public domain, others more related to the concrete applicability of accrual features. The most discussed concerns can be summarized as follows:

- Accrual accounting is connected to other public sector reforms and the benefits deriving from the accounting system cannot be taken for granted.
- The concept of costs and revenues has different meaning in governments, being some inputs and most of the outputs difficult to measure in monetary terms.
- Governmental accrual accounting is characterized by the so-called nonexchange transactions, like taxes, subsidies, donation, grants, etc. In most of the cases, there is no possibility of matching the costs related to public services provided on a collective basis with resources collected.
- Accrual accounting information is more difficult and more costly to produce, requiring the appropriate education both by prepares and by users. Additionally, an adequate support by information and communication technologies must be assured, increasing further the cost of this accounting system.

- The definition of assets is sometimes problematic in a public sector context and some specific assets and liabilities are difficult to estimate (e.g., heritage assets).

Other issues that would deserve a deeper and empirical investigation are related to the different approaches followed in implementing accrual accounting (Pina et al. 2009); in different countries the adoption of accrual accounting has assumed different nuances, which makes in any case really difficult to compare financial reporting produced by the same kind of public entities operating in different countries.

Among the other possibilities, the coexistence of cameralistic and accrual accounting has been seen as a suitable compromise, especially assuming that the ability to control the spending of the authorized budget cannot be guaranteed just by accrual accounting (Christiaens and Rommel 2008).

The doubts still persisting towards the application of accrual accounting have been clearly expressed by scholars: "It is accepted that there is value in the use of accrual accounting in the public sector, but the manner and form in which accrual accounting has been introduced and developed results in the presentation of accounting data as if it may validly be compared with business sector accounting information" (Ellwood and Newberry 2007: 567).

However, the adoption of accrual accounting systems is nowadays seen as an unarrestable process and – as Lapsley et al. (2009) notice – the adoption of accrual based principle is basically a political rather than a technical question, related with the progressive commercialization of the public sector.

## The Adoption of Different Accounting Systems Worldwide

Taking into account that the boundaries between the four different basic accounting systems adopted by public sector entities can be blurred and that different applications of each accounting basis can be followed (Pina et al. 2009), the following picture gives a quite clear idea of the situation worldwide, in accordance with the study done by Pricewaterhousecoopers (PwC) in 2015 in regards to central government (Fig. 1).

The picture clearly shows that English-speaking countries have already adopted accrual systems and that most of the European countries are progressively moving in the same direction. However, modified accrual and modified cash basis still persist around the world and several underdeveloped countries have still to adopt a clear system.

**Public Sector Accounting, Fig. 1** The government accounting landscape worldwide (Source: PwC 2015)

The confirmation that the trend toward the adoption of accrual accounting systems is progressively expanding itself is shown by the Fig. 2. Anglo-Saxon countries lead the bounce, having being the earlier adopters of accrual accounting in the public sector. However, it is very interesting to notice that the less developed countries that are now developing an accounting system for public entities are directly converging toward the accrual accounting, sometimes using for few years the cash accounting system, but with the clear idea since the beginning to quickly move towards accrual.

The implementation process of a complete accounting system needs to be supported by appropriate guidelines aimed at ensuring faithfulness and completeness of the financial reporting.

To this end, national and international bodies have developed sets of accounting standards to support the preparation of financial reporting by public entities. A brief discussion about the role of accounting standards both at national and international level will conclude the discussion.

## The Role of Accounting Standards at National and International Level

The implementation of a certain kind of accounting system is generally chosen under a set of accounting principles and standards. Once a country has issued a group of accounting standards for the whole public sector – or even for specific group of entities (e.g., a specific set for local governments, for health care units, etc.) – one should expect that the financial reporting is prepared under this set of rules in order to present a true and fair view of the financial situation of the entity. The main aim is to enhance the quality of financial reporting prepared under common rules and to favor the comparability of financial reporting prepared by the same group of entities. Moreover, the adoption of a set of accounting principles will support the preparation of consolidated accounts.

Broadly speaking, in many countries worldwide – at least in the English-speaking world – sets of accounting standards have been prepared, based on accrual accounting and using business accounting as a point of departure. This can be considered again as a consequence of the establishment of the New Public Management philosophy and of the strong belief that bringing the public sector to work according to the market's rules and mechanisms would improve efficiency and effectiveness of public entities. However, accounting standards have not been always prepared considering the features of the public sector, rather extending existing set of principles prepared for private companies to the governmental entities. This approach has revealed very soon its weakness and progressively the accounting standards have been adapted to the information needs of the public sector. While preparing accounting standards, in fact, some features of public sector entities should be considered, as they affect the

**Public Sector Accounting, Fig. 2** Expected trend toward accrual accounting by continent (Source: PwC 2015, p. 14)

approach to follow in the recognition, measurement, and disclosure of the items in the financial reporting.

Following Barton (2005), some of these features are summarized hereafter.

First of all, governments are funded collectively by citizens through taxes (and not through the sale of goods and services). Governments are agents of citizens; consequently, they are supposed to act in the interest of the public, putting in action programs and plans to improve the economic and social wellbeing of the whole community. Public goods are provided by government to all citizens and they do not generate a profit. Additionally, government provides social services and welfare support, especially to disadvantaged citizens. As the financial information provided through the annual report is addressed to satisfy the information needs of the main users, a proper set of accounting standards should be built considering these features. This means that valuation and assessment rules would be different from those applied in the private sector, despite the adoption of the same accrual accounting systems.

Assuming that the need of comparison and consolidation can overcome the national border, in 1986 the International Federation of Accountants (IFAC) established the Public Sector Committee (PSC) with the broad mandate to develop programs for the improvement of public sector financial management and accountability. After a period in which the PSC established itself, preparing large studies specialized in public sector accounting, in 2004 the International Public Sector Accounting Standards Board (IPSASB) was created having as a core mission the preparation of a credible set of standards to be adopted worldwide. A new agreement in 2006 made the IPSASB leading a project to develop a public sector conceptual framework applicable to the preparation and the presentation of general purpose financial reports of public sector entities, including but not limited to financial statement and notes. The project has accelerated its place of implementation in 2010 and in 2014 the first phase was concluded. The framework is devoted to clarify accounting policies, techniques, and evaluation rules, while it pays less attention to the definition of users and users' needs.

The Board aims to enhance the quality and transparency of public sector financial reporting by establishing high quality standards (International Public Sector Accounting Standards – IPSASs) for the use by public sector entities and guidance on issues and experiences in financial reporting for national, regional, and local governments; related governmental agencies; and the constituencies they serve. The IPSASB has developed a large set of accounting standards accrual based (the full list and the project related to standards under development can be found at http://www.ipsasb.org/) plus one cash-basis standard for countries moving toward accrual accounting. In fact, the Board considers the cash basis as not sufficient to properly report and manage public financial resources and considers accrual accounting as the most suitable accounting basis for providing a comprehensive and accurate view of government's financial position.

Even if the IPSASB has not any legislative power and single countries have to implement in their own laws and regulations in the adoption of IPSASs, at the moment more than one hundred countries worldwide have adopted or are in the process of adopting IPSASs and several international organization (including the United Nations and the European Commission) have embraced IPSASs for the preparation of financial reporting.

It must be noted that IPSASs have been blamed at the beginning because of their similarity with International Financial Reporting Standards (IFRS) issued by the International Accounting Standards Board (IASB) for entities operating in the private sector, which prevent IPSASs to properly consider specific problems of public sector entities. Stronger criticisms were raised for not considering properly who are the users and the users' need. These criticalities have been in part superseded with the issue of the conceptual framework, which clearly identifies citizens as primary users of the financial reporting, in their quality of services recipients and resources providers.

However, the path for the implementation of a common set of accounting standards on accrual basis is all but easy: as recent studies demonstrated (Christiaens et al. 2015; Brusca et al. 2015) there are several reasons that can impede

or delay the adoption of the IPSAS, the first being the existence of dominating local or country-wise business accounting rules. Also the high costs of implementation related to education of civil servants and appropriate support from information and communication technology coupled with problems connected with the accounting maturity of single countries can prevent the adoption of IPSASs (Manes Rossi et al. 2016).

It is worth to notice that the European Commission has launched a project aimed at developing a set of European Public Sector Accounting Standards (EPSAS) to be followed by all countries members of the European Union. The Commission recognizes that the IPSAS are not immediately applicable in all European countries, even if they represent an indisputable reference and that a set of accounting standards shaped on the features of European countries is a necessary tool for further fiscal and budgetary integration in the EU. However, even in this case several impediments should be faced, and the road towards the application of international standards is in any case complicated.

## Conclusions

Nowadays the accounting systems in the public domain tend to the accrual basis and a wide movement for the adoption of harmonized accounting principles and financial reporting can be observed worldwide. The new systems shift towards a model similar to those adopted in the private sector, while retaining the specific features of public sector entities. However, the process is neither easy nor obvious because several difficulties and impediments obstacle the changes. Accounting is not a neutral technology because it determines what citizens can know about public entities, it is a tool to encourage or discourage political changes. As Jones (2007) and Ellwood and Newberry (2007) suggest, there is a potential normative aspect related to the path undertaken by the large adoption of accrual accounting, while a deeper consideration of accounting tradition, political model of public service delivery, and democracy in each country should be considered while choosing accounting system and financial reporting model. But this discussion goes well beyond the limit of this contribute.

# Public Sector Collaboration and Social Policy

Martin Mayer and Robert Kenter
Old Dominion University, Norfolk, VA, USA

## Synonyms

Coalitions; Multi-Organizational Arrangements; Shared resources

## Definition

Collaboration is the process of multiple stakeholders sharing resources and working together toward the achievement of a common goal.

Local government refers to the administration of a town, county, or other municipal jurisdiction by public officials.

## Introduction

Public administration literature within the last few decades has seen an emergence of collaboration scholarship as a distinctive field of study (McKinney and Field 2008; Thomson et al. 2009). As this discipline developed, it has diverged in several unrelated directions leaving many gaps concerning the fundamental aspects of collaboration literature and theory. One of the most prominent fissures is the lack of a universally accepted definition of collaboration. Although this lack of consensus is not endemic to collaboration literature, it certainly poses difficulties for those attempting to grasp the core elements of this theory. Prior to developing a practical theory of collaboration, there must be a general understanding of the elements of the concept of collaboration (Wood and Gray 1991).

As can be expected from any multidisciplinary concept, the collaboration literature has become muddled from being examined through the lenses of different disciplines. While this undoubtedly adds to the field's depth and broad applicability, it also makes it difficult to compare results and to know whether or not what is being discussed is actually collaboration and not a form of coordination or even cooperation. Collaboration is a theoretical model with a large gap between theory and praxis; despite its general utility, the multiple conceptualizations may be the barrier in applying this very important concept to practice in a more effective manner. The remainder of this entry will overview the need for collaboration, the definitional issues that have plagued the fields development, prominent models and frameworks of collaboration, and a brief discussion of collaborative

structure and the general elements of public sector collaboration before offering a conclusion highlighting and summarizing the development of the literature and field. The principles espoused within this entry may be universally applied, but the scope and context is American local government.

## Public Sector Collaboration

### Wicked Problems

The early collaboration literature grew out of a discussion over wicked problems; the types of problems, that are multilayered, have no clear solution and require significant time and resources to address, if they can be addressed at all. Wicked policy issues know no boundary, often impacting multiple segments of society all with different stakes, levels of involvement, goals, and even desired outcomes. The great challenge presented by these types of intractable problems can also be turned into an opportunity: an opportunity to involve diverse stakeholders, spread risk, and maximize available resources in an attempt at addressing the problem. Collaboration acts as the conduit for different segments of stakeholders to focus their efforts and resources on a particular issue that would be significantly more difficult to address alone.

Wicked problems do not respect jurisdiction or affiliation; however, it is important within collaboration that stakeholders hold a common view of the problem. The stakeholders must understand the policy issue as a wicked problem that must be addressed for the betterment of all involved. Motivations may differ, but agreement on the problem is crucial. When stakeholders share a common view of the problem, there is an existing bond and certain level of social capital that is critical to early collaborative success. This convening bond or social capital between stakeholders helps to facilitate a sense of group ownership over an issue and impacts the development and capability of the collaborative in moving the group forward to address the wicked problem (Ansell and Gash 2007).

### The Definitional Issue

While few would argue against collaboration as an effective problem-solving mechanism, defining exactly what collaboration is and what it is not has been an ongoing issue plaguing the development of the literature and field for decades.

Gray (1985) posits a three-phase model of collaboration: problem setting, direction setting, and structuring. She argues the phases are progressive, and a collaborative effort will naturally move along this continuum. In problem setting, the stakeholders are identified within a domain. Gray argues a successful collaboration is born at this phase. The problem is identified and the stakeholder's place becomes legitimized. The next phase the process moves through is direction setting. It is here the collaboration begins to develop a "sense of common purpose" (p. 917), in the form of shared goals and values. The ultimate or end goal of the collaboration is established at this stage. However, without a strong set of stakeholders and clear goal congruence, the collaboration will likely fail. The final phase is structuring, and it is here that the domain begins to self-regulate itself. Stakeholders need to "create long-term structures to support and sustain their collective appreciation and problem-solving activities" (p. 917). At this phase a division of labor occurs, and short- and long-term goals are set.

In perhaps the seminal work on collaboration theory, Gray's (1989) *Collaborating*: *Finding Common Ground For Multi Party Problems*, the author emphasizes that collaboration should not be considered a panacea, but rather a process to facilitate a "mutually determined solution" (p. xviii). Gray articulates the value of collective wisdom when addressing a messy or wicked policy issue. In defining collaboration, Gray highlights several key elements including a shared view of the problem, shared vision of the solution, flat organizational structure, interdependency among stakeholders, conflict that is managed and embraced, mutual ownership of decisions, and collective responsibility for direction of the effort.

As popular as Gray's work has become, it merely started the definitional discussion. Others have attempted to build on the premises outlined,

and at the same time, other authors have taken their conceptions of collaboration in more divergent directions. Frey et al. (2006) define collaboration as the means to achieve a shared goal among stakeholders. Often collaboration emerges "as organizations interact with one another to create new organizational and social structures" resulting from devolution, changing technology, scarce resources, and increasing organizational interdependence (Thomson et al. 2009, p. 23). Although a true collaboration allows stakeholders to achieve shared goals while addressing complex and often wicked problems, the overuse of the term "collaboration" is pervasive and has become a blanket phrase to imply a wide range of partnerships adding yet another barrier to implementation for practitioners (Gajda 2004).

The multidisciplined nature of the field and divergent accounts for what comprise collaboration has affected the development of an agreed upon definition of what collaboration is and how it works. This has further hamstrung efforts to build on and grow existing literature, further impacting the ability to properly evaluate the impacts of collaboration. The resulting ambiguity has led to a substantial amount of time and effort devoted to the discussion of what collaboration is not, rather than what it is (Wachhaus 2012).

So what is collaboration? The literature is filled with differing opinions and definitions, definitions that have some utility, but lack the ability to be stand-alone sufficient. Wood and Gray (1991) first point out this phenomenon when reviewing collaborative research articles under the assumption that a generalized definition of collaboration existed. What the authors found was unexpected, a great divergence among authors with definitions of varying usefulness and contribution. With the benefit of more than 20 years of additional development, Mayer and Kenter (2015) repeated the exercise to surprisingly similar results.

## Models and Frameworks of Collaboration

A number of scholars have attempted to differentiate and define collaboration. This is often done through the presentation of models and frameworks to represent what is and what is not collaboration as well as to simplify the interactions between stakeholders. This section highlights some of the more prominent models and frameworks of collaboration in an attempt to elucidate the differences between concepts and how they define collaboration.

Thomson et al. (2009) argue that there are five dimensions of collaboration: governance, administration, organizational autonomy, mutuality, and norms. They define governance as the rules of the structure that direct the work being done within the effort. Administration focuses on implementation, and how the ideas generated within the effort will be converted to actions. Organizational autonomy addresses the issue of role identity of the stakeholders and the balance they must maintain between their identity within their parent organization and their identity within the collaboration. The authors then describe mutuality as "beneficial interdependencies based either on differing interests or shared interest" (p. 27). Finally, they argue the norms of reciprocity and trust are necessary for the collaboration to function.

Similar frameworks are presented by Horwath and Morrison (2007), Cigler (1999), Gajda (2004), Frey et al. (2006), and McNamara (2012), with these authors presenting models of partnering defined along a continuum. Horwath and Morrison (2007) suggest a five-stage scale of collaboration: communication (least complex), cooperation, coordination, coalition, and integration (most complex) (see Fig. 1). They argue stakeholders in all five stages are collaborating, but at different levels of complexity. This approach is unique since it refers to the whole scale as collaboration, as opposed to collaboration being a single point on the continuum.

**Public Sector Collaboration and Social Policy, Fig. 1** The Expanding Continuum of Collaboration Processes

Other researchers include the term collaboration within the continuum. Cigler (1999), Gajda (2004), Frey et al. (2006), and McNamara (2012) all describe continuums that include the terms cooperation, coordination, and collaboration as points along the continuum. Cigler (1999) offers a four-stage model in which she places networking prior to cooperating. Frey et al. (2006) expand the continuum by adding coexisting and communicating prior to cooperating and unification following collaboration. Gajda (2004) adds networking to the left of cooperation and unifying to the right of collaboration. McNamara (2012) proposes a broader approach with a three-point model beginning with cooperation before moving to coordination and finally collaboration.

These examples suggest that the main components of the frameworks are cooperation, coordination, and collaboration. At the far left end of the continuum are cooperative arrangements. They tend to be informal and short in duration and require little or no loss of organizational autonomy. Often street-level workers from independent organizations share the same clients. In an effort to increase their limited capacity, they exchange information to make the delivery of services more efficient. Cooperation occurs at lower levels of organizations and often without the approval or even the knowledge of management. The midpoint of the continuum is coordination. Coordination is a process through which organizations work together formally and is initiated from mid to upper level management. The effort requires a commitment of intellectual as well as physical resources toward the achievement of an agreed upon and well-defined goal. When a coordinated response is initiated, there may be little or no loss of autonomy, and participants retain membership in their parent organization when they come to the table. Coordinated efforts are longer in duration and hierarchical in nature.

The final point on the continuum is collaboration. This is characterized by open and frequent communication among stakeholders, a common vision, and shared resources to address a wicked policy issue (McNamara 2012). The degree of shared power and the closeness of stakeholder relationships have a tendency to blur traditional organizational boundaries further differentiating collaboration from cooperation and coordination (Keast et al. 2007).

These examples of existing frameworks of collaboration have a number of things in common. All start on one point of a continuum, generally at a level more characteristic of cooperation than collaboration and incrementally progress across the continuum to increasingly integrated partnerships, before eventually reaching collaboration and in some cases unification or coexistence. The labels and number of the stages differ, but the models and frameworks have many similarities, including the elements of each stage and many of the same characteristics. Yet with significant overlap and so much in common, there has been little effort to synthesize models and frameworks of collaboration going back once again to the common discussion over what it not collaboration as opposed to what is.

## Collaborative Structure

Collaboration should be structured in a fashion that dissipates authority among stakeholders. The effort does not have to be voluntary or emergent; collaborations convened by government authorities are often times created through legislative action. Regardless of who convenes the effort, when voluntary interactions transform into a cohesive working unit, one will find true collaboration. In order to ensure that everyone is on equal ground, including less prominent stakeholder organizations, every effort should be made by convening stakeholders to promote a professional-to-professional relationship environment rather than subordinate to superior.

As organizations continue to struggle with economic austerity, pooling or sharing resources becomes an attractive option that may not have been considered previously. Pooled resources refer to more than just money; technical expertise and non-tangible aspects, such as shared legitimacy, are among the many items that can be viewed as a shared resource. The inclusion of which should ultimately make the collaborative stronger than any one single organization would be in addressing wicked problems.

## Elements of Public Sector Collaboration

While the definitional issue is ongoing, there has been general agreement on the elements that constitute collaboration. These elements include the following:

### Communication

Strong communication is a cornerstone of collaborative behavior; hearing others and knowing you are heard can be the first step in breaking down walls and effectively solving problems. Most collaborative efforts involve stakeholders from diverse backgrounds and corporate cultures that often do not share a common lexicon. Nurturing a well-planned communication strategy will most certainly result in increased formal and informal idea sharing and consensus decision-making which will lead to increased efficacy of the effort.

### Consensus Decision-Making

Decisions are made jointly and collectively through a participative process. An atmosphere of consensus and compromise spans differences among individual organizations and promotes transparency and equality among participants. In consensus decision-making, the process is more important than the results. Stakeholders will feel more involved if they feel they are granted a voice in the process regardless of the outcome.

### Diverse Stakeholders

Diverse stakeholders bring a variety of resources and perceptions to the table, which allow for a true collective, collaborative process in which organizational capacity is increased. Additionally, this diverse lateral thinking allows ideas and processes from across disciplines to be applied within the collaborative effort. The presence of well-rounded diverse stakeholders allows for more robust and nuanced strategies to address the issue at hand.

### Goals

Clear, concise, collectively forged, reasonable goals are a cornerstone of the foundation of any collaboration. Clear and reasonable goals and assessment of those goals allow members to bring a deliverable objective to management at their home organization to track the efficacy of the effort. While forging collective goals is an important part of the process, there must be a balance between individual goals of the stakeholders' organization and the collective goals of the collaborative effort.

### Leadership

In collaboration, leadership is most likely to be a hybrid of formal and informal styles. Successful leadership often involves the role of a convener or champion, an individual or group of individuals who has taken the initiative in convening the effort. The convener often takes on a leadership role early on in the process to identify stakeholders, setting initial goals and facilitating the process in the early fragile stages of the effort. A successful leader will need to manage the inevitable conflict and refocus stakeholders' energy on the collective goals of the collaboration.

### Shared Resources

One of the greatest strengths in bringing together a diverse set of stakeholders is the resources each brings to the table. By combining assorted individual perceptions of the problem and perceptions of the solution, the whole becomes more valuable than the sum of its parts. It is important to note shared resources refer to more than just pecuniary resources, non-tangible resources such as social capital, legitimacy, and institutional knowledge are also important resources stakeholders bring to the table. The sense of reciprocity associated with a high level of social capital promotes an atmosphere in that stakeholders will be willing to pledge a substantial amount of resources.

### Shared Vision

A shared vision of the problem and the potential solutions is essential to the efficacy of the collaborative. Dedication to the goals and scope of the effort often include a certain amount of adjustment to individual stakeholder's goals. Shared vision is one of the most vital elements in a collaboration. The vision must be broad enough to provide incentives for individual stakeholders while being within the scope of the collaborative effort. Once again strong leadership and high

social capital fuel the ability to create a broadly accepted shared vision among a diverse set of stakeholders.

### Social Capital

Entering into a collaborative effort with stakeholders you have already established social capital with can greatly reduce the initial stages, most collaborations must endure and allow the members of the effort to start addressing the primary issue at hand. In a collaborative effort lacking social capital in the implementation stage, it can take a great deal of time and effort to build effective working relationships.

In addition to social capital being a vital element to the implementation of a collaborative, newly formed social capital can also be viewed as an output of that effort. Increased social capital often results in the stakeholder widening their existing professional network and can lead to increased critical thinking and organizational problem-solving capacity as an added benefit of participating in a collaboration (Mayer and Kenter 2015; Morris et al. 2013).

### Trust

Trust is often thought of as the most vital element of collaboration. Without the presence of trust, stakeholders will be reluctant to taking any amount of risk in the name of the effort. Social capital and trust usually work in unison; relationships with high amounts of social capital are often found to have a great deal of trust. Building and maintaining trust is vital to a collaboration in all stages of the effort (Mayer and Kenter 2015; Morris et al. 2013).

## Conclusion

The multidisciplinary attributes of collaboration have led to lateral thinking in which ideas from many disciplines have been harvested and applied to wicked social problems. While this approach has added to the richness and complexity of ideas, it also has led to a great deal of ambiguity in crafting an agreed upon conceptual definition of collaboration.

The absence of a clear-cut definition of collaboration makes it difficult to identify and assess the success of collaboration. Defining collaboration has become a "Gordian knot" of sorts, easier to critique than truly disentangle. The multidisciplinary nature of the literature, while adding context and depth, further fragments general agreement on what collaboration is and what it is not. This entry highlights these challenges while presenting key models, frameworks, and the primary components of collaboration as identified through the vast multidisciplinary literature.

## Public Sector Employment and International Labor Rights: The International Labor Organization on Public Sector Workers

Susan Kang
John Jay College of Criminal Justice, CUNY, New York, NY, USA

Recent events have drawn attention to the tennous status of public sector unions. These include the 2011 protests in Madison Wisconsin and the 2016 *Freidrichs v. Calfornia Teachers' Association* case at the US Supreme Court. Because the only federal laws on public sector employees union and collective bargaining rights cover federal employees, public sector workers' union rights vary radically depending on their location. By union organizing rights, I refer to three basic collective rights for workers: the right to union and form trade unions, the right to engage in collective bargaining, and the right to engage in collective actions, including strikes, to protect their interests. In states such as Virginia, North Carolina, South Carolina, Tennessee, Texas, Alabama, and Mississippi, whole categories of public sector employees at the state and local employees are either explicitly forbidden or lack any laws regarding their collective bargaining rights. The right to strike is far more curtailed, as only a handful of states allow public sector workers the right to strike (and even only some public sector workers). For example, Alaska, California, Colorado, Hawaii, Illinois, Louisiana, Minnesota, Montana, Ohio, Oregon, Pennsylvania, and Vermont are the only states that allow teachers the right to strike, even though almost all other states recognized teachers' rights to collective bargaining (Sanes and Schmitt 2014).

It appears most public sector workers in the United States do not have strong protections of their union organizing rights. Even if state and local employees are granted some statutory protections around union membership and collective bargaining, many lack the right to strike or engage in any kind of workplace action (such as New York state employees under the Taylor Law). However, from an international perspective, these states are likely in violation of international human rights law. Although most Americans do not consider labor rights within the purview of international human rights, there is a comprehensive collective of international treaties and jurisprudence on the subject of public sector union rights. Most of these protections are associated with the International Labor Organization (ILO), a specialized agency of the United Nations that focuses on workers. According to these laws and norms, public sector employees, regardless of what state they are located in, deserve the three basic union rights (with some very qualified exceptions). In recent years, American trade unions in the US South have begun to use the ILO as a strategy to promote union rights for public sector workers lacking such statutory protections.

This entry discusses US public sector employees in an international human rights context. It will focus primarily on the International Labor Organization promotes the rights of public sector workers through their conventions, resolutions, and various governance bodies. This entry will also focus on the decisions of the Committee on Freedom of Association, which has made many relevant recommendations on the collective bargaining rights of public sector workers in a number of challenging contexts, including during times of austerity and state budget pressures, an issue that has led to the curtailing and limiting of collective bargaining scope in various US states.

### The USA and the International Labor Organization

The International Labor Organization is a specialized agency of the United Nations focusing on the promoting decent work and social justice. It is

unique in its tripartite structure, as it includes representatives from governments, employers, and workers' organization. Unlike most other UN specialized agencies, the ILO precedes the UN. It was created in 1919 as part of the Treaty of Versailles, and its mission reflects the "functionalist" logic of the times. In other words, the ILO was seen as a body that would help promote peace by promoting social justice within countries, making future conflict and war less likely. After the end of World War II, the ILO was incorporate into the UN system. Over 95 years, the ILO has assembled a body of international hard and soft law on workers and work-related topics. This includes both public and private sector workers and issues such as migrant labor and irregular work.

The ILO's relationship with the United States has been a tenuous one, reflecting the United States' generally contentious relationship with the United Nations. While the United States has been a member since the ILO's inception, and American trade unionists such as Samuel Gompers were prominent members at its creation, the United States has not ratified many conventions. In addition, the United States actually left the ILO in 1977, under the leadership of the Jimmy Carter presidency. The exact reasons for the departure are related to various political concerns, particularly Cold War and related security conflicts (Beigbeder 1979, 227). However, the United States did return to the ILO in 1980 after negotiations with ILO leadership (Linsenmayer 1980). The United States regularly contributes a significant amount to the ILO's operating budget (about $89 million in 2014 or 22% of the ILO's regular budget biennium), as well as being the "single-largest donor of ILO extra budgetary technical cooperation projects" with $34 million in funds provided in 2013. The United States is also a member of the governing body and maintains a presence at the ILO through the Department of Labor' Bureau of International Labor Affairs, participating in the ILO Governing Body meetings and the annual International Labor Conference (International Labor Organization 2016a; USA Department of Labor, Bureau of International Labor Affairs, 2016). Yet despite its financial contributions and active participation, international relations scholars generally agree that the US status as a global superpower has rendered it relatively unbothered by the ILO's decisions and activities that may counter US interests.

In fact, the United States has long had a contentious relationship toward human rights treaties in general. Following the creation of the Universal Declaration of Human Rights in San Francisco in 1948 (of which Eleanor Roosevelt played a pivotal role), the USA' security concerns of the early Cold War frustrated most attempts at ratifying key international human rights treaties. The debate surrounding the political appropriateness of US ratification of these treaties led to the "Bricker Amendment," suggested constitutional amendments that would curtail the effects of international human rights treaties and other executive agreements. The Bricker Amendment was a series of suggested amendments created in the 1950s, and while none of these proposals were adopted, the discussions over them halted Senate approval of the key international human rights treaties, including relevant international labor convention ratifications. Section 2 of the 1953 version of the Bricker Amendment read:

> No treaty shall authorize or permit any foreign power or any international organization to supervise, control, or adjudicate rights of citizens of the United States within the United States enumerated in this constitution or any other matter essentially within the domestic jurisdiction of the USA. (Kaufman and Whiteman 1988, 315)

As a result of the anti-international sentiment in the early Cold War period, the United States remains reluctant to ratify key human rights documents, although it often signs such treaties and its representatives make significant contributions to treaties in the negotiation stage. Currently, the United States has ratified only a few international labor conventions, the labor rights treaties negotiated under the authority of the International Labor Organization. Of the ILO's eight "fundamental conventions" (which cover the following rights: freedom of association and the effective recognition of the right to collective bargaining, the elimination of all forms of forced or compulsory labor, the effective abolition of child labor, and the elimination of discrimination in respect of employment and occupation), the USA has only ratified

two: abolition of slavery (Convention 105) in 1957 and Worst Forms of Child Labour Convention (Convention 182) in 1999 (International Labor Organization 2016b, 2016c). The key international labor convention on public sector employees is Convention 151, the Labour Relations (Public Service) convention, created in 1978. This convention expanded union rights to public sector workers, in light of the expanding size of public services in many countries.

## The US Obligations to ILO Conventions on Collective Bargaining

Notably, the USA has not ratified the key union rights international labor conventions, conventions 87 and 98. These conventions, Convention 87 Freedom of Association and Protection of the Right to Organize Convention and Convention 98 Right to Organise and Collective Bargaining Convention (hereby referred to as C87 and C98), protect the right of workers to join organizations and the right for those organizations to engage collective bargaining and other collective actions to promote their interests, respectively (International Labor Organization 2016d). As these are the fundamental "enabling" rights for workers, meaning that they are the rights that help workers to build their own power and influence vis-à-vis employers, the ILO decided in 1951 to create a very open committee to reviewing complaints from workers (or employers) organizations about violations of these rights, regardless of the country's ratification status. This is justified because the ILO argues that all member states are obligated to respect, promote, and realize principles of Freedom of Association (found in the relevant conventions) by virtue of their membership. The Committee on Freedom of Association (hereafter referred to as "the Committee") is housed under the ILO's governing body and has an independent chairperson and three representatives from governments, employer organizations, and worker organizations. The Committee reviews complaints, requests information from the relevant state government, establishes the relevant facts, and determines whether the case constitutes a violation of freedom of association principles (the union rights discussed above). If the Committee determines that a violation has occurred, then the Committee makes recommendations to government with remedies and requests information about implementation of these recommendations (International Labor Organization 2016d).

The Committee has no power to force states to adopt their recommendations, but it is arguably an institution with some influence and legitimacy. Since its history, it has received and evaluated over 3000 cases from countries on every region. The Committee claims that over 60 countries in 5 continents have followed its recommendations and shared information about relevant progress on union organizing rights in the past 35 years (International Labor Organization 2016d). Research demonstrates that the Committee has had some positive effect in improving union rights in a number of high profile cases (Gravel et al. 2001, 24).

While the measurable effects of the Committee on FOA are debatable, the Committee is widely understood to be the global authority on workers' union rights. Therefore, 60 plus years of decisions and recommendations serve as a useful guide on developing international standards on workers' human rights. Many of the cases brought to the Committee have involved disputes over public sector workers' collective bargaining rights. The Committee relies on its established principles, past decisions, and other ILO conventions to guide its evaluation of complaints. Therefore, the ILO Committee's decisions provide a better guide into international norms on public sector union rights than ILO Convention 151, which is very general and recaps many of the principles of Convention 98.

We can find the Committee's established principles regarding public sector workers in its "Digest of Cases," last published in 2006. In this publication, the principles regarding all aspects of union rights are carefully elucidated. In regard to public sector workers, the Committee has created the following standards. All public sector workers, "without distinction whatsoever," have the right to create and join trade unions (not just

substitute association), without prior authorization, to protect their interests. The only possible exception is the police and armed forces, which would fall under relevant national laws. The Committee has specifically recognized the rights of the following occupations: civilian staff in the armed forces (including Army Bank), local public service employees, firefighters, prison staff, customs officials, teachers, and embassy personnel. The Committee has also recognized that the broad range of public sector workers, including white-collar workers, have the right to collective bargaining, other than those "engaged in the administration of the state" which the Committee defines as public servants employed in government ministries and similar bodies (International Labour Office, and Freedom of Association Committee 2006, 886, 887). (The Committee has been more conservative in its interpretation of strike rights for many public service workers, arguing that the right to strike may be reasonably curtailed in various public and essential services, but should be done in a way that respects basic freedom of association principles.) (Gravel et al. 2001).

The collected decisions on various labor organizing rights disputes are not legally binding and lack the force of law of a human rights treaty. However, the Committee's recommendations can be considered soft international law – similar to UN General Assembly resolutions or other types of less institutionalized international agreements (Abbott and Snidal 2000). As a result, the Committee is a leading international authority on workers union organization rights, but its decisions are merely a tool for advocates who seek to promote greater respect for public sector union organizing rights. Various political factors can make the Committee's recommendations more or less influential on a country's labor practices (Caraway 2006; Kang 2012). In general, international human rights organizations often do not have much influence over the USA because of its superpower status. However, US unions and other organizations use the ILO and other international actors as part of broader political campaigns to challenge existing laws. One case of possible success was case 2292 (2003), in which the American Federation of Government Employees complained to the ILO Committee about the lack of collective bargaining rights for newly created TSA (Transportation Security Administration) workers. Under President Obama, TSA workers were granted collective bargaining rights. It remains unclear whether ILO consultation and recommendations mattered more than partisanship of the executive branch.

## Applying International Standards to the USA

As mentioned earlier, the US government generally does not feel vulnerable to critical decisions by international human rights organizations, including the ILO Committee on Freedom of Association. Yet the US failure to adequately protect union organizing rights for many of its public sector employees has been brought to the ILO Committee's attention in recent years. The ILO Committee evaluated two cases, Case 2741, which involved the prohibitions against any public sector work actions as written within the Taylor Law in New York State, and Case 2460, which dealt with the lack of collective bargaining rights for public employees in North Carolina. In both of these cases, the Committee found the practices in question to violate international union organizing rights. However, in both cases, the legal provisions have not yet changed.

## Case 2460

Case 2460 dealt with the lack of collective bargaining and union recognition rights for public sector workers in North Carolina, where the independent union electrical workers (UE) had been organizing and mobilizing public sector workers for years, especially in North Carolina, which has no statutory provisions for public sector collective bargaining. UE Local 150, a constituent unit, represented a variety of public sector workers in North Carolina, including "janitors, refuse-disposal workers, housekeepers, groundskeepers, medical technicians, bus drivers and other vital municipal and state employees," most of whom were women and people of color. Under North Carolina's General Statute (NCGS) §95–98, no public sector employees had a right to engage in collective bargaining, of any kind of negotiation,

with the state of North Carolina, and Case 2460 argued that this law violated the US obligations to international standards on union organizing rights. The complaint further included information about failed legislative and legal attempts to challenge North Carolina's laws (International Labor Organization 2007).

As a result of the prohibitions, the UE argued that public sector workers in North Carolina suffered from many problems. These included such issues such as "miserable working conditions," health and safety violations, poor wages, and a lack of grievance and appeals for workers. Most notably, the complaint argued that there was widespread racial and sexual discrimination within the workplace, which resulted in wage differentials that were confirmed by the state's own reports. This resulted in a clear lack of women and African–Americans within management and professional positions. Thus, the UE urged the Committee to recommend that the United States uphold its international obligations to protect collective bargaining rights, even though the USA had not ratified Conventions 87, 98, and 151 (International Labor Organization 2007).

The US government responded in a way that both confirmed the importance of labor organizing rights but also shielding itself from responsibility. In its communication in November 2006, the government stated that "the United States respects, promotes and realizes the fundamental principles and rights at work that are embodied in the ILO's Constitution, and is in full compliance with any obligations it may have by virtue of membership in the ILO." Since all North Carolina public employees could form associations, and had various rights such as nondiscrimination and other federal protections, the US obligations were fulfilled. But at the same, the United States claimed that since it had not ratified relevant conventions, it had no obligation to follow the standards in Conventions 87, 98, and 151. Citing recent court decisions, the USA argued that the ability to form associations was the extent of North Carolina public sector employees' rights, as the Constitution does not create any obligation for any parties to create contracts with each other, but rather left it up to the democratically elected representatives of every state to decide. Workplace concerns could also be informally addressed through the citizen–legislator relationship. The US government also argued that the UE had done an effective job advocating for public sectors in the state, including a recent pay raise, demonstrating that a legal collective bargaining right was unnecessary. Thus, the US government attempted to both affirm ILO principles and deny any domestic obligations, stating:

> While the people of North Carolina, through their elected representatives, have decided that their state and local governments may not enter into collective bargaining agreements, North Carolina's public employees and their unions retain the right of freedom of association and the right to participate in democratic processes at the local, state and federal levels by engaging their governments in free and open discussions about public sector work–life issues and about collective bargaining itself. Thus, there is no ground upon which to question the Government's commitment to the fundamental principles upon which ILO membership is based. (International Labor Organization 2007)

The ILO Committee on Freedom of Association responded to the information provided in favor of the complainants, finding this case to constitute a violation of key principles of Freedom of Association. The Committee noted the information provided by the government, including the protection of worker's basic freedom of association within the constitution, as well as the US commitments to ILO principles. However, the Committee found that the existing provisions, including the democratic right for public sector workers to discuss their job related concerns with public authorities and legislators, were insufficient. To merely provide a right to join unions would be meaningless, according to the ILO, since the main reason workers join unions is to engage in collective bargaining. Thus, the Committee argued that the lack of any legal provision for North Carolina violated international labor standards. The Committee stated that: "it is imperative that the legislation contain specific provisions clearly and explicitly recognizing the right of organizations of public employees and officials who are not acting in the capacity of agents of the state administration to conclude collective agreements" (International Labor Organization 2007; Compa 2012).

As a result of this decision, UE Local 150 and the national UE heavily publicized the ILO's favorable decision. This became a major rallying point for the union, included in many of its political arguments to challenge the legitimacy of North Carolina law NCGS § 95–98 (UE 150 2016). While the ILO Committee's condemnation of North Carolina's law did not create any automatic changes nor penalties for the United States, the United States continued to respond to requests for further information. In a 2009 communication, the government reported that the North Carolina General Assembly was considering several bills regarding the appeal of NCGS § 95–98: Public Safety Employer–Employee Cooperation (House Bill 1651), Restore Contract Rights to State/Local (House Bill 750 and Senate Bill 427), and Repeal Ban GS 95–98 (Senate Bill). The EU had helped to introduce these bills (International Labor Organization 2010). However, those bills did not progress from committees, and in 2014 the case was considered closed (International Labor Organization 2014). While the legal changes remain elusive, UE 150 continues to organize, mobilize, and engage in political work, including "meet and confer" with public authorities about members' working conditions in North Carolina.

### Case 2742

Case 2742 was filed by Local 100 of the Transportation Workers Union, the union that represents the workers of the New York City transit workers. In December 20–22, 2005, the 38,000 members of the TWU went on strike in response to poor faith negotiations over a new contract. The major points of contention included pensions schemes for new members and health-care benefits. The TWU went on strike with the full knowledge that they lacked the legal right to strike, as the Public Employees' Fair Employment Act of 1967 (Article 14 of the New York Civil Service Law), or the "Taylor Law" does not allow for any concerted work activity (from a "sick-in" to a slow down strike, or work stoppage) and mandates arbitration in the cases of a bargaining impasse. In addition, the Taylor imposes strong punishments on unions and union leadership for participation in concerted work stoppage. While the strike ended within three days, the New York courts found the union to be in criminal contempt. In April 2006, the court fined the TWU $2.5 million and fined each striker two days' wages for each day of the strike. Furthermore, Local 100 lost its right to automatically deduct dues from member's paychecks ("check off"). The president of Local 100 was sent to prison for 10 days for his violation of the Taylor Law. Thus, the TWU and Local 100 requested that the ILO recommend that the United States change the Taylor Law to conform with international standards (ILO 2011).

As governments also respond to ILO complaints, the US federal government responded the TWU complaints. The United States responded to the ILO's request for information that as a federal system, states had the right to determine their own laws, stating that "labour laws in each state reflect the balance of employer and employee rights that has been struck by each state's governing bodies." Furthermore, New York state employees already had generous public sector collective bargaining rights and currently enjoyed one of the highest unionization rates in the country, of 24.2%. Even though New York state employees could not strike, the government's response pointed out the PERB (Public Employment Relations Board), a state agency that provided a means for dispute resolution and fact-finding for unions and public authorities. It did not deny or contest whether the Taylor law violated ILO norms, but instead discussed the importance of the federal democratic system and that federal level employees had certain collective bargaining rights protected.

In response to this case, the ILO Committee argued that the Taylor Law violated the principles of "freedom of association." While recognizing the United States had a federal system, the ILO Committee "nevertheless requests the Government to take steps aimed at bringing the law into conformity with freedom of association principles" which could include creating a standard of minimum services in the case of a future work stoppage. In an October 2012 response, the US government stated that it had contacted the New York State attorney general to "explore potential avenues for response to the Committee's

decision" (International Labor Organization 2011). In 2014, the government sent a communication to the ILO Committee regarding a bill at the New York State Legislature that would amend the Taylor Law's punishments for striking workers, Assembly Bill A3922 (International Labor Organization 2014). The case was considered closed after this, although as of 2016, there have been no such amendments to the Taylor law.

## Conclusion

As mentioned earlier, ILO Committee recommendations do not automatically lead to changes in laws and practices. However, even in powerful and less vulnerable countries like the United States, the complaint system has had some effect in public sector union organizing rights. First, participation in the complaint process is elective, and while the ILO Committee requests information from member states, governments do so voluntarily. Second, while there have not been successful legislative reforms in either New York or North Carolina, there was legislation introduced in both states in response to the complaints (Givan et al. 2010). While the bills did not progress in either state, international law had a demonstrated effect on domestic political practices and helped to legitimize the union's positions to their members and allies.

International law on union organizing rights often seems distant from the everyday experience of public sector workers in the United States, especially for those in states with strong limits or outright prohibitions on these rights. However, given the political importance of human rights within this period of anti-union sentiment, American public sector unions have used international human rights tools with varying levels of success. International standards remains peripheral, but with the increasing public attention to other aspect of the United States' exceptionalism on many other policy issues (such as universal health care, parental leave, paid holidays), it is possible that international and comparative standards may become more relevant to public employment labor relations in the future.

# Public Sector Entrepreneurship

Mehmet Akif Demircioglu[1],
Farzana Chowdhury[2] and Roberto Vivona[1]
[1]Lee Kuan Yew School of Public Policy, The National University of Singapore, Singapore, Singapore
[2]Department of Management and Marketing, Durham University Business School, Durham, UK

## Synonyms

Innovativeness; Pro-activeness; Resources; Risk-taking

## Definitions

Creation or extraction of public value; the activity of managing a public organization with taking initiatives or risks to improve or solve government or public problems; seeking an opportunity and extra-role behavior to serve society and government; running or managing an organization with an initiative and risk-taking; recognizing and exploiting the opportunity to provide services to publics; combining organizational capability and resources to exploit an opportunity to provide new or improved services to citizens.

## Introduction

Entrepreneurship has become a buzzword in our society. Many organizations and individuals consider their organizations or themselves as entrepreneurs. Entrepreneurship is seen as a positive phenomenon and is a popular topic. Many academics, policymakers, and practitioners are interested in entrepreneurship. For example, a simple Google Scholar search yields over 2,000,000 studies on entrepreneurship (As of June 1st, 2020). However, there are only 1,640 results when we search "public sector entrepreneurship (As of June 1st, 2020)." These findings demonstrate that entrepreneurial activities mostly focus on the private sector, or the firm rather than the public sector, or the government. However, public sector entrepreneurship (PSE) has gained the attraction of scholars and has become a hot topic in recent years. There is a growing interest to understand PSE indicated by the 609 research output (out of 1,640) since 2016 (As of June 1st, 2020). In other words, 37% of studies on PSE are published in the last 4.5 years.

Despite the growing interest in the PSE, PSE still lags behind private sector entrepreneurship research. The important reasons behind this scarcity of research on PSE are that entrepreneurship is considered a profit-maximizing activity, while public organizations do not have this mission. In addition, as public organizations are typically funded by tax payers' funds, it may not be logical to risk or "waste" the budget to a product or service that may fail. Moreover, funding constraints, organizational structure as public bureaucracy are typically hierarchical, risk-aversive, complex, subject to a red tape due to

accountability and scrutiny mechanisms, and has less market exposure, so there are claims that entrepreneurial activity in public organizations and among the public sector employees are low compared to the private sector (Bozeman and Kingsley 1998; Morris and Jones 1999; Özcan and Reichstein 2009; Swann 2017). Therefore, it is important to differentiate PSE from private entrepreneurship because "there are significant differences in organizational realities, suggesting that the goals, objectives, constraints, approaches, and outcomes associated with successful entrepreneurs are unique in public sector organizations" (Kearney et al. 2009, p. 28).

The rest of the chapter is organized as follows. In the next section, we will look at the history of PSE; then in the following section, we present various definitions currently proposed by the scholars, and examine how PSE differs from private entrepreneurship. Then we present various successful PSEs. Our chapter ends with a conclusion.

## Brief History of PSE

PSE gained the interest of the governments in the 1980s, the beginning of New Public Management (NPM) in the United Kingdom, Australia, and New Zealand than in the United States in the 1990s during the reinventing government movement (Clinton and Al Gore administration's National Performance Review movement). All of these reforms were geared toward encouraging public organizations and public sector employees to be entrepreneurial (Bernier and Hafsi 2007; Hayter et al. 2018; Osborne and Gaebler 1992; Osborne and Plastrik 1997; Windrum and Koch 2008). The objective of NPM was to empower managers. The motto of NPM "let the managers' manage" is associated with PSE by allowing managers to manage, and by doing so, they can help governments' to behave entrepreneurially (Bernier and Hafsi 2007). Swann (2017, p. 544) summarizes these developments cleverly:

> Traditional public administration indeed had little room for entrepreneurship with rigid rules, strict hierarchy, and narrow focus on internal procedures. But the advent of NPM, the reinventing government movement, and Moore's (1995) PVM ushered in a new era in which public managers were expected to not only act more like private managers and autonomously "manage for results" but also, and more broadly, think "imaginatively" and behave entrepreneurially to create public value in an increasingly networked governance world.

## What is PSE?

As the name suggests, the term public sector entrepreneurship (PSE) has two concepts: "public sector" and "entrepreneurship." PSE aims to combine these two concepts. The public sector refers that an organization that is funded, owned, and controlled by governments (Bozeman 2004; Rainey 2009). Employees working in the public sector are typically called civil servants or public servants. Researchers typically exclude employees working in public hospitals and public schools from the classification and include employees working in the departments/ministries or state or local governments are considered public sector employees (Arundel et al. 2019; Vivona et al. 2020). For the second concept, Howard Stevenson defines entrepreneurship as "the pursuit of opportunity beyond resources controlled" (Eisenmann 2013, no page number). Entrepreneurship refers to exploration and exploitation of the environment (Klein et al. 2010; Shane and Venkataraman 2000).

Therefore, PSE – a combination of the public sector and entrepreneurship – can be defined as the pursuit of opportunity, exploration, and exploitation activities in the public sector. More specifically, there are several definitions offered by different studies. The earliest definitions of PSE were offered by Wagner (1966) and Ostrom (1964). Wagner (1966) viewed PSEs as operators providing services or collective benefit for political gain. Ostrom (1964, 2005, p. 1) viewed PSEs who changed market environment to influence the behavior of the private sector entrepreneurs, "...form of leadership focused primarily on problem-solving and putting

heterogeneous processes together in complementary and effective ways." Most recently, Hayter et al. (2018, p. 689) defined PSE as "actions that are innovative, that transform a status quo economic environment, and that are characterized by uncertainty." Demircioglu and Chowdhury (2020, p. 3) defined public sector entrepreneur as follows: "to achieve an organization's objective, an employee works beyond what is required in his/her job, goes the extra mile, and suggests ideas or policies that improve how the organization and its members work." According to Swann (2017, p. 544), public sector entrepreneurs are the visionary individuals or organizations that operate within an environment of uncertainty and identify and take opportunities to innovate and create value with the intent of attaining some reward, praise, recognition, and/or self-fulfillment." The following section will explore some important studies on PSE.

## Research on PSE

Studies on entrepreneurship, including the private sector (the most studied), the public sector, and the nonprofit sector, focus on three views: organization, such as type and age of the organization; behavior, such as individuals' and organizations' tendency to search and explore opportunities, their innovativeness, risk-taking, and pro-activeness; and performance such as whether entrepreneurship activities (entrepreneurship behavior) increase the tendency to survive to prosper and perform well (Audretsch and Link 2018, 2019; Audretsch et al. 2020; Leyden and Link 2015). Similar to private and corporate entrepreneurship, PSE occurs in all levels of an organization – individual level, organizational level, and interorganizational level. According to Audretsch et al. (2020), the second view (behavior) is most relevant to entrepreneurship scholarship from a management and business perspective since both, individuals' and organizations', behavior, influences capability building of an organization and vice versa.

Like the private sector or corporate entrepreneurship, PSE includes risk-taking, innovativeness, and pro-activeness (Kearney et al. 2009; Kim 2010; Moon 1999). Business research considers these three characteristics as entrepreneurship orientation (EO) of firms (Covin and Miller 2014; Covin and Slevin 1989). In addition to innovativeness, risk-taking, and pro-activeness, both the private entrepreneurship and PSE also entail opportunity recognition, flexibility, vision, rewards (financial or nonfinancial) (Luke et al. 2010), and access to resources (Barney 1991).

While entrepreneurship in the private sector typically focuses on maximizing profit, increase stakeholder shares, and extend the firms' product and services, PSEs have broader social goal including regional or national economic development, solving social problems, and dealing with grand challenges such as poverty, migration, along with the sustainability of the organization and its resources (Itami and Roehl 1987; Klein et al. 2013). Therefore, PSE can help governments reduce market failures with innovative and creative solutions (Audretsch et al. 2020). Political leaders are interested in promoting PSE because doing so can increase governments' performance (Moon 1999).

According to Bernier and Hafsi (2007), PSE evolves from individual entrepreneurship (e.g., Roberto Moses) to systemic entrepreneurship because society, organizations, and the external environment are changing, and organizations are institutionalized (e.g., a large number of individuals have become entrepreneurs as creativity is acknowledged and encouraged and individuals can make some decisions). Therefore, instead of certain individuals, organizations, and a large number of people are expected to behave entrepreneurially. As Bernier and Hafsi (2007, p. 499) state

> systemic entrepreneurship "seems to come about more easily when organizational creativity is legitimized and contributions to this creativity are acknowledged. In such cases, entrepreneurs are people who know how to breathe new life into organizations haunted by selfdoubt. Innovators can take advantage of the opportunities they are offered to make positive contributions to developing the organization and the larger decision space that thereby becomes available.

## Successful PSE Examples

This section illustrates three recent and emblematic cases that present germane theoretical interest to the evolution of individual PSE into organizational and systemic change. A first paradigmatic example is the *de-managerialization* of local authorities in the Netherlands, i.e., the transition from traditional and hierarchical bureaucracy to employees' empowerment and self-management (https://oecd-opsi.org/innovations/self-managing-teams-in-nijkerk-municipality/). This practice proved beneficial in the private sector (see Kirkman and Rosen 1999; Shipper and Manz 1992), as promoting employees entrepreneurship allows organizations to be more productive and flexible to the changing environment; nonetheless, it has only recently been applied to public sector organizations. This PSE case originated in Nijkerk municipality, where employees proposed to implement a "bulletin board" to match unoccupied public servants with unresolved or complicated tasks, to optimize response timeliness through improved time management. Employees strongly committed to the initiative, to the point that both the municipal council and executives decided to support the new working method and embed the change into the organization, resulting in the formation of 28 self-managing teams, each with its plan and managerial responsibilities. This is an example of bottom-up PSE, where employees' innovativeness drives systemic change in the organization, consistent with Bernier and Hafsi's (2007) claim that PSE can be systemic and many employees can be entrepreneurs.

Another case, which provides an exemplary top-down PSE, is the initiative promoted and championed by the Mayor of San Francisco in 2016, which aimed at creating public value by enhancing living standards through improved service delivery (https://oecd-opsi.org/innovations/the-mayors-fix-it-team/). In order to address citizen needs, the mayor formed a "fix-it team," which operated in five phases: (i) gathering data through community surveys and analyses of police data; (ii) mapping of "fix-it zones," i.e., areas concerned with poor quality of life; (iii) validation of the zones, by physically walking the areas with relevant stakeholders (e.g., citizens, agencies); (iv) creation and implementation of an action plan for each zone; and (v) sharing feedbacks with residents. The fix-it team played a major role in creating transparency, learning, and multilevel and multiagency partnerships, which are relevant to address social issues. This allowed San Francisco municipality to change the way citizens are listened to and secure rapid and effective delivery of public services in troubled zones.

Moving from municipalities to higher levels of government, a promising PSE case is represented by the Global Innovation Policy Accelerator (GIPA) (https://oecd-opsi.org/innovations/global-innovation-policy-accelerator/; https://www.nesta.org.uk/project/global-innovation-policy-accelerator/), a cross-national partnership program between several developing countries (such as Chile, Colombia, Mexico, Peru, Brazil, India, and others) and a consortium of UK innovation experts, including public agencies (e.g., Nesta, Innovate UK) as well as universities (e.g., Oxford, Manchester). The aim of the program is the creation of an international network of policy entrepreneurs to share and adopt best practices and to promote systemic change. Piloted in 2017, the program built on shared expertise to undertake a pioneering project of bringing in various Latin American countries' innovation policy into diplomatic agenda, in order to further enhance cross-national collaboration. Deemed by participating partners as a successful experience, GIPA institutionalized its function toward building and developing innovation capacity in government organizations, that is, it aims at empowering government in developing countries in pursuing public sector innovation. This change has been embedded into a revised version of the program which is now under evaluation. This example demonstrates that innovation and entrepreneurship are highly related, and innovation can occur through entrepreneurial action and behavior (Audretsch and Link 2019; Hayter et al. 2018; Leyden and Link 2015; Leyden 2016).

## Conclusion

What we know about PSE is growing thanks to increasing studies focus on the public sector. Despite diverse conceptualizations, we defined PSE as the pursuit of opportunity, exploration, and exploitation activities in the public sector. Research on PSE assessed the evolution from individual entrepreneurship to systemic. The presented successful cases show that PSE usually originates as individual entrepreneurship (of a single person – a Mayor, a single group of employees, or a single organization), and its success can be evaluated to the extent individual efforts are recognized and embedded in systemic change. The cases also exemplify cardinal characteristics of PSE presented in previous sections of the essay, such as the importance of innovativeness, risk-taking, and proactiveness, opportunity recognition and exploitation, flexibility, vision, rewards, and access to resources. Overall, PSE is worthy of research thanks to the broader public interest from citizens and politicians and making public organizations perform better, serve the citizens more efficiently and effectively, and create public value (Bernier and Hafsi 2007; Luke et al. 2010; Moore 1995).

## Synonyms

Expatriation; International assignments

## Definition

A public sector expatriate is an employee who is sent abroad by their organization, for an organizational mission, for a precise period of time, and expected to return to their home organization, in their home country, after that time. When the assignment abroad lasts less than 1 year, we usually speak about short-term international assignment.

## Public Sector Expatriation

Public sector organizations have a long tradition of sending personnel to other countries for a variety of purposes, such as diplomatic and military service (Groeneveld 2008). Indeed, they have been doing this as long as countries as such have existed – even before then rulers were sending their armies into other rulers' territories. Nowadays, the number of public servants working as **expatriates** (i.e., living and working outside their own countries for a time-determined period) seems to be continually increasing (Midura 2008).

Despite this long history, research attention to issues of expatriation and the problems of managing expatriates has been almost entirely conducted in the private sector among multinational companies (MNCs). Research on public sector

expatriates and their unique working conditions is scarce (Fenner and Selmer 2008; Fisher et al. 2015; Green 2012; Groeneveld 2008; Selmer and Fenner 2009). The situation of expatriates in the public and private sector has both similarities and differences. There is a need for more attention to be paid to the situation in the public sector.

In this section of the encyclopedia, we:

- Outline the different elements of the public sector that have expatriates.
- Discuss the main differences between expatriation in the private and public sectors.
- Outline some of the key issues in public sector expatriation.
- Draw some conclusions.

## Different Parts of the Public Sector Using Expatriates

Public servants who may get posted to other countries can be summarized under three main headings:

(i) **Government expatriates: armed services**. Nearly all governments around the world have armed services pledged to defend the country against foreign enemies. This often involves active service in another country or spending time in another country as part of liaison with allies (Fisher et al. 2015). For the military, foreign postings are an integral part of their military career; they join expecting them to happen (DoA 2010). During a time of war, military personnel are generally unaccompanied by spouse/family when deployed and are rotated out of a combat setting every 12–18 months and returned home due to the psychological and physical demands of serving in an area under "hostile fire or imminent danger" (Fisher et al. 2015).

(ii) **Government expatriates: diplomatic services**. More common are the nonmilitary expatriates that the public sector sends to represent them in other countries or even to other organizations. These are generally referred to as the diplomatic service, although increasingly these include civil servants responsible for business, for science, or for public relations issues. For most, but not all, of these people too, service in another country is part of a normal career path and is expected.

(iii) **Intergovernmental organizations**. The third group of public sector expatriates are those who work for the intergovernmental organizations (IGOs) such as the United Nations, the European Union, or a wide variety of scientific and trade bodies run by numbers of countries jointly (Toomey and Brewster 2008). Some of these employees are seconded from their national governments' armed or civil service. Most are "self-initiated" expatriates (Suutari and Brewster 2000) who have applied to join one of these organizations from their own country and then started work at the Headquarters of an IGO or in one of its regional or national offices.

## Main Differences Between Expatriation in the Private and Public Sectors

From this brief outline, it should be clear that there are a number of similarities and differences between public and private sector expatriates.

The similarities include the fact that all expatriates, from whatever sector, are spending time away from their base and their home country and living temporarily in another country. Both would normally take their nuclear family with them. Both tend to live in major cities where expatriates are common or in camps surrounded by other expatriates (Lauring and Selmer 2009). Common to both the private and public sector expatriate are the careful selection, the importance of preparation, the stress of moving, the need to adjust and perform in a foreign context, the uncertainty about the subsequent job, the challenging situation of partner and children (where families are involved), and the existence of rewards.

There are also key differences between public sector servant expatriates and private sector expatriates. For the private sector employees in MNCs, expatriation is sometimes a typical part of their work, if they are technical specialists, but is more often a one-off event and a significant factor marking them out as key "talents" with serious possibilities of moving up the career ladder (Cerdin and Brewster 2014). They will be generously rewarded for this unusual event. For relevant public sector expatriates, moving to another country is built into their contract and their pay and rewards are "international." Although they will receive significant emoluments for their time abroad, these are much lower than those available for private sector expatriates. Furthermore, these public sector expatriates are not moving from "home" to abroad – many of them (especially in the IGOs) are not based in their home country anyway. Many of the governmental expatriates are on regular rotations that means they may be at "home" for only brief periods in between assignments.

The rest of this section explores the issues that are peculiar to public sector expatriates, because of the nature of public sector work and employment. We follow the "expatriate cycle" (Waxin 2007) and consider recruitment and selection, the role of partners and families, location, preparation, adjustment, performance, rewards, and repatriation.

## Key Issues in Public Sector Expatriation

### Recruitment and Selection

Whereas in the private sector expatriates are usually selected from within the existing workforce, in the public sector expatriates are people who have signed up to a career that they know may involve international transfer. In all three parts of the public sector, employees are selected after careful screening and their contracts include an international mobility clause. Foreign assignments in the military are often of a multiple short-term character (Crowley-Henry and Heaslip 2014). In the diplomatic service, they are typically assignments of 3 or 4 years' duration. The different contractual arrangements between private and public sector expatriates mean that levels of commitment and motivation may differ (Fenner and Selmer 2008; Fisher et al. 2015; Selmer and Fenner 2009) in that public sector expatriates in effect select themselves for foreign postings in the course of applying for the job.

### Partners

The frequent and regular moves involved in a foreign service career can be difficult for employees and particularly for their families (Fisher et al. 2015). As a result, some diplomatic services now include partners in the assignment decision (Green 2012; Groeneveld 2008). Moving to new postings is taxing for expatriates in many ways, including physiologically (Anderzen and Arnetz 1999), but is particularly challenging for partners, who do not have the continuity of a position to anchor them and who are often expected to handle the practical matters of life in a new and different culture, such as grocery shopping and making appointments (Family Liaison Office Department of State 2008). They are usually prevented from working in the new country as they find it hard to get work permits (Groeneveld 2008). In the case of military short-term international assignments, partners staying at home may be under serious stress (Crowley-Henry and Heaslip 2014), so more organizational support is needed.

### Location

The extreme locational case is of course military expatriates who accept that their chosen career implies the possibility of relocation to dangerous and even life-threatening situations. Some members of the IGOs in the peacekeeping, refugee, food, and aid areas also find themselves in extremely risky situations; loss of life is all too frequent. For most of the diplomatic and IGO staff, dealing with local governments, their assignments are in more familiar big cities with related amenities. The culture of embassies, for example, may deliberately reflect the home

country rather than the host country, offering a supportive environment for the expatriates (Johnson et al. 2002, 2003). In many postings, expatriates may to an extent be isolated from the "foreignness" of the country through housing, separate utilities, and the provision of home equipment (Family Liaison Office U.S. Department of State 2008; Green 2012). As a result, they may in some cases have little interaction with locals other than the country's educated, and often westernized, élite.

Military families know that they may get sent abroad again, but where will depend on the exigencies of national defense. The general rule in the diplomatic services is that service in an attractive location (e.g., a European capital) is followed by duty back home and then in a less attractive city or one in crisis (maybe in Africa) and then back home, followed by a move to a more attractive location. There are few such rules among the IGOs, most of which are based in very pleasant, safe cities, and some people manage to stay in pleasant locations their whole careers. However, there are many people in such organizations working "in the field," and those IGOs that work in difficult and dangerous situations attempt to rotate people between such locations and headquarters. There is a widespread demand from governments for these organizations to base more of their employees in a wider range of countries.

### Preparation

The public sector is often better than the private sector in providing preparation for expatriates. Employees are often given additional training specific to the region to which they will be sent, including language training, cultural familiarity training, or political area studies (Honley 2005). The US Department of State, for example, offers several publications and classes to families with the aim of mitigating culture shock and maximizing successful adjustment (Green 2012). The US Department of Defense provides more extensive programs, although even here expatriates want more (Fenner and Selmer 2008).

### Adjustment

Expatriates' adjustment to their new role and environment is of great significance, both to the organization and to the managers themselves (Waxin 2004, 2006). There is a lot of research on expatriate adjustment in the private sector even if much of it is limited in explanatory power (Haslberger et al. 2013). However, there is much less work on the adjustment of public sector expatriates (Green 2012). Expatriates never fully adjust: it depends on the nature and location of their assignment how far they will, but in all cases, they know that they will be leaving that country soon and while they may become competent and able to operate well in the environment, they are unlikely to change their general view of the world. In general, diplomatic and IGO expatriates seem to suffer from less stress than private sector expatriates. The isolation of some public sector expatriates noted above means that they may have less motivation and less need to adjust to the local environment. Nevertheless, they will have to adjust their behavior to some extent to be consistent with the local cultural values in order to avoid offending locals and to be able to operate effectively in the country (Shin et al. 2007).

### Performance

Expatriate performance is less of an issue per se for public sector organizations than for private sector ones because as the transfer abroad is part of "normal" employment, there is little difference from everyday performance management. With little choice but to have such people (a diplomatic service or an intergovernmental aid organization could not act without expatriates), or with people operating in extreme conditions, and invariably with multiple and complex objectives, assessing performance is not easy. Mistakes, however, become very obvious and can have major consequences. "A higher weighting is assigned to the performance report of overseas service than to service at home" (Defense Force HRM report 2011).

### Rewards

Expatriates from the public sector get a significantly enhanced salary for working abroad, though the enhancements are often noticeably less than those in the private sector. For example, expatriates from the US public sector have quarters allowances, post or hardship differentials, and danger pay. The "quarters allowances" cover housing costs at the foreign location when no government-provided quarters are available (U.S. Department of State 2015). "Post or hardship differentials" are additions to pay commensurate with the hardship of the post to which the employee is assigned: more sophisticated and westernized cities may have no such extras, whereas in dangerous or difficult countries, it may amount to anything up to a third or more of basic pay (U.S. Department of State 2006a, para. 512). Some positions, where "civil insurrection, terrorism, or war conditions threaten physical harm or imminent danger," may also attract "danger pay" (U.S. Department of State 2006b, para. 652). In such cases, families would generally be expected to stay at home or in a nearby safe country.

### Repatriation

Returning home may be a big problem in the private sector, but it is one that public sector employees do not face. For example, there is "a definite position in the organization for all military personnel, therefore alleviating any concerns that jobs in the home country may not be available in the organization on return from an assignment" (Crowley-Henry and Heaslip 2014).

## Conclusion

Clearly there is a dearth of research into public sector expatriates. We need more information on the different types of international assignments in the public sector and more on how both short-term and long-term assignments are managed. There are millions of people working as public sector expatriates around the world. It seems that generally the management of expatriates in the public sector creates fewer problems than it does in the private sector, perhaps because expatriation is usually built into their contracts. Nevertheless, the difficulties that may arise as an expatriate and the difficulties in managing them are important and deserve greater attention.

### Synonyms

Citizen engagement; Code of Conduct Bureau; Corruption; EFCC; Ethical compliance; Ethics and values; Fiscal Responsibility Act; Good governance; ICPC; Integrity; Misconduct; New Public Governance; New public management; Public Complaint Commission; Public Procurement Act; Regulatory agencies; Responsibility vs. responsiveness; Service delivery; Social accountability; Sound administrative governance; Transparency

### Definitions

Governance – Good governance is not only about the further development of the rule of law and

democracy, but it also includes the elements of accountability and efficiency of the government (Addink 2019, p. 3–4).

Accountability – The most concise description of accountability would be "the obligation to explain and justify conduct" (Addink 2019, p. 159).

Responsiveness – Responsiveness is a procedural requirement for good government (Sharma et al. 2012, p. 954).

EFCC – It is an acronym of Economic and Financial Crimes Commission (EFCC)

ICPC – It means Independent Corrupt Practices and Other Related Offences Commission

## Introduction

The issues of governance, ethics, public service delivery, and outcomes for communities and countries are very central and critical to the study and practice of public sector administration and management in Nigeria especially in an era of heightened corruption and mismanagement. Public service ethical compliance (PSEC) measures and practices remain key to improving public trusts, values, transparency, accountability, responsibility, and responsiveness of the public officer (Thaler and Helmig 2015; Kumasey et al. 2016; Aitalieva 2018; Ijewereme 2018; Asamoah and Yeboah-Assiamah 2018; Okpata and Ukeje 2017; Beshi and Kaur 2019; Akosa et al. 2019) in engendering efficiency, effectiveness, and sound administrative governance and for the realization of sustainable development goals (Dansabo 2017; Ijewereme 2018; Ojo 2019; Ukeje et al. 2020a, b; Ndukwe et al. 2020) in Nigeria and other developing countries.

No doubt, for all democratic nations, a certain degree of distrust is inevitable (Kettl 2018). This is because diverse societies face a greater challenge in attempting to enhance public trust (Houston et al. 2016). However, any bureaucratic reform policies that increase citizens' trust developed in one country are equally suitable for other countries (Houston et al. 2016). However, the way government addresses citizen distrust is of great consequence (Kettl 2018). Given that the citizens are no longer tolerant of abuses of public trust and of the malfeasance of the past, they expect accountability and transparency (Brinkerhoff 2000; p. 239). The purpose of this chapter is to provide an additional insight on the relationships among public service ethics (PSEs), citizen-centered service delivery (CCSD), and ethical compliance levels (ECLs) in the Nigeria public sector by investigating the variables and challenges associated with public service ethics (PSEs) and how citizen-centered PSEC measures would help to engender sound governance and sustainability of policy reforms in developing countries. The PSEC case of Nigeria would be a very interesting one to look at in-depth – since there is very limited knowledge not just on Nigeria, but from across the African continent, on a range of important ethical administration and governance-related issues in public administration.

In recent times, scholarly research on ethics, citizen-centered service delivery, and public trust has gained prominence among public administration researchers for decades (Houston et al. 2016; Yeboah-Assiamah et al. 2016; Kumasey et al. 2016; Beshi and Kaur 2019; Camoes and Mendes, 2019; Ukeje et al. 2020b). However, prior to this upsurge of interest, little attention was paid to administrative ethics. Previous studies attributed the issues of bureaucratic inefficiency, red-tapeism, weak accountability, policy failures, low professional standards, corruption, low productivity, and lack of control in Nigeria public service to lack of good democratic practices, weak bureaucratic governance, and unclear definition and legitimization of the powers of the implementing agency (Ikeanyibe 2015; Okpata and Ukeje 2017; Ukeje et al. 2019). Thus, in the words of Henry (2002, as cited in Ezeani 2006, p. 373):

> Prior to the abandonment of politics/administration dichotomy and the principles of administration, the public administrator, needed morality no more than a hotel clerk carrying out his or her daily duties. After all, of what use was morality to a person who did no more than execute the will of the state according to certain scientific principles? Provided that public administrators accomplished their given tasks effectively and economically, they were by definition, moral in the sense that they were responsible.

Scholarly literature in Nigeria public sector governance and accountability has paid very little academic attention on the nature of public sector governance within the framework of ethics and citizen engagements that addresses issues related to the development of public sector policy reforms in sub-Saharan African country such as Nigeria. The few studies that have examined the ethical condition of Nigerian public sectors have relied exclusively on historical, descriptive, and documentary analytical reports of published corrupt practices and the level of embezzlements in various sectors of the economy under different regimes (e.g., Gundu 2011; Ezeani 2006; Ighodalo 2018; Ojo 2019). Specifically, Ojo (2019) argued that the Nigeria's public service system and its corruption idiosyncrasies cut across all sectors in both the private and public arena. In his words:

> The Nigerian corruption is so complex to the extent that no one can actually provide conventional understanding on how corruption is legalized in the public domain.....the citizens often pay extra money for the basic social services that have been provided for free by the government. Other services that public officials receive illegal payment include issuance of license, university admission, employment, contract, passport, and birth certificate. The money is usually paid by the citizens in the form of bribe and gratuity so that they can bypass the procedural rules governing the scheme of things as well as getting the preferential treatment. (Ojo 2019a, p. 6)

This presents a fundamental social/administrative challenges emanating from social contexts within which business of public administration is being carried on. It further raises the question as to the role of public sector imposed restraints and rigors in moderating idiosyncrasies of public officers. There is no prior study on the ecological and/or environmental aspects of PSEC measures applied to the Nigerian context in general and Ebonyi state public service (EBSPS) system in particular.

This shortfall represents a significant gap in the literature, since results from previous studies suggest that Nigeria's public sector governance is bedeviled with lots of ethical issues (Osawe 2015; Ijewereme 2015, 2018) resulting to poor citizen-centered service delivery and constant policy failures. This is so much so at a time Nigeria is attempting to engender service rebirth through anti-corruption measures in the public service. However, according to Ojo (2019a, p. 16), the anti-corruption agencies assigned with the responsibility of combating corruption have been moribund with the dearth of prosecutorial proficiency which remains a big obstruction of legalism. Not only that, there is also the other issues of political control of these agencies which has passed them off as mere "political tools against opposition forces." Such practices grossly undermine the integrity of public bureaucracies of Africa in general and Nigeria in particular because of the overwhelming criticisms over the years on the nature of their public sector governance (Yeboah-Assiamah et al. 2016) and its impact on the citizens (Idike et al. 2020) in spite of various administrative reforms (Ukeje et al. 2019) due to its accountability questions (Ukeje et al. 2020b).

Thus, institutionalizing public service ethical compliance (PSEC) measures will help to solve the service failures of previous policy reforms and to enshrine the adoption of stronger regulation (Ukeje et al. 2019) and mechanisms since the Nigerian service-compact policy geared toward citizen-centric service delivery has failed to transform the processes of public service delivery (Offu et al. 2018) in the course of achieving a kind of state-citizen interactions that has implication not only for scaling-up the governance ratings of the government but also for the overall reforms that improve the conditions under which the street-level bureaucrats do their jobs in social services provisioning (Ukeje et al. 2021).

This chapter is obviously important in public administration to reveal insights not only in specific laws geared toward administrative reforms but also to the impact laws have on good governance as opposed to internal ethos of government workers. Based on established public service ethical concepts and relationships, a conceptual framework linking PSEC measures, citizen-centered service delivery, and public trust in Ebonyi state public service is introduced. Thus, the establishment of a citizen-centered Ethical Compliance Service Charter (ECSC) that will be focused on strengthening social accountability

mechanisms and individual-level moral/ethical character of public servants in driving the sustainability of PSEC measures in the Nigerian bureaucracies becomes imperative. The Ebonyi state public service (EBSPS) system with its distinctive nature presents an excellent opportunity for research to further highlight the actual factors underlying unethical practices, bureaucratic corruption, and policy failures as it affects PSEC measures, despite the institutional mechanisms instituted to correct the ills in the system.

## Understanding the Nature of Public Sector Governance in Ebonyi State

Obviously, many countries are faced with varied challenges in their public sector that requires urgent solutions that are transformational in nature (Oyeyinka 2006); perhaps this explains why new public management (NPM) swept across most developed countries of the world such as New Zealand, Australia, Great Britain, and the United States. NPM's capacity for achieving the triple aim of public administration (i.e., efficient, equitable, and resilient service delivery) and its ability to address the *wicked problems* of society (Marshall and Abresch 2016) is yet to be determined in developing countries like Nigeria. For example, recent studies on the state of public service delivery in Nigeria (Ndukwe et al. 2015; Ndukwe et al. 2016; Okechukwu et al. 2016; Ukeje et al. 2019) assert that Nigeria public service is bedeviled by lack of proactive reforms to drive the vision of the NPM in an ethical and transparent manner. This has contributed to bureaucratic policy failures since the internal ethos (behaviors) of the civil servants frustrates and negates the ideas and ideals of service delivery and brings to question the effectiveness and usability of New Public Service paradigm. The constraining internal ethos is a dimension of the so-called wicked problems of public policy (Simon 2017; Carey et al. 2017). These *isomorphic pressures* often hamper behavioral modifications to respond to demands of public sector bureaucracy despite several reforms. Thus, a recent study on public sector reforms in Ghana has found "the fruitlessness of anti-corruption agencies" since political appointments have been observed to contribute significantly to corruption risks in public administration and political appointees to various administrative positions in most cases have the potential to collude with politicians in their corrupt practices instead of having the audacity to expose such nefarious and corrupt practices perpetuated by such officials (Asamoah and Ofosu-Mensah 2018, pg. 7). For example, in Nigeria, there is this phenomenon called "table manner," an informal rule governing principal agent action in the public place that breeds factors such as age falsification, attendance/time book manipulation, bribe taking, and kickbacks, among others, that influence prevailing code of ethics/rules of engagement in Nigeria public service. The idea is that "one who is eating, has his mouth stuffed with foods does not talk." That is, those who benefit from proceeds of corruption do not tell on their benefactors. This further puts a question mark on the whistleblowing policy of the Nigerian government. The argument is that unless something beyond structural changes in the formal sector is done, from *compliance-based* approach to something of new institutionalist *capacity-building* approach, a collective *problem-solving approach* that incorporates exchanges between informal and formal norms and values, public service reforms will continue to be countered by value inconsistencies.

This by implication opposes to Friedrich and Finer debates in enhancing a citizen-centric service delivery and the overall performance of public service (Friedrich 1940). The New Public Service standpoint, deep-seated in democratic government theory, highlights the accountability of officials to citizens, whereby officials serve and respond to citizens rather than steering society. It assumes that representative officials will be inspired in servicing public interest in a committed and dedicated manner, thereby responding to citizens' expectations of a healthy and responsive public service (Osborne 2006; Denhardt and Denhardt 2011). Importantly, while the Old Public Administration (OPA) witnessed limited discretion, the NPM enjoyed greater discipline. All through the era of NPM, emphasis was on

decentralization and horizontal specialization in public agencies. The second paradigmatic transition saw the emergence of the New Public Governance (NPG), simply referred to as the post-NPM. It shares enormous characteristics with the NPM. The closed system associated with the OPA had phased out, ushering in initiatives such as coproduction, partnership, and collaboration. It is characterized by the concepts of coordination, centralization, governance, networks, and partnership (Christensen 2012).

In the era of NPG, emphasis is on transferring some responsibility of public service delivering, in collaboration with the bureaucracy, to the citizens who are now considered as active partners (Levine and Fisher 1984; Puolokainen and Jaansoo 2018; Farazmand et al. 2019), a bilateral partnership necessitated by globalization (Farazmand 2017). This is an initiative that calls for strong regulations to boost ECLs. Experience with both bureaucracy and bureaucrats represents one of negative reflection, a major reason for shifting service delivery to citizen partnership. Bureaucracy is better evaluated at service-user level where citizen-bureaucrat interface is relatively embodied. Sound governance, as critically conceptualized by Farazmand, has as its constituent elements comprehensiveness, autochthonous governance regimes, competence, societal cultural base, inclusivity, and internationally acceptable values (Farazmand 2012, 2017).

Importantly, sound governance is proposed in response to the fundamental flaws of "good governance," a concept Farazmand borrowed from the ancient Persian Emperor Darius the Great (521–480 BC) who's comprehensive administrative reforms were considered essential for a "sound economy and administration" of the world's first and largest empire – the One World State of the Achaemenid Persian Empire (Farazmand 2004, 2009, 2012). Sound governance is consistent with the New Public Governance (NPG) approach in public service delivery and performance. How does this core tenet relate to the broad issues of public sector's ethical governance in Nigeria? How does the paradigm correlate with the multicultural nature of Nigerian public service and the recurrent calls for a pragmatic and result-oriented reform in the system?

## Research Design

This study adopted a mixed method research design (Johnson et al. 2007), due to the nature of the subject of study. Specifically, we adopted concurrent mixed method design which seeks to "converge quantitative and qualitative data to provide a comprehensive analysis" (Creswell 2003). This method has been found to be a useful tool in determining complex phenomenon that may defy a single method design (Creswell 2013). The semi-structured interviews were guided by the phenomenology research which helped to identify participant's experiences of the phenomenon (public trust, transparency, accountability, service delivery, integrity, responsiveness, conflict of interest, bureaucratic corruption, personal networking, and ethical compliance measures) being discussed. The survey was undertaken in English language since it is the lingua franca for Nigeria. Experiences of ethical quality were determined during the survey, which covered the dimensions identified in Fig. 1. We designed a survey instrument which contained 33 items on 3 research hypotheses (13 on relationship between PSEC measures and public trust (PT), transparency, and responsiveness; 6 on link between IC, cultures, values, orientation, ethnicity, and the nature of PSEC measures; and 14 on effect of PSEC measures on service delivery and accountability). Every dimension has adequate number of questions covering relevant aspects of existing ethical compliance measures. The questions were designed in a five-point Likert scale (5, strongly agree; 4, agree; 3, neutral; 2, disagree; 1, strongly disagree). The survey was carried out in EBSPS in Nigeria, and a total of 200 were distributed directly to the respondents in 2017 through the help of three research assistants; out of which, 186, representing 93% response rate, were returned. Furthermore, using purposive sampling technique to select relevant strata (local public stakeholders) of the population that have experience on public decision-making processes

**Public Sector Governance and Ethical Compliance Indices, Fig. 1** Conceptual framework model

in Nigeria, one of the research assistants conducted a semi-structured interviews from November to December 2019 based on certain themes in the hypothesis. The responses were recorded using electronic device and later were transcribed to paper. To protect the identities of respondents, researchers have decided not to include names and official addresses of respondents in the final drafts of the report.

## Linking PSEC Measures, Citizen-Centered Service Delivery (CCSD), and Public Trust (PT) in EBSPS

According to Ezeani (2006), because public organizations are established by Acts of Parliament or orders of the executive arm of government, supported by taxpayer's money and expected to meet the needs and aspirations of the citizens, their managers are made accountable to public. Thus, the ordinary citizens have the right to probe into the activities of public officials, in order to ensure that the public purpose is served and that public funds and resources are not mismanaged or misappropriated (Ezeani 2006, p. 13). Good governance is not only about the further development of the rule of law and democracy, but it also includes the elements of accountability and efficiency of the government (Addink 2019, p. 3–4). The six core principles of good governance are properness, transparency, participation, effectiveness, accountability, and human rights (Addink 2019, pg. 19). Accountability is an obligation to provide an account to someone with a legitimate interest. It involves a counting of possessions and the classifying of information on the basis of norms and conventions (Ferry and Murphy 2018, p. 619).

Thus, we intend here to highlight the relationships among CCSD and PT. Although public administration plays a strategic role in the economic and social development policy arena, the Nigerian public bureaucracy and governance is weak, largely dysfunctional and in need of improvement (Offu et al. 2018) especially in this era of Sustainable Development Goals. This is because there are so many challenges relating to the implementation of the strategies and action plans required to achieve the goals (Fleming et al. 2017). Studies in EBSPS since creation in 1996 have revealed that the system witnessed a lot of turbulent experiences, arising from persistent unethical behavior and general administrative inefficiencies from flawed reforms which shun compliance with modern theories of public administration. This gave birth to the *Attitudinal Change Policy* of the immediate past government of Chief Martin Elechi. The scope of the policy was designed to permeate the entire fabrics of the

society where changes are expected on entrenched behavioral patterns. It was a matter of policy then that people, irrespective of class, could no longer attend public functions behind schedule, shun nepotism, be accountable in both public and private life, etc. and acting otherwise attracted swift consequences. It was also reinforced with aggressive pubic campaigns and rewards, a carrot and stick approach on the platform of *Ochudo Time* mantra.

It was expected that the general public buy-in of the agenda would trickle down to the public institutions and change the ways things are done in the State for the good of all. However, though the civil service handbook is quite exhaustive, dealing with all salient features of the service, the role of the civil servant in government and the manner in which government business should be conducted in order to have an efficient and effective administrative system capable of winning public confidence, it had failed to limit the behavior of bureaucrats in the state within acceptable norms in public institutions. So concerned was the government that it invited Dr. Myles Munroe for capacity building of public servants in the administrative cadre. But soon after that exercise, the service situation and ethical climate quickly relapsed to the status quo ante as if nothing was taking away from the program, thus supporting the position of Thaler and Helmig (2015) that ethical leadership does not necessarily "align formal written codes and informal prevailing values. . .(pg19).

Therefore, institutionalizing ethics in governance and PSD practices and/or policy reform initiatives through a proactive and result-oriented ethical strategy has centered on enhancing a platform for effective and efficient institutional role-taking, in order to achieve equity, transparency, participation, responsiveness, accountability, and the rule of law in a global perspective. This should, all other things being equal, lead to PT, sound ethical administrative governance, institutional capacity (IC), and the eradication of unethical behaviors since ineffective institutions usually result in the greatest harm to the poor citizens and vulnerable in the society/the users of public services.

It is pertinent to note that the strengthening of PSEC measures and sound administrative governance determines the way in which the effectiveness of public policies and strategies is attained, especially in public service delivery (PSD). This has great implications for sustainable development in EBSPS. Thus, improving the democratic quality of political engagement and enhancing participation of the poor and marginalized citizens in PSD are a function of sound administrative governance built on the platform of public service ethics and accountability. The idea is to drive the sustainability of PSEC measures for the transformation of PSEC reform in emerging bureaucracies grappling with challenges of institutional capture (Ukeje et al. 2020a, b; Ndukwe et al. 2020).

## Conceptual Framework Model

According to Carey et al. (2017), there has been search for new institutionalism which seeks to establish a new reality about how organizations and their environment are perceived and responded to. Indeed, the observed reality that in responding to these pressures, "organizations are forced to a homogeneous state" implies attempts by extra-organizational variables to blur the lines between public formal organizations and the "informal" institutional norms and values that surround them. We have referred to the *table manner* phenomenon, an institutionalized quid pro quo relationship in the bureaucratic system. Public service environment constitutes the entire spaces within which the business of bureaucracy is carried on. It ranges from the physical/structural to the ideological/normative dimensions. While the former should include all the material aspects of bureaucratic activity, the latter encompasses nonmaterial/values aspect of bureaucracy. Both aspects of course have received considerable attention from researchers and practitioners in a bid to democratizing the former and strengthening the latter.

The fundamental question is how to reinforce formal organizations to respond to contemporary informal demands without necessarily making it

disoriented and powerless or insensitive and rigid and, in the process, jeopardize the opportunities and efforts toward a wider response to organizational challenges in the postmodern era of public administration. It is important at this point to note the need for widening of scope of public sector reforms beyond the formal organizations to incorporate the citizens element in exploring options for improving sensitiveness to *public value* which is not merely what is produced as services (outputs) by government but also how what is produced is received by citizens (outcomes); what has meaning for people rather than what a public sector decision-maker might presume is best for them (Alford and O'Flynn 2009, p. 176), and recognizing "a mixed approach that benefits from the advantages of professionalism as codes to guide public servants and an active conscience to help them" (Al-Habil 2011). As Carey et al. (2017) asserted, "informal institutional practices can circumvent problems with formal structures – making them highly productive for achieving policy goals (pg.6); because the human conscience could be a useful tool for behavioral control when constrained by piercing public scrutiny as Omotoye (2018) argued, corruption does not thrive where information on processes, procedures, and issues of national interest are freely open to the public. The *table manner* phenomenon, for example, is not seen as corruption but as informal mechanism of reallocation of equity among competing interests by Nigerian public servants and so is hardly reported. This lays credence to the argument that "...kinship and patronage relationship promotes clientelism in the socio-political arena. The clients are provided with basic welfare access or needs while the patrons enjoy the political legitimacy and authority. The recognition of informal network by the clients serves as a source of economic and social fulfillment..." (Ojo et al. 2019b, p.2). Thus, ECSC should reposition the citizens as active agents in the entire ethics governance process (see Fig. 1).

Results from interviews with some officials of Nigeria public service and citizens support this finding that though certain elements of sound governance may exist in a public service, its modus operandi could be a serious problem and alter its expectations as is the case with Nigeria where they exist in forms of informal structures exploiting public good rather than create it. For instance, an opinion offered that state public service apparatus have been emasculated by few powerful and rich individuals and are used to target and oppress the poor and perceived enemies:

Respondent 05:

> "There is little real mechanism for redress in Nigeria public service. Look at
>
> a situation where an MD will have a private clinic, when patients come to hospital he is serving at with a case, instead of him to attend to them in the public facility, he mishandles the case so that it will deteriorate and make the patients seek alternative. Then he cleverly offers them referral to his private clinic or others in which he has interest for treatment at a very exorbitant charge. And if you see the way these patients are taken care of in the private clinic, you'd wonder whether the doctor is still the same person that attended to them in the public facility. And there is usually no consequence for negligence of duty because virtually all top MDs are in the game (Patient).
>
> The Judiciary is in the hands of few privileged. If you don't have.
>
> Somebody you cannot be vindicated, that is, one to help in resources.
>
> and other things to help you pursue the case. The poor are the victims.
>
> of misrule and injustice" (Environmental Health Officer).

Respondent 04:

> I think the fundamental problem is not the absence of ethics codes
>
> or even lack of structures. I really think the problem is lack of necessary
>
> incentives to function acceptably. Public officers act the way they do
>
> because they are free to do so. And you know the problem of esprit de corps
>
> which compels mutual protection among colleagues especially when there is
>
> mutual culpability (Senior Lawyer).

On the charter being proposed he said:

> It is very sacrosanct. Because then, the citizens will provide the

> necessary incentive I mentioned earlier that is lacking for
>
> public officers to function. I can refer you to a case, you recall the
>
> case of Wadume, that popular kidnapper? Recall that his case was
>
> almost buried away until there were public outcry all over Nigeria
>
> for him to be trialed. Government had to yield.

Furthermore, we also found evidence for trust deficiency in the course of the interview.

Respondent 15:

> The whistle-blowing policy will do very little because, for example, moneys recovered through the process are not even accounted for... if there is a system that is stern and strict that can impose change on the people because the people do not even trust in themselves so they cannot trust others. There is a need for an all-encompassing system that constrains the substructure to live in some kind of prescribed mannerism (Sociologist).

But if the "all-encompassing system" is not cooperative in nature, it might fall in the same trap as previous reforms, because the implementation prospects would still rest on those who have captured the state apparatus. This agrees with the position of Nwogwugwu (2018) as cited in Ojo (2019b, et al. p.9) that "one fundamental issue observed across Africa, is that, the big men have monopolized all the political offices, and the youths who they allow to occupy public office are their children and puppets who are being groomed to take over the legacies of the political big men, thereby entrenching a form of circulation of elites."

## Hypothesis

This study was aimed at getting better insight of the relationships between PSEC measures, public service delivery (PSD), institutional capacity (IC), and public trust (PT) in EBSPS. Thus, the following hypotheses were tested:

**H1:**

There is no correlation between the overall effects of inefficient PSEC measures, public service delivery, and accountability.

**H2:**

There is statistical relationship between PSEC in EBSPS and public trust, transparency, and responsiveness.

**H3:**

The PSEC measure is independent of institutional capacity, culture, values, orientation, and ethnicity.

While we note that the exploration of the relationships among the variables indicated in the hypotheses is not a novel endeavor itself, the relevance of this study is that it has not been previously tested in the context of this study. Hence, guided by the conceptual model depicted in Fig. 1, the nature of PSEC measures in EBSCS was examined in terms of PT, transparency, and responsiveness; PSEC resilience was tested from the points of IC, culture, values, orientation, and ethnicity, whereas the overall effects of PSEC measures were determined from the prisms of PSD and accountability (see Tables 1 and 2).

## Results Analysis and Discussion

The results support the conceptual model linking public service ethical compliance measures, citizen-centered service delivery, and public trust. In particular, this study shows how factors such as age falsification, attendance/time book manipulation, bribe taking, and kickbacks, among others, influence prevailing code of ethics/rules of engagement in Nigeria public service. This study has practical implications as it adds to the body of knowledge relating to public service ethical reforms and management. This is hoped to promote PSEC measures for enhanced public trust, accountability, transparency, responsiveness, and value reorientation in public service institutions.

Accordingly, the result in table above is the result of regression model (multinomial generalized linear model) of the level of relationships between ethical compliance and PSD (Table 1). For the categorical variables (level of ethical compliance and PSD), the last category is used as reference category. In addition to the ethical

*OR* odd ratio, *CI* confidence interval, ($p < 0.05$) indicates significance

compliance as a dependent variable, we have an interaction of the institutional capacity and service delivery as independent variables which measure the extent or magnitude of the relationship or effect of poor ECLs on the performance of civil service delivery. From Table 1, the p-values for the effect sources of the model are all greater than the established confidence level ($p < 0.05$) indicating that both inefficient ethical compliance measures and its interaction with level of service delivery are significant. Thus, H1 is accepted. The same are also true for the other dimensions interrogating relationships between sound ethical compliance measures and levels of PT and the interplay of PSEs and exogenous elements of values, cultures, and norms of society formally extraneous to traditional public service ethos, leading us to reject both H2 and H3. The implication is that while PSEs are seen as necessary desirables in organizational management in EBSCS, their operations actually remain minimal as a currency for optimizing PT through improvements in

service delivery; instead, recourse is frequently taken to forces beyond the boundaries of formal bureaucratic limitations. These observations seem to agree with that of Farazmand (2016, p.1) that:

all government organizations must perform with efficiency but,
efficiency is not their main purpose; it is only a means,
to an end. . . Achieving end goals using legitimate means is,
essential to government organizations; ignoring or bypassing,
required processes and legitimate means presents significant,
problems of potential violation of laws and accountability in,
assuring democratic administration.

The reason this is so, as already noted, is simply that the spheres of formal/informal values interaction are expanding rapidly in the postmodern era of public administration where public value has taken on increasingly new meanings. What has happened is not a fundamental redefinition of PSEs but rather the expansion of it to accommodate previous *blind spots*, previously considered either irrelevant or insignificant in the public process necessitating the *sound governance movement* seeking collaborative engagement of citizens (Farazmand 2012) in enacting desired changes in producing public value capable of improving public trust ratings (Idike et al. 2019). As it seems right now, the "public" are beginning to redefine *their process* to accommodate "more traditional citizen-oriented complaints handling appeals mechanisms, which though do contain inherent inefficiencies, are equally important in reinforcing good governance (this time, sound governance) norms and values such as citizen voice" (Brewer 2007, p.6). This agrees with the position of Jilke and Walle (2012) that citizen-complaint behavior is flexible and reflects economic and expectation push factors within subgroups, even jurisdictions; the fulfillment of this expectations is linked to PT. When citizens perceive the bureaucracy as insensitive feel that it promotes the interests of powerful individuals or group based on political considerations, public attitudes toward democracy may become more cynical (Vigoda-Gadot 2007, p.290).

## Conclusion

Globally, public sector managers and researchers are becoming increasingly aware of the significant benefits derivable from functioning ethics in public processes especially in the postmodern public administration era where the traditional boundaries of bureaucratic ethos are being strongly exerted and rapidly too. Results of this exploratory study further affirm known relationships among PSEC measures, service quality, and PT: that citizens' trust is escalating the effect of sound governance (Mishra and Momin 2020). The study highlights the necessity of paradigmatic shift to a social accountability framework that harnesses informal ethos for a wider and more resilient PSEC measures in public processes. The results also emphasize the roles ECSC could play in promoting sound ethical climate in public institutions. Thus, for the attainment of sound administrative governance and sustainable development in EBSPS, citizen-centered ethical body should be instituted at all levels of government: federal, state, and local levels of administrative offices, establishments, and parastatals to engender ethical code consciousness and reinforce compliance measures in a prevailing state of "table manner phenomenon," a typology of mimetic and normative dimensions of isomorphism, especially as availability of Code of Conduct Bureau, Public Complaint Commission, EFCC, ICPC, and other regulatory agencies has shown pathological deficiencies in confronting violations of PSEs in the state. In Ebonyi state, PSEs can be managed through implementing a sound ethical code, by synergizing with top management teams and the commitment and support of an ethics officer, trained and empowered to report unethical behavior and the auditing of ethical performance. The aim is to establish greater ethical clarity and climate and to specify acceptable and unacceptable behavior in the system. Findings reveal that lack of the presence of an ethic officer in the human

resource department of EBSPS is a major challenge in institutionalizing public service reform in the system. More so, there is lack of ethical orientation and synergy between the ethical bodies/institutions, the public servants, and the citizens for enhanced performance and service delivery. Findings further revealed that employees are constrained by harsh socioeconomic conditions and poor reward/remuneration system and high incidence of extended family dependency burden/ratio. The effects culminate into high ethical dislocation and loss of national consciousness that are potential triggers for public sector corruption. Thus, following the decline in the political, economic, and administrative condition of Nigeria, public institutions face problems of high cultural consciousness and ethnicity, which results in loss of patriotism and public confidence, and the legitimacy of public service in Nigeria and elsewhere is found in a critical condition.

This chapter therefore argues that new PSEC policy options that reduce ethnic and cultural as well as other anti-ethics attachments on public institutions and employees be instituted as a way of enhancing employees' institutional compliance. This measure remains a sine qua non in attaining quality of service delivery and sustaining sound institutional and ethical climate and integrity. This creates a reformative and transformative service culture that recognizes the citizen as active partners of government deserving accountability, integrity, and honest service and the institutionalization of a sound ethical climate in the process of discharging public services. Importantly, active citizenship participation, demands, and access to these institutions compel political will. Additionally, the idea is that focus should not be only on improving service delivery through reforms but establishing an ECSC that will be focused on strengthening the individual level of moral/ethical character of the citizens to drive the sustainability of PSEC measures in the Nigerian bureaucracies that will help to achieve the tenets of sound governance as proposed by Farazmand, especially when we consider that a public officer could "at least in theory obey all the aspects of the letter of the code but still behave unethically" (Atkinson 2016, p. 3). It will serve as a natural extension of the progress made toward realizing the vision of the NPM down to the NPG paradigm, and also it will help in addressing society's *wicked problems*. This no doubt will drive the whistle-blowing act of the Nigerian government. Importantly, legislation on, and implementation of, whistle-blowing act enhances transparency, accountability, responsiveness, and PT. Establishment of the ECSC will not only facilitate the attainment of PSEC reforms but will reduce the level of cultural and ethnic tendencies in the Nigerian public service as evidenced in the conceptual model (see Fig. 1). In this context, the ECSC forms part of the much bigger NPM agenda as a citizen-centric charter aimed at enhancing and/or improving the quality of PSD and PT by establishing strong relationship/partnership between the citizens and the outside world. This no doubt, from the standpoint of institutional theory of administrative reform, will help to modify collective values, culture, and structure to make the organization adaptive and dynamic (Farazmand 2004). In this vein, the institutionalization of ECSC in the study area supports the argument of Cinquini et al. (2017) on coproduction and governance particularly as it concerns PSD and citizen participation. It also benefits from some theoretical insights on the practicability of a place-based "systems leadership" initiatives and development that have the potential to generate public value in cross-sector partnerships for increased accountability and in addressing "wicked" challenges (Bolden et al. 2019).

Public administration practitioners will find wisdom in the findings of this work for managing their personal choices to buoy their confidence in keeping to institutional ethics especially in a recessed economy and in the future. This paper has implications in the overall management of future HRM practitioners both in developed and developing countries. This paper, however, agrees with Yeboah-Assiamah et al. (2016), who explains that what occurs in the social or

traditional setting easily transcends into the offices of African public sector, since not many employees who observed ethical violations actually report them (Taylor 2018). Thus, instituting the virtues of citizen-centered ECSC will help to develop a citizen-centric ethical governance that will restore trust, transparency, accountability, and a value-based virtue in our public and private lives. These are recipe for sound administrative governance and the attainment of sustainable development in Nigeria's public sector organizations. This no doubt will help to restore the legitimacy of public service in Nigeria and other developing countries in general, build strategic capacity, and thereby develop more sustainable practices in the pattern, manner, and development of PSEC measures and adoption in EBSPS system. This is because citizen expectation/confidence is bound to diminish toward public officials if cases of unethical behaviors persist in government institutions. This by implication will help to realize the targets set in the goal 16 of the SDGs especially in Nigeria and other developing countries.

Our findings on the nature and practice of PSEs in EBSPS did not support the earlier findings of Kumasey et al. (2016) that codes of ethics developed by organizations will significantly and positively predict and shape employee commitment without some incentives. This is as a result of the prevailing nature of state capture accentuated by the table manner phenomenon. The results support the conceptual model linking public service ethical compliance measures, citizen-centered service delivery, and public trust. In particular, this study shows how factors such as age falsification, attendance/time book manipulation, bribe taking, and kickbacks, among others, influence prevailing code of ethics/rules of engagement in Nigeria public service. This chapter has practical implications as it adds to the body of knowledge relating to public service ethical reforms and management. This is hoped to promote PSEC measures for enhanced public trust, accountability, transparency, responsiveness, and value reorientation in public service institutions. Generally, the policy implication is that this paper fuels ongoing concerns about the impact of public service ethos, citizens' trust, policy reforms, and social accountability.

# Public Sector Innovation in Korea

Dong Chul Shim[1] and Hyun Hee Park[2]
[1]Department of Public Administration, Korea University, Seoul, South Korea
[2]Department of Public Administration, Kookmin University, Seoul, South Korea

## Synonyms

Administrative reform; Governance innovation; Employees' innovative behaviors; Organizational change; Public sector reform; Public service innovation; Technological innovation

## Definitions

Public sector innovation can be defined as new approaches that public sector organizations such as government organizations and public corporations adopt and implement to improve the quality of public services.

## Introduction

The Korean governments have performed reforms over the last half-century and, accordingly, there has been a substantial body of literature that has examined the government's such efforts and various issues related to the results of the reform. However, no study has not attempted to review these studies conducted in the Korean context systematically, and it is surprising considering the significance of the literature done in this field. Thus, the purpose of this entry is to review previous studies and provide implications for future studies. In particular, the current entry aims to identify the main themes of existing studies on innovation in the Korean public sector and summarize the primary findings of those studies.

## Methods

### Data

For the analysis, 188 articles published between January 2002 and June 2018 (The current study used 2002 as a starting point considering the emergence of innovation studies in Korea. While a few studies about innovation was found before 2002, the number was sporadic. Because the term of innovation started to be used actively after 2003, year of 2002 was used to compare the increase of innovation studies) were selected and reviewed. The very first two empirical studies on this subject were published in 2002, and the number of innovation studies increased dramatically since 2002, which mainly resulted from the former President Roh's (2003–2008) great interest in the innovation and reform in the government. In 2008, 27 articles were published in 1 year. After his term ended, the number of articles on this subject decreased immediately. However, the word, *innovation*, has been widely used in various policies since then, and it often grants new administrations legitimacy. For that reason, we so extended our search until June 2018. We initially reviewed several articles and extracted the most common keywords related to innovation in the public sector, such as *public sector reform, government reform, public sector innovation,* and *government innovation.* Those keywords were used for iterative searches at the DBpia, the largest and the most comprehensive academic research database in Korea. The ten public administration journals listed in Table 1 were selected.

For the data analysis, we conducted a series of analyses as follows. First, using the keywords the author(s) of each article registered for the database, the word frequency of those keywords article was calculated, and the word cloud was generated based on the frequency; this analysis could give the reader the holistic view of primary themes of the studies on innovation in the public sector in Korea. Second, a text network analysis was conducted to capture how these main topics were related to one another (For further information about text network analysis and text analysis,

## Innovation in Korean Public Sector

### Innovation in the Public Sector

*Innovation* is probably one of the most underdefined yet overused concepts in the Korean government. Innovation can be defined differently depending on the given context, so it is not uncommon to find it difficult to define innovation in a universal way (Damanpour and Schneider 2006). That is, the term *innovation* has never been clearly defined from neither practitioners' nor researchers' perspectives, but it has been widely used to refer to virtually all new public services, policies, and organizational practices ever since (e.g., innovative programs, innovative growth, innovative cities).

The former President Daejung Kim (tenure: 1998–2003) is also well-known as the president who brought several innovative policies including his economic policy that facilitated knowledge- and IT-based venture industries. However, it is President Roh who received the most scholarly attention, not only appreciation but also criticism, and this originated from his strong will to pursue "the small government" and to improve the efficiency of the government. Roh administration restructured the government organizations and adopted new practices that may improve the efficiency of the government (e.g., performance management). After Roh administration ended, the former Presidents Lee (tenure: 2008–2013) and Park (tenure: 2013–2017) also pursued their innovative policies such as "Green Growth" and "Creative Economy," but they did not focus much on administrative innovation, except that Lee administration made tremendous efforts to make the government agency similar to a business-like organization. The on-going changes from the Roh administration to the Park administration imply that there were significant paradigm shifts on the government role and its organizations whenever there was a regime change.

According to Hwang (2013), the Rho administration eventually aimed to increase democracy and, accordingly, it emphasized citizen participation in the policy-making process and also pursued the on-going cultural change of the government to embrace citizens' voices into its decision-making system. On the other hand, the Lee administration idealized the business-like organization so that it valued the managerial efficiency in the government and cost-effectiveness of public services.

In summary, innovation is a very broad concept, while it involves something "new" whether it refers to organizational practices, policies, or services. As we will discuss further below, innovation in the public sector, in particular in Korea, is largely constrained by the political regime and its fundamental philosophy on the relationship between the government and the citizen.

### Theoretical Background

The underlying theoretical background of the previous literature in this area is New Public Management (NPM). Based on NPM, most studies

praised that government organizations should also improve their efficiency and service quality to provide citizens (as customers) with better public services (e.g., Kang 2002; So and Hong 2004). Performance management became a fashion as a result of the new paradigm and has been considered a solution to improve the efficiency and the effectiveness of the public sector.

However, at the same time, many scholars also criticized NPM and raised fundamental questions about whether NPM is appropriate as the philosophical foundation of the government's practices. For instance, Kwon and Kong (2015) questioned that it might not be the best approach to view the work of the government from neoliberalism and positivism as well as NPM, since such perspectives may dismantle the government's fundamental identity – value-laden publicness. Kim (2009) also suggests that the public sector innovation may often be superficial and decoupled from its original intention since the government is mainly interested in gaining political legitimacy rather than making an actual change in the organization. That is, innovation may be path-dependent (De Vries et al. 2016) so that an organization is more likely to benchmark the seemingly successful practices of other organizations. Thus, the government agency may believe that adopting a new method grants it political legitimacy, whether it believes that the new practice will make a difference or not.

## Dominant Themes of Previous Studies

To find dominant themes of Korean public sector innovation, the current study adopted a word cloud and text network map. First, we selected 5–6 keywords which were most referenced (i.e., high score of tf-idf) from word cloud, and then we used text network to interpret the context of how the words were used.

Figure 1 illustrates a word cloud that contains the most frequently used registered keywords of the 188 studies selected for this analysis. The bigger the words are, the more frequently they were used as keywords. Since we searched the database for the keywords listed in Table 1, the most commonly used keywords include *government, innovation, reform, administration, administrative*, and the combinations of those words. This may also suggest that the previous studies on public sector innovation primarily focused on the organizational and managerial issues, which indicates that *innovation* in that context means efficiency. At the same time, however, the keywords also include *management, governance, organizational, personnel, budget, eGovernment, policy, system, evaluation, citizen participation, decentralization, democracy, bureaucracy*, and so on. This implies that the Korean government also has considered various directions for innovation from technological innovation (e.g., e-Government) to decentralized and democratic forms of government structure.

The text network map (see Fig. 2) further illustrates that three primary domains have been studied in the field of innovation in the Korean public sector. The first domain is a *radical experiment.* The radical experiment describes a government attempt to pursue unprecedented and radical innovation, it is linked to various spectrums such as paradigm, citizen participation, decentralization, budgetary reform, personnel system, and democracy. During the Roh administration, there had been extensive discussion on the government's role and its relationship with citizens and society as well as radical changes of governmental systems such as personnel and budgetary system. At the time, there was also a theoretical discussion about whether New Public Management (NPM) can fit the Korean context. However, scholars also discussed the limitations of NPM and philosophical alternatives to NPM which make better sense in Korean cultural and historical contexts.

Second, studies on *administrative innovation* involve topics such as bureaucracy, innovative work behavior, performance management, and publicness. Usually, studies of administrative innovation focused on managerial changes or efforts of street-level bureaucrats to make differences in delivering public services. These studies were also conducted throughout all periods since 2002, and most of these studies primarily focused on the issues of bureaucratic characteristics of the government organization and benefits

**Public Sector Innovation in Korea, Fig. 1** The word cloud of keywords of the studies on innovation

of implementing performance management to increase the efficiency of the public organization and, accordingly, its accountability. However, some studies also warned that performance management hampers the publicness of the government or civic organizations. Also, a few studies suggest that the original intention of the administrative innovation can only be achieved when the reform is supported by other organizational practices and culture to foster public employees' creativity and their innovative work behavior, rather than simply strengthening the control over the employees' performance and organizational behavior. Compared to the first domain, this domain is relatively well-defined.

Third, a line of studies examined *government reform* related to topics such as citizen participation, citizen satisfaction, e-government, and governance. Usually, those studies focused on reform efforts of political appointees and tend to focus on a change of governance structure including citizen participation with a help of information communication technology (ICT). This refers to studies on e-government and governance which may involve technological innovation. An interesting observation from these studies is that these new practices did not remain within the technical aspect. Instead, it challenged the fundamental ideas of democracy and aimed to bring more citizens to the political arena. Thus, as a result, they emphasized the increased level of citizen participation and satisfaction.

## Primary Findings of the Studies on Innovation in the Korean Public Sector

Table 2 summarizes the significant findings of previous studies by the unit of analysis (i.e., micro-, meso-, and macro-level) and by category of studies (i.e., adoption/implementation and performance and outcomes). A substantial

**Public Sector Innovation in Korea, Fig. 2** The text network of keywords of the studies on innovation

proportion of the previous studies has been conducted at the micro-level (i.e., individual-level) (26%) and the meso-level (i.e., organizational level) (28%). Twenty-one percent of studies were conducted at the macro-level (14% of studies were performed at the national level, while 7% were at the regional level) (25% of the studies were not categorized in terms of levels because

they were normative studies or did not specify their levels of analysis with the clarity). These studies also focused on different aspects of innovation. That is, a line of studies focused on the adoption and implementation process, while another range of studies examined the performance and outcomes of innovation. Below, we discuss each line of studies further in detail.

### Micro-level Studies

A large proportion of the previous studies on innovation examined the success factors of organizational innovation at the individual level (26%). For instance, 16% of studies investigated public employees' readiness for innovation as one of the critical factors for successful implementation of innovation. These studies consistently suggest that it is essential for an organization to reach an agreement with its employees concerning the direction and the scope of innovation. These studies identify employees' attitudes and perceptions as determinants of successful implementation of organizational innovation.

While there are a variety of studies that examined factors affecting on adoption and implementation of innovation, the scope of the previous studies concerning the outcomes of innovation focused on the change in individual organizational members' attitude toward innovation (26% of studies), other than that, little studies have investigated the performance and outcomes of innovation at the individual level.

In that regard, the previous studies also identified managerial attitudes or administrative leadership as the critical factor to induce such readiness (e.g., Lee 2006). That is, it is the leader of the organization who can explain the purpose of new practices to the public employees so that they can be motivated to adopt the practices. Organizational members often resist organizational change, especially when their interest is at stake. Leadership also plays a vital role in managing such resistance of organizational members. Similarly, Jeong and Cho (2016) found that leadership of the central government could induce the employees of the local government to participate in the Gov3.0 initiative, which suggests that the leadership has certainly an apparent influence on the successful implementation of innovation.

### Meso-level Studies

A characteristic of meso-level studies is that these studies texted a wide range of variables at the organizational level. The variables include the adoption of innovation, innovation diffusion, performance management, the feasibility of innovation, efficiency, and so on. Concerning success factors during the adoption and implementation process, the most common topic of the studies on innovation is performance management. There are also a couple of studies that examined the adoption of innovation at the organizational level (3%). However, there was virtually no study that investigated the adoption process of innovation itself. This is probably because of the difficulties to follow through the process of innovation at an organization and to obtain an organization's agreement to participate in a longitudinal study.

Regarding the performance and outcome of innovation, the most popular topic includes the efficiency and the effectiveness of innovation (51%), since NPM is the primary theoretical foundation of these studies. These studies appear to assume that the high level of employees' innovative behaviors may result in effective implementation of new organizational practices. At the same time, such innovative behaviors could ultimately satisfy citizens (as customers). Based on the notion, also 8% of studies examined that innovation improved transparency of the government by communicating with citizens and leading them to participate in the policy-making process.

Thirteen percent of the literature identified organizational slack as a success factor for innovation, but the empirical results may be controversial. Some studies found no evidence on the causal relationship between organizational slack and success of innovation (e.g., Hyun and Youn 2005; Wang and Kim 2009), while some studies found a clear association between the financial resources and the adoption of innovation (e.g., Ryu 2005). The results may be originated from the context of the particular studies; the central government's financial support for the local government is more likely to send the local

government a signal of the political leader's strong will for the pursuit of innovation, and in that context, financial slack may be a crucial factor of the success of innovation.

### Macro-level Studies

In this entry, macro-level studies refer to the studies conducted at the national, regional level, since these studies primarily attempted to address the fundamental drives or constraints of innovation given within the political environment. Since government agencies – whether central or local – are primarily embedded within a political system, which may put a tremendous amount of pressure on the government's decision-making including the restructuring of its hierarchy or even its existence. A good example is the massive restructuring performed immediately after the unprecedented national economic crisis in 1997. Choe (2008) explains that the international monetary fund (IMF) criticized the inefficiency of the Korean government and, because of the unique situation, President Kim Daejung did not have many choices but to reform the government and gained legitimacy. Also, public employees could not resist changes.

For a reason, it is not surprising that 36% of the previous studies identified political, economic, legal, and historical context as constraints of the innovation regarding innovation in terms of methods or the scope. For example, Eom (2016) found that innovation in the public sector often did not achieve the intended purpose but, instead, the innovation was used politically to manage social pressure by showing that the government was trying to change the bureaucratic system and meeting the citizens' new needs. Another line of studies also recognized that the political stance of the regime determines the direction of innovation. As Hwang (2013) found in her research, clearly the will of the President at the time provides the public organizations with the guideline and the direction of innovation. This is particularly true in the Korean political system, a still highly centralized and top-down like system. Interestingly, studies done in Western countries pointed out environmental uncertainties as an essential factor for innovation (e.g., Damanpour 1991), only a few studies found the results consistent with Western studies (e.g., Wang and Kim 2009), which may strongly confirm the dominant influence of political regime as the motivation of innovation.

For the performance and outcomes at the environmental level, 6% of the studies examined factors to facilitate citizen participation as the result of innovation, and 4% of the studies investigated whether innovative practices improved the government's relationship with citizens or clients.

## Conclusion

This entry summarizes the previous studies on innovation in the public sector and provides a holistic picture of them. Throughout the review, we could categorize the previous literature into three themes: *experimental innovation* including various new practices to improve the government's efficiency and effectiveness; *administrative reform* highlighting the improvement of organizational efficiency; and *government reform* primarily focusing on citizen participation and democracy. We also organized the previous literature based on the level of analysis – micro-, meso-, and macro-level – and their focus on the process of innovation – adoption/implementation and performance/outcomes. According to these studies, here we present suggestions for future studies.

First, future studies should explore the fundamental changes brought by the innovation in the Korean public sector. Although the number of studies is divided almost evenly for adoption/implementation and performance/ outcomes, these studies primarily put their emphasis on the success factors or conditions rather than the results of innovation. Over the decades, the previous studies posited that NPM and the adoption of new practices might resolve the chronic problems of bureaucracy, but now many scholars believe that the premise is not always true. Thus, future studies should investigate further what we learned and what we should improve in the future.

Second, aligned with the first suggestion, the current President Moon and his administration underscore the importance of public value and

recovery of publicness of the government and, accordingly, the current regime sheds light on social innovation that enables the government to restore its exclusive function as intended. Such change also suggests the importance of political leadership. Across the level, leadership appears to be the critical factor for the successful adoption and implementation of innovation. In a hierarchical system, the role of leadership is even more influential than a more flexible system observed in the private sector. Thus, in the future, scholars should pay attention to the examination of the new direction of the Korean public sector reform.

Third, comparative studies should be examined further across nations. The Korean government's experience could be introduced to other countries. Lessons from the Korean government compared to those of other countries may provide valuable implications for other countries and Korea as well.

## Public Sector Leadership: Definition

Since the publication of Weber's *Wirtschaft und Gesellschaft* (1922), the issue of how an individual might influence the behavior of others has been a major topic of research in the administrative and political sciences. However, the topic has experienced a discontinuous level of attention. Excepting a few eminent works – in particular, Selznick's (1957) classic *Leadership in Administration* – the "*publicness*" of leadership has usually been referred to as political leadership, which is mainly performed by elected representatives in democratic regimes or authoritarian rulers in dictatorships. The consolidated belief that

administrative leadership (i.e., public sector leadership) is not relevant was related to the assumption that public executives were overwhelmed and tied by external "forces" (i.e., political power and regulatory procedures) shaping public administration and its operation, leaving no discretional power or opportunity to change the status quo. Therefore, this lack of interest in public sector executives' leadership styles was consistent with a traditional paradigm of public administration according to which elected representatives should decide and bureaucrats should execute: Any discretional power of public officials was framed more as a pathology than as an undeniable feature of public managers' jobs.

According to Van Wart (2003), interest in leadership within an administration only resurged in the 1980s, in parallel to the transactional/transformational leadership debate. It reached its apex in the 1990s when public management studies had become a specific and autonomous field of research detached from the traditional public administration paradigm and business management studies. This new focus on leadership behaviors within administrations was also related to the widespread proliferation of public management reforms in Europe and the USA and to a general shift from managerialism to "leaderism." Senior public officials started accruing greater responsibility and autonomy, increasing their decision-making power and potential to exercise their leadership in different ways and different settings. Only in this renewed context did public management theories welcome public sector leadership as a phenomenon worthy of study, and on these grounds, we define and investigate public sector leadership as the set of distinctive skills and behaviors public executives/senior officials adopt to change and reform public administration by achieving superior results and performances (Turrini and Valotti 2016).

## Public Sector Leadership: Distinctive Skills and Behaviors

Despite the claim of New Public Management scholars that public administration should be similar to that of private companies, empirical studies continue to highlight the differences between the public and the private sector when analyzing concrete practices and the behavior of administrative leaders. The main differences are tied to several features of the public administration environment, such as the diverse goals public sector organizations must pursue, the complexity and ambiguity that public sector executives face when they solve "wicked" problems hand-in-hand with politicians, and the greater transparency, accountability, and level of formalization that executives must maintain when working within the public sector (Van Slyke and Alexander 2006).

These distinctive features of public sector organizations eventually impact the skills and behaviors public sector executives use to lead their employees (Perry et al. 2010). As a summary of the different portraits of public sector leaders that emerge from the literature, we could say that public sectors leaders must combine traditional intersectoral leadership skills with a set of skills specifically related to the publicness of their organizations. On one side, the main business-like leadership skills are consistent with the transformational leadership model; administrative leaders must build and communicate a clear vision to their teams, engage in planning and monitoring results and act as change agents supporting innovation. Above all, public managers foster motivation and ward off conflicts within teams by forming unique and personal relationships with each member of their staff, giving attention to staff needs and engendering a spirit of collaboration within the organization. In addition, their communication skills and ability to negotiate are excellent. These skills have been found to be positively and significantly related to employees' job performance.

As previously stated, public sector leaders favor skills related to so-called transformative leadership over transactional ones (Trottier et al. 2008). In fact, administrative leaders have been labeled and portrayed as visionary, charismatic, inspirational, and authentic. Ethical leadership, a set of behaviors inspired by the values of integrity, neutrality, loyalty, and pursuit of the public interest, is the most peculiar type of leadership performed by public executives. For example, Downe et al. (2016) propose a series

of case studies on nine local administrative districts in the United Kingdom. In each case, they underline the importance of demonstrating personal moral values rather than behaving according to formalized ethics codes, particularly when public officials must intervene to solve tangled public problems. Consistent with this portrait, Hassan (2015) distinguishes three fundamental attributes of effective leadership in the public domain: the ability to be a model for subordinates, the ability to treat people with equity, and the ability to actively manage ethical issues and clearly communicate high ethical standards.

Another important aspect of public sector leadership is "responsibility sharing." Miao et al. (2013) highlight the importance of the public leader promoting employee empowerment, showing support to their staff, and encouraging them to take personal initiative and share the leader's responsibility. This participatory leadership style impacts the affective and normative commitment of employees to the organization and enhances the emotional trust ("affective trust") employees feel towards their leader.

## Public Sector Leadership as Distributed Leadership

More recently, the debate concerning public sector leadership has focused on distributed leadership. In contrast to the image of a heroic and solitary leader, distributed leadership refers to a set of skills and behaviors collaboratively performed by more than one member of a group according to the needs of the context. Distributed leadership is the main emerging paradigm in fields like emergency and disaster response, public private partnership, and interorganizational management (Orazi et al. 2013). This leadership paradigm is emerging in public administration and governance studies and under different labels: public leadership, integrative leadership, collaborative leadership, and public network leadership (Turrini et al. 2010). In all these cases, leadership is framed as a driver and a condition of collaborative practice or as a collaborative practice itself.

The distributive leadership approach is consistent with a new public governance paradigm that calls for the development of new methods of portraying public administration efforts (Osborne 2006). The plurality of actors involved in the production of public value, the increasing fragmentation of administrative and economic power among different level of government (local, regional, central, federal, and international), the frequent involvement of private organizations in public service delivery, and the proliferation of private-public partnerships have reframed the notion of leadership, giving birth to a new form of public sector leadership emerging across organizational borders.

In all these cases, leadership skills are associated with integrated leadership capacities or to relational leadership skills. Effective leadership is mostly related to the ability to manage diversity within and across public sector organizations in terms of managing different educational backgrounds and professional experiences. Sun and Anderson (2011) complement this attitude with what they call "civic capacity," which they define as the desire to be involved in social issues and the ability to seize social opportunities by becoming "social entrepreneurs." In their framework, it seems that "civic connections" (i.e., the social capital that characterizes the internal and external relations of the leader) and "civic pragmatism" (i.e., the ability to translate social opportunities into reality using mechanisms of collaboration, governance, and accountability) result in higher levels of motivation and commitment within the workforce, favoring "personal empowerment and arousing a feeling of personal ownership" of the processes.

## Public Sector Leadership: Impacts

Despite the growing attention to public leadership as an intersector and interorganizational phenomenon, the majority of studies addressing public leadership as an independent variable focus their attention more on the internal impacts of leaders' work than the external ones. Among the most widespread impacts are variables related to staff, such as increased intrinsic or public service motivation, increased job satisfaction (defined as the

"sense of pride and personal fulfillment that emerges from carrying out a specific job," increased organizational commitment (affective, normative, and continuous), and an improved "speak up" attitude of employees, who feel able to express their opinions.

A growing body of literature is, however, addressing organizational impacts, such as the ability of the organization to achieve the objectives defined by its statute, overall staff participation in achieving company objectives, efficiency (i.e., the ability of the organization to efficiently accomplish tasks), and effectiveness (i.e., the ability to achieve formally set target performances). Other studies look at the organizational impacts of leadership by applying to the public context certain mediated constructs, such as innovation success (which concerns not just the process of generating new ideas or knowledge but also how they are applied to a specific public context), performance information use (i.e., the degree of the use of data on the efficiency, quality, and effectiveness of public services), organizational agility (the ability to perform activities in the shortest possible time), flexibility (the ability to adapt to change), organizational competence (the ability to achieve a set of organizational objectives), and, finally, reactivity (the ability to identify changes and exploit emerging opportunities).

When the independent variable, the construct of public leadership, explicitly refers to an integrative and collaborative process involving multiple stakeholders, the dependent variables are more outside-driven. Fitzgerald et al. (2012) demonstrate how distributed leadership among managerial and professional actors positively impacts the quality of public services in networks. The items used by the two authors to measure this variable are linked to the ability of the network to achieve the goals. These items include the presence within the network of elements like trust, collaboration, frequency of relationships, and mutual support among network members. Finally, the ability of the leader to influence the decision-making process within the group is used as a proxy of the adopted governance model.

## Public Sector Leadership: Implications for the Practice

Whether leadership is a matter of nature or nurture is an unresolved question, but it is being investigated not only in scholarly research but also in executive education and practice. If public leaders are not born as such, what can be done to develop public leadership skills? A widespread answer to this question has been the burgeoning of so-called leadership frameworks conceived either as a set of idiosyncratic skills and behaviors necessary for executives working in public agencies or general frameworks outlined at the national level for central and local governmental bodies. For example, comparative studies on European senior civil service systems showed not only the wide diffusion of government leadership frameworks but also a convergent set of competencies. These competencies can be grouped into the following categories: inspiring, motivating, and managing the staff within the typical boundaries of civil service management (i.e., bureaucracy, red tape, low effective pay for performance, etc.), creating public value, delivering effective and measurable results, supporting and driving strategic decision-making to inform the policy process, leveraging the contributions of stakeholders, and co-producing opportunities. Leadership frameworks serve as referents for recruitment and selection processes and guide and inspire development and training policies for public managers.

At the same time, sector-specific features of leadership frameworks have relevant implications for the development of training programs by schools and universities. Research in this field highlights that when leadership programs are designed and imposed from the top down, the effect on leadership development is narrow. Once public executives are permitted to autonomously co-produce the programs, they develop leadership skills that could make them better managers and better at seizing and widening their career opportunities. However, the most effective way to build leadership skills in public sector managers and develop effective public sector leaders is still a neglected question and, thus, constitutes a promising field of research.

# Public Sector Reforms in Central Asia

Colin Knox
Graduate School of Public Policy, Nazarbayev University, Astana, Kazakhstan
Ulster University, Belfast, UK

## Synonyms

Government effectiveness; Voice and accountability; Corruption; Democracy

## The Context

Central Asia is located at the heart of the Eurasian continent and has a population of some 73 m people. It comprises five republics which gained their independence following the collapse of the Soviet Union in 1991: Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan. Central Asia is landlocked between Russia in the North, China to its East, and Iran and Afghanistan in the South, although Kazakhstan and Turkmenistan border the Caspian Sea, which is not an open sea. Its large energy reserves and location in Eurasia has made Central Asia an important geopolitical player. Russian interests in the region are exemplified through the Eurasian Economic Union (modeled on the European Economic Community; EU, 2016) which was formed in 2000 to promote economic integration between Belarus, Kazakhstan, Russia, Kyrgyzstan, Tajikistan, and subsequently Uzbekistan (in 2006). China's interests in the region link to the Belt and Road Initiative, a series of overland (belt) corridors and maritime (road) of shipping lanes following the ancient Silk Road that will connect China to Central and Southeast Asia en route to Europe. See Table 1 for an overview of the five countries which make up Central Asia.

The five republics have been on different trajectories since gaining independence from Russia, although all depend on presidents/heads of state

**Public Sector Reforms in Central Asia, Table 1** Central Asia data

| Country | Land area ($km^2$) | Population (millions) | Population density ($p/km^2$) | GDP per capita (2011 PPP$) | HDI (out of 1.0) | HDI rank (out of 189 countries | Capital city | Official language |
|---|---|---|---|---|---|---|---|---|
| Kazakhstan | 2,699,700 | 18.6 | 7 | 24,056 | 0.8 | 58 | Astana | Kazakh Russian |
| Kyrgyzstan | 191,800 | 6.2 | 32 | 3393 | 0.672 | 122 | Bishkek | Kyrgyz Russian |

World Bank Country Reports (2018)

who assume prominent leadership roles, ostensibly to protect and maintain internal stability but in practice to preserve power and control in the hands of elite leaders (Kazakhstan, Nursultan Nazarbayev; Uzbekistan, Shavkat Mirziyoyev; Tajikistan, Emomali Rahmon; Turkmenistan, Kurbanguly Berdymukhamedov; and Kyrgyzstan Sooronbai Jeenbekov).

Kazakhstan, which is rich in oil, minerals, and arable land, sees itself as the region's economic leader attracting relative success in trade and investment. It has also created legal conditions which promote easy access by foreign investors and is making efforts to diversify its economy. Turkmenistan has among the top gas reserves in the world (estimated by the World Bank to be the fourth largest, representing about 10% of global reserves) but, at the same time, is "one of the world's most isolated and oppressively governed countries" (Human Rights Watch 2019). Uzbekistan is also rich in natural resources, the most populous in the region, and under a new political leader since 2016 has moved from a position of self-isolation to one which welcomes collaboration with regional partners and is pushing ahead with economic modernization. The latter involves ambitious plans to liberalize the economy by reducing the role of the state and facilitating private sector growth. Kyrgyzstan and Tajikistan are the smaller and least developed states in Central Asia, both of which received significant international aid funding. Tajikistan became embattled in a 5-year civil war immediately after independence and has struggled to maintain instability since. Its economy is largely based on agriculture, cotton-growing in particular, but it also has rich mineral resources. Although it has achieved some success in poverty reduction, it has low-quality public services such as electricity, water, heating, and roads. Kyrgyzstan has also experienced political turmoil and instability following independence. Social unrest largely over corruption and nepotism during 2005–2010 resulted in Kyrgyzstan developing a parliamentary constitution (2010) which created checks and balances aimed at avoiding supreme presidential power. As a result, Kyrgyzstan is the only Central Asian state where the president can run for one 6-year term of office in a parliamentary-presidential system of government. In a review of Central Asia, 25 years after independence (2016), Batsaikhan and Dabrowski (2017: 318) concluded:

> All Central Asian countries… face the same challenges of oppressive and predatory post-Soviet states. These are deeply rooted causes of corruption, rent-seeking, state capture, administrative harassment of business and more broadly, a high degree of business uncertainty and insecurity over property rights. The situation looks particularly bad in all areas where economic management interacts with authoritarian political systems and legal institutions, especially those related to the judiciary, law enforcement agencies and public administration.

## Existing Research

In a symposium edition of the *International Journal of Public Administration* published in 2011 entitled *Public Sector Reform in Central Asia*, Dixon and Common argued that although there was evidence of market reforms in all five republics such as deregulation, marketization, contracting out, public-private partnerships, and privatization initiatives, these have not always resulted in improved market outcomes. Concomitant administrative reforms proved even more challenging. Dixon and Common suggested that limited public sector reform in Central Asia could be explained by the lack of political consensus on reforms where bureaucracy was used to copper-fasten elite political power and the need to change the politico-administrative culture. They concluded:

> That state administrative failure—dysfunctional public institutions—and poor governance go hand-in-hand is uncontroversial but is good governance conditional upon having strong state administration? Certainly, a set of strong state institutions can deliver public policy outcomes and public services beneficial to a society, but it can also be oppressive, leading to a diminution in the quality of societal governance (Dixon and Common 2011: 554).

Researchers from each of the Central Asia countries offered an overview of public sector reforms during the period 1991–2000 which provides a useful baseline exercise.

Baimyrzaeva (2011) offered a comprehensive overview of public sector reforms in Kyrgyzstan and describes the period as one where the

administrative system experienced many formal institutional changes but practice did not improve. These changes, she argued, "had been unsystematic and mostly cosmetic" focusing largely on legal, technical, and organizational changes. In practical terms "there was a fair amount of counting outputs of reforms, such as the number of laws passed, the number of ministries that underwent functional reviews, and the number of computers allocated to government ministries. . .accounts of the actual outcomes were rare" Baimyrzaeva (2011: 559). This account is typical of public sector reforms in Central Asia where process trumps product. There is a preoccupation with, and abundance of, laws, strategies, directives, and speeches from the president/head of state with poor implementation capacity and limited or no attention to policy evaluation. In a case study of the agricultural sector Rural Advisory Service in Kyrgyzstan, Ritz and Voegtli (2011: 595) described the introduction of a results-based payment system. The system created targets and incentives for the advisory service to support farmers and boost their income and more generally to "initiate a shift from an input-oriented budget system to the results-oriented mandate system" – a key component of public management reforms.

Amagoh (2011) examined the same period (1991–2000) in Kazakhstan through the lens of a case study in healthcare reforms outlined in the National Program of Health Care Reform and Development (2005–2010). He used the framework of public management (decentralization, competition, efficiency and quality, civil society, and partnerships) as the benchmark to track the progress of healthcare reforms under the program. Amagoh (2011:576) concluded that Kazakhstan offered evidence of meeting international standards in health care and was "addressing the various shortcomings inherited from the Soviet era. Kazakhstan has followed the global trends of public management reform and introduced a number of changes in the health sector." While he concluded it was too early to realize the full benefits of these reforms, he was sanguine about the early results.

Bhuiyan (2011: 613) examined the early implementation of e-government and its impact on public services in Kazakhstan and argued that although it was not fully satisfactory, "e-government is being increasingly used to improve transparency and accountability and to curb corruption. As a result, the Government of Kazakhstan has been successful in delivering a number of public services to its citizens through electronic means. Thus, it has demonstrated the benefit of e-governance."

Janenova and Suk Kim (2016) researched the introduction of one-stop shops in Kazakhstan as a means for integrating public service provision and offering greater accessibility for citizens. While they are generally positive about this development, there were limitations associated with the institutional framework and embedded culture of the Kazakhstani bureaucracy which exhibited resistance to change. Janenova and Suk Kim (2016: 332) concluded that there were lessons for other transitional countries from their work in that they needed to engage in critical thinking and in-depth analysis of their own public sector cultures "before Western managerial reforms can be implemented. Otherwise, the government risks falling into the trap of "fashionable approaches", while overestimating the positive outcomes of the new ideas and underestimating the negative drawbacks."

Kassen (2018) provided an update on e-government in Kazakhstan with a very comprehensive overview of its history and evolution. He argued that e-government has been "the number one priority in advancing all administrative projects" culminating in an e-government ecosystem for many interactive and transactional public services, including open government platforms which will "change completely the nature of government-citizens interactions." He concludes that Kazakhstan is now being considered as "one of the first of the pioneers in introducing digital government technologies in the developing world" and e-government offers the prospect of transparent government in a society rarely exposed to the core principles of public administration.

Aminova and Jegers (2011: 580) examined the progress of public sector reforms in Uzbekistan during the same period, arguing that importing market-based recipes from Western societies

proved inappropriate. Instead they highlighted the presence of informal structures, sociocultural mechanisms, and cultural artifacts which "filled the emerging vacuum in the areas where formal mechanisms were weakened, non-existent, or only emerging." These informal mechanisms and social processes were, and continue to be, important in Uzbekistan because people lack trust in government. As a result, formal and informal institutions overlap, with the latter having a significant impact on public policies. Aminova and Jegers (2011) concluded that this impact can be both constructive and destructive: they expedite decisions and are inclusive of those impacted by them; and they could result in the growth or entrenchment of vested interests which are vulnerable to corruption and lobbying, respectively.

Knox (2019) provides the most recent overview of public sector reform in Central Asia and the Caucasus. He compares the reforms in three countries, Kazakhstan, Azerbaijan, and Georgia, using research evidence which suggests that the New Public Management model has had limited success in developing countries. Instead Knox proposes moving to a combination of outcomes-based accountability for public services and peer-to-peer learning as the basis for raising the quality of people's lives through better public services.

## Contemporary Issues

There are four themes which run through the research on public sector reform in Central Asia: government effectiveness, voice and accountability, corruption, and democracy, none of which indicate much signs of improving (materials below draw on Bertelsmann Stiftung country reports and World Bank metrics).

### Government Effectiveness

Kazakhstan shows most progress in terms of government effectiveness partly associated with the reduction in the size of the state apparatus, but it has also an ongoing program of civil service reforms. It has overhauled its recruitment and selection process, but these continue to be influenced by political involvement and nepotism. There is a plethora of strategies, presidential speeches and directives, but poor evidence of implementation. Often in Central Asia, reforms are structural, reshuffling ministries, functional reviews, and mergers. These give the appearance of reform activity but rarely result in better quality public services. Kyrgyzstan is an example writ large of constant restructuring, including the replacement of the prime minister and a number of cabinet ministers resulting in a policy implementation deficit. Over a 10-year period, Kyrgyzstan has shifted little on the metrics of government effectiveness (see Fig. 1). It has a large public administration system, but officials are poorly paid and lack competence and motivation. Tajikistan receives funding from foreign donors to assist in public policy reforms through study visits abroad and a reliance on their advice to improve government effectiveness. This appears to have limited impact (see Fig. 1) not least because the governance system is highly centralized and appointments are politically motivated. Turkmenistan is a closed country which eschews liberal democratic values and is repressive in many aspects of life. It ranks lowest in terms of government effectiveness in the five Central Asian countries. This is partly due to the fact that capacity levels are low in the civil service and decision-making vested almost entirely in the hands of the president. This results in poor coordination of public policies which are at the whim of the president and a reluctance on the part of officials to take decisions for fear of retribution. Uzbekistan has witnessed a significant improvement in government effectiveness, in part as a result of the election of President Mirziyoyev in 2017. He appears to support greater engagement with the public to improve administrative reforms in decentralization and modernization of state management. Whether these processes result in a long-term trend in improving government effectiveness remains to be seen.

### Voice and Accountability

Voice and accountability, not surprisingly, in authoritarian states is limited. Kazakhstan is working extensively with the OECD to improve this facet of governance, but, to date, changes are largely tokenistic and part of a wider agenda for Kazakhstan to become one of the top 30 developed

| | 2007 | 2012 | 2017 |
|---|---|---|---|
| Kazakhstan | 30.58 | 40.28 | 53.85 |
| Kyrgyzstan | 23.79 | 29.86 | 23.08 |
| Tajikistan | 13.11 | 18.01 | 12.98 |
| Turkmenistan | 4.85 | 9.48 | 10.1 |
| Uzbekistan | 12.14 | 18.48 | 32.69 |

**Public Sector Reforms in Central Asia, Fig. 1** Government effectiveness in Central Asia. (Source: calculated from Worldwide Governance Indicators 2018 Kaufmann et al)

countries by 2050. Its chairmanship of the OSCE in 2009 could have acted as a mechanism for improving voice and accountability, but the mass media remains largely in the purview of the state, and social media can be restricted or closed down for periods of time. Kyrgyzstan, because of the experience of two "color revolutions," might suggest a greater role for voice and accountability, but there is a certain amount of confrontational fatigue among its citizens and a realization that conflict has not served the country well. So, although Kyrgyzstan appears to be more outward facing, this has not always translated into open government and tends to be personality dependent among heads of government who change repeatedly. There is therefore no consistency in this approach even though Kyrgyzstan has the highest ranking for voice and accountability in the Central Asian states by a significant margin. Tajikistan has a weak civil society offering no alternative voice to government, and those groups which receive foreign support are distrusted as having a Western agenda. Journalists face libel and defamation charges should they report on corruption cases involving officials. Turkmenistan has a loyal and patriotic population with an underdeveloped civil society but one which is tribalized and where the president exercises repressive powers in the face of any dissent or an alternative voice. Trophy projects at the behest of the president such as a large national tourism zone in Avaza and an Olympic Village to host the Fifth Asian Games meet with limited protest from the public. Turkmenistan ranks the lowest on the metric of voice and accountability by a long way in Central Asia (see Fig. 2). Uzbekistan under the new president appears as to be making some efforts to engage with the public. In 2017, for example, President Mirziyoyev declared 2017 the Year of Dialogue with People and Human Interests where he attempted to bridge the gap between state officials and the public. The extent to which this will make a difference remains to be seen, but there has been a small increase in the metric for voice and accountability in Uzbekistan.

## Corruption

Once again Kazakhstan is doing better in terms of tackling corruption than other Central Asia states, although still relatively modest. In 10 years it has improved its performance from 17.48 (out of 100) to 19.71. This is hardly a significant achievement but the best in Central Asia. Kazakhstan has adopted several anti-corruption strategies, but still high-profile scandals dominate in projects like Expo 2017 and pensions reform. The Agency on

| | 2007 | 2012 | 2017 |
|---|---|---|---|
| Kazakhstan | 15.38 | 15.02 | 13.79 |
| Kyrgyzstan | 20.67 | 28.64 | 33 |
| Tajikistan | 10.58 | 8.45 | 4.93 |
| Turkmenistan | 0.96 | 0 | 0.99 |
| Uzbekistan | 1.44 | 1.88 | 3.45 |

**Public Sector Reforms in Central Asia, Fig. 2** Voice and accountability in Central Asia. (Source: calculated from Worldwide Governance Indicators 2018 Kaufmann et al)

Fighting Economic and Corruption Crimes also known as the Financial Police have shown few results, although they publicize their successes widely. Kyrgyzstan is dogged by public sector corruption. The current president claimed tackling corruption to be one of his top priorities but with limited impact on the problem. Those anti-corruption measures put in place have not been implemented and/or have limited substance. The public procurement process involves government-run tender auctions that are prone to political influence and manipulation. This is an area which is particularly vulnerable to corruption. Tajikistan appears to be getting worse in terms of corruption and has no anti-corruption strategies in place to tackle the problem. The task of addressing corruption is vested in several government ministries and agencies and hence lacks coordination and can be scapegoated. Turkmenistan, once again, has the inglorious reputation of being the worst state in Central Asia for corrupt practices by a significant margin (see Fig. 3). Although it adopted the first anti-corruption law in 2014, the problem is rife in the state sector, in particular the judiciary, security, education, and health sectors. There was a public purge of high-ranking officials on corruption charges between 2014 and 2016, but little has changed, and the media do not have access to information on cases of corruption. Uzbekistan adopted a Law on Combatting Corruption in 2016, the first law the new president signed on coming to power. The metrics show that there has been an improvement in performance in tackling corruption in Uzbekistan, but it is too early to judge if this represents a consistent trend.

## Democracy

Are there any signs of Central Asia moving from authoritarianism to democracy through public sector reforms? Kyrgyzstan offers the best prospect given its willingness to be open to dialogue between people and the state and attempting to embrace the principles of open government. President Nazarbayev of Kazakhstan retains a firm grip on power and the organs of the state. In Tajikistan the president extended family controls over many of the high-profile appointments. Turkmenistan is essentially anti-democratic in character with no signs whatsoever of a commitment to liberal democracy. Again Turkmenistan scores lowest in Central Asia on the democracy index, and Uzbekistan is only marginally better. Plotting governance scores from the Bertelsmann Transformation Index against democracy for Central Asia countries over a 12-year period (2006–2018) show a strong correlation between democracy and good

| | 2007 | 2012 | 2017 |
|---|---|---|---|
| Kazakhstan | 17.48 | 18.96 | 19.71 |
| Kyrgzstan | 5.34 | 11.37 | 12.98 |
| Takijistan | 15.53 | 6.64 | 7.69 |
| Turkmenistan | 1.94 | 1.9 | 4.33 |
| Uzbekistan | 16.02 | 4.74 | 12.02 |

governance ($R^2 = 0.64$, see Fig. 4). It is doubtful if this evidence would feature in the minds of authoritarian leaders.

## Conclusion

Central Asia is a mixed bag of public sector reforms with Kazakhstan as the regional leader and Turkmenistan the worse in a number of areas. The former is more open to innovation around digital government but reluctant to countenance digital democracy and open government. The latter is repressive and essentially anti-democratic. Kyrgyzstan, on the back of colored revolutions, sees a role for actively working with the public and has benefitted from collaborating with external funding organizations. Tajikistan shows significant fluctuations in government effectiveness, marginally better than Turkmenistan. Uzbekistan is a work in

progress, and the new regime has yet to make significant medium-term gains. Where there has been some evidence of Western influence, it has been in the area of public management, specifically decentralization and optimization of public services; privatization, outsourcing, and public-private partnerships; limited anti-corruption measures; and greater transparency through one-stop shops and electronic government. The situation remains however that Central Asia, comprising five authoritarian states with monopoly powers in the hands of the president and elite groupings, is likely to continue, in part as a legacy of the Soviet Union. There is little evidence that this will change in the short term and, as a result, the potential for significant public sector reforms drawing on Western models remains limited.

P

## Synonyms

Equality; Public administration reforms; Social inclusion

## Definition

Public Sector Reform with Social Inclusion is a government reform that includes three main pillars: (1) Growth that creates adequate productive employment – especially for the purpose of poverty reduction; (2) a comprehensive set of decentralized social policies and services especially in education and health services provided universally across the population as a right and funded by the growth dividend; and (3) capacity of the state machinery and political feasibility to implement growth with redistribution.

## Introduction: Social Inclusion and Public Policies

Social equity provides the underpinning for a just society. It influences behavior in organizations and it serves as the practical and legal basis for distributing public goods and services (Frederickson 1990; Harmon 1974; Rawls 1971). The pursuit of social equity was embraced by the New Public Administration (NPA) trend originated in the late sixties at the Minnowbrook Conference. The NPA emphasized the impact of public policies on the population and a more normative orientation to public problems (Kumar 1987). This aspect parallels efforts among public administration scientists to analyze and evaluate policy outcomes, especially assessing the impact of public policies implementation. In this vein, a number of scholars have conducted research on public policies addressing social inequalities.

Researchers found that sound social policy can contribute to economic growth as well as welfare (UNRISD 2010, p. 15). But economic growth does not necessarily mean the diminishing of social and health inequalities. In fact, some scholars found that during economic expansion, health can worsen rather than improve (Granados 2005; Ruhm 2005; Catalano 2005). Likewise, economic growth is not necessarily required for improvements in health, even in developing countries. For instance, in Haiti some progress has been made to improve health and education, while economic growth is still a challenge.

## Public Sector Reforms with Social Inclusion

Recent public sector reforms in Bolivia and Haiti tackle social inequalities on the three main pillars aforementioned. One, growth that creates adequate productive employment – especially for the purpose of poverty reduction. Creating productive employment is a challenge for most governments in developing economies. In fact, in some economies, government is perceived as a source of jobs and/or is expected to create jobs. The task may become a problem especially in low-income countries with severe economic and social crises. For instance, in Haiti, after the 2010 earthquake, the government with the aid of the donor community implemented many reconstruction projects, which served as a source of jobs for the affected population.

Two, a comprehensive set of decentralized social policies and services especially in education and health services provided universally across the population as a right and funded by the growth dividend. In many developing economies, decentralization has turned into a key strategy especially in education and health services. For instance, major government programs in Bolivia and Haiti addressing education inequalities have been successful at the national and local levels. An important factor in keeping up is the continuous training of public education staff and improving school facilities at the regional and local levels.

Three, capacity of the state machinery and political feasibility to implement growth with redistribution. Recent studies on ways to address health inequalities show that income redistribution along with other societal policies and programs, such as primary health care, public education, and social security, will help reduce or eliminate health inequities (Starfield and Birn 2007). However, health inequalities may persist even in countries with relatively low-income inequality. Other possible solutions to health inequalities include paying greater attention to the ways in which the inequality agenda is embedded within local monitoring and decision-making processes. This is a trend in Bolivia. Traditionally, local government has played a key role in public health through its work on sewers and sanitation, food hygiene, and environmental health.

But effective implementation of decentralized policies requires an adequately trained and motivated public officials cadre. Motivation initiatives may include monetary and nonmonetary incentives such as professional development, family-friendly policies, opportunities for advancement, and workplace diversity policies.

Public sector reforms with social inclusion are better understood by briefly referring to reforms efforts in two Latin American countries: Bolivia

and Haiti. These two countries are decidedly different on some dimensions, but similar in their failed efforts to tackled widespread poverty, in part due to weak institutional capacity and unskilled government officials. Some contextual information is in order.

Bolivia is a resource-rich country with a growing economy. Nevertheless, the country remains one of South America's poorest countries and one of the world's most unequal societies. Bolivia's Income Gini coefficient for 2013 is 56.3, the highest value in South America (UNDP – Human Development Reports 2013). Likewise, on the Global Hunger Index, Bolivia's measurement is the highest across South America and third-highest in the Latin America-Caribbean region, after Haiti and Guatemala (FAO –The State of Food Insecurity in the World 2015). Geographically, Bolivia is a landlocked country characterized by extreme geographical disparities and is frequently hit by natural disasters (e.g., El Niño phenomenon).

Evo Morales has been the President since 2006. Before the Morales administration, the nation suffered a series of political crises characterized by massive social protests. To stabilize the socio-economic situation of Bolivia, Morales led a decisive political change that resulted in the draft of a new Constitution, which was adopted in a referendum in 2009. In general, the 2009 constitution establishes a series of social rights. For instance, the right to water and food, the right to universal and intercultural education and the right to health without any exclusion or discrimination. It also prohibits the privatization of public social services related to the supply of water/sewage, public health, and social security (Bolivia's (Plurinational State of) Constitution of 2009, Articles 16–20).

Bolivia's economy has continuously improved since 2006 primarily due to a substantial increase in revenues from the export of hydrocarbons, minerals, and agricultural goods. Gas accounts for roughly 50% of Bolivia's total exports (CIA 2016). According to World Bank data, GDP per capita has increased from $4438.7 (2006) to $6953.8 PPP dollars (2015). Likewise, Bolivia's Human Development Index (HDI) score has increased from 0.600 in 2000 to 0.662 in 2015, giving the country a rank of 119th out of 187 countries (UNDP – Human Development Reports 2015).

The Morales administration has significantly increased the role of the state in the economy. For instance, international gas companies were forced into new contractual relationships and so taxes on gas companies were increased. The revenues from them have been used to sustain welfare programs (mainly conditional cash transfer programs) such as the "Bono Juancito Pinto" (2006) that is awarded once a year to children in return for continuing their education through the sixth grade of primary school. It annually provides approximately US$29 from over 2 million beneficiaries. The "Renta Dignidad" (2008) is the new universal state pension. It provides grants of US$344–US$$434 for those aged 60 years and above. And the "Bono Juana Azurduy" (2009) supports pregnant women and young mothers if they seek medical care during and after pregnancy. Nevertheless, serious inequalities persist, which in particular affects indigenous peoples, rural areas, and women.

In recent years, a number of reform programs addressing inequalities were implemented in Bolivia. They focused on three dimensions:

1. **Growth that creates adequate productive employment**. For instance, the Canadian International Development Agency – CIDA Bolivian Program 2005–2010. Its principal outcomes were: increased capacity of local/regional governments to plan and manage sustainable development projects and to execute their responsibilities to provide for the betterment of their citizens; improved collaboration and dialogue among extractive sector stakeholders; increased access to markets, property, credit, and technology for up to 35,000 women; improved women's role in decision-making positions in public, private, and civil society sector organizations, reaching 20,000 women; improved access to training for technical and vocational skills for marginalized and young persons; and improved access to jobs in local markets for marginalized and young

persons (Government of Canada, Foreign Affairs, Trade and Development Canada 2014, pp. 11–12).

2. **Decentralized Social Policies and Services Especially in Education and Health Services**. For instance, the Country Strategy 2011–2015 with the support of the IDB. Its principal outcomes include an increase in the number of children below the age of two vaccinated (from 50% to 70%); a 10% increase in services delivered by skilled workers in three departments; and the skills of over 50% of the health personnel updated or upgraded. In Oruro Department, almost 80% of facilities were updated to be user friendly and culturally sensitive. Chronic malnutrition diminished by 28% during the 5-year period of the Zero Malnutrition Program; anemia reduced 80% to 40% in children under 2; maternal and child coverage increased and processes were put in place to guarantee access to quality health services benefiting 228,000 mothers and 125,00 children in isolated areas of Beni and Pando (Government of Canada, Foreign Affairs, Trade and Development Canada 2014, p. 22).
3. **Capacity of the state machinery.** For instance, the CIDA Bolivian Program 2005–2010 and the World Bank Bolivia Institutional Reform 1999–2007. The CIDA's program outcomes were: increased accuracy, transparency, security, preservation, and efficiency of civil registry through a verification process and digitization (digitized over 14,400 civil registry books in 2009 to improve web accessibility); increased transparency and credibility of the electoral process, increased citizen awareness of the importance of registration and voting (e.g., training in democratic/electoral values to 14,600 secondary school student in 2009); increased citizen participation in elections (e.g., higher rate of voter registration and 95% turnout for the 2009 elections); and increased access to government services (e.g., providing over 51,000 birth certificates to undocumented citizens in 2008–2009, and corrected another 46,000) (Government of Canada, Foreign Affairs, Trade and Development Canada 2014, p. 24).

The World Bank's program outcomes were; three pilot agencies under the project receiving intensive support for comprehensive reforms (Internal Revenue, Customs, and Roads) improved their performance, measured in terms of revenue collections (Internal Revenue and Customs) and road construction and maintenance vis a vis preproject baseline indicators, with some adjustment (in the case of revenue collections) (World Bank 2008, pp. 4–5).

Regarding Haiti, the most populous Caribbean country a public policy to transform the country is still in process. Haiti is also the poorest country in the Americas having the lowest Gross National Income per capita of US$ 666 in 2011 (UN n.d. Human Development Index). Over half of its population of 10 million lives on less than US $1 per day (World Bank n.d., *Haiti Overview*). Haiti's 2015 Human Development Index value of 0.483 is also below the average of 0.505 for countries in the low human development group (UNDP 2015, p. 211). The unemployment rate is about 40%. It is high among young people, who represent more than 50% of the entire population (Index Mundi, n.d. *Haiti Age Structure*). This makes unemployment one of the country's main social problems. The country is also one of the world's most unequal societies. Haiti's Income Gini coefficient value for 2013 is 59.2, the highest rate in the Americas and the Caribbean (UNDP – Human Development Reports 2013).

The political system is based on the national Constitution issued in 1987. It opted for decentralization as the strategic path for development. However, for more than 2 decades, now the country is still at initial levels with regard to decentralization. During its political life, Haiti experienced regular political violence that accounted for about 32 coups. For instance, in 2004 a coup d'état forced the resignation of President Jean-Bertrand Aristide. A provisional government led the nation with security provided by the United Nations Stabilization Mission in Haiti. In November 2016, Jovenel Moise, a prosperous banana exporter, was elected President.

Besides socio-political issues, Haiti also suffers from natural disasters. For instance, in 2004 tropical storm Jeanne devastated the north coast of

Haiti leaving a toll of more than 3,000 people dead. In 2008 other tropical storms (tropical storm Fay, Hurricane Gustav, Hurricane Hanna, and Hurricane Ike) caused serious problems to the country. On January 12, 2010, a magnitude 7.0 earthquake struck Haiti deepening existing challenges and caused the death of thousands of people.

To overcome the challenges, Haiti has embarked in reform programs addressing inequalities since 2007 at the nation and local levels. They also focused on three dimensions:

1. **Growth that creates adequate productive employment.** For instance, the National Strategy for Reconstruction and Development (PARDH) (2010), the UN Stabilization Mission in Haiti (MINUSTAH) (2011), and the Growth and Poverty Reduction Strategy (GPRS) (2007). In this sense, since 2010 hundreds of temporary work projects were implemented, including on average 40% women (United Nations 2011, p. 44). These initiatives allowed thousands of families to increase access to income and opportunities to receive specialized training in areas such as debris management, recycling, earthquake-resistant construction, riverbank protection, and watershed rehabilitation (UNDP 2011, p. 6). In 2011 the UN Stabilization Mission in Haiti (MINUSTAH) in collaboration with local officials facilitated the opening of Haiti's first two Youth Counseling and Employment offices. MINUSTAH helped marginalized community members to create economic and social opportunities allowing them to get away from violence and the influence of gangs. In general, the postearthquake era generated thousands of jobs in the reconstruction and infrastructure sector, particularly in the Port-au-Prince area (United Nations Economic and Social Council 2013, p. 3).
2. **Decentralized social policies and services especially in education and health services.** For instance in education, the 2010–2015 Operational Plan for Education, the National Strategy for Reconstruction and Development (PARDH) (2010) and the Haiti-Education for All Program in Support of the Second Phase of the Education for All Program (2011) In terms of health issues, efforts to tackle health inequalities include: The Integrated Social Services Project (2013) and the Rural Water and Sanitation Project (2012). They resulted in an increase of the access to and use of water supply and sanitation services in participating rural communities.
3. **Capacity of the state machinery.** For instance, the National Growth and Poverty Reduction Strategy (200). Trough this program they: (a) published an order on the Organization and Operation of the High Council of the Administration and Civil Service; (b) published an order on the organization and operation of the Office of Human Resources Management; (c) set up the Central Database of Civil Servants; and (d) set up a file for the National School of Administration and Public Policies (IMF 2012, p. 79). However, a sense of who exactly is in the civil service, and what they are doing (i.e., job description) is still unclear.

## Conclusion

Public Sector Reforms programs with social inclusion have been implemented in Bolivia and Haiti aiming to tackle poverty. However, widespread poverty is still a big challenge. Likewise, lack of or weak institutional capacity and an unskilled cadre remain major challenges in those countries.

Both countries opted for decentralization as a means to tackle more effectively economic and social inequalities. But they differ in the level of implementation. While Bolivia has made a significant progress toward decentralization implementation, Haiti is still at incipient level.

Institutional capacity strategies should be intensified in both countries. An institutional framework for a modern public sector and a skilled and competent civil service system need to be developed. But the task requires a strong political will and leadership to bring about the transformation process of the civil service system.

## Synonyms

Public sector consultancy; Strategic planning

## Definitions

| | |
|---|---|
| Consultants | Individuals who conduct specialized studies and recommend specific action plans |

| | |
|---|---|
| Strategy | A plan that includes goals and actions to achieve these goals based on available resources |

This article explores consultancies in the public sector and consultants' role in strategic planning. Consultancies in the public sector pose different challenges when compared to the private sector. Radnor and O'Mahoney (2013, p. 1556) confirm that such differences between the two sectors have been documented, but "material detailing the impact of public sector engagements on the consultancies" has received less attention, and "there is relatively little literature that specifically focuses on the consultancy experience...."

Some organizations engage consultants for the preparation of strategic plans, while others do so "in-house." However, whether strategic planning is an "in-house" effort or prepared by external consultants, involving stakeholders throughout the entire process is imperative (Aldejwi 2014) "in determining eventual ownership of the process" (Bevan 2000, p. 303). "... it is likely that someone inside the company already knows the 'right answer' and unlikely that even the best consultants in the world can come up with a dazzling surprise in six weeks" (Jackson 2010, p. 57). "Management consultants [may] steal your watch and then tell you the time... stories of consulting assignments gone astray [are not unusual, thus you must]... make sure that your consultants earn their keep" (Jackson 2010, p. 56).

Gaps in public sector consultancy (Radnor and O'Mahoney 2013) are evident in extant literature. In addition, George (2017) questions whether strategic planning "works" under public sector conditions. Also, "there are few studies. . .which examine the impact of public sector engagement on the products that consultancies develop" (Radnor and O'Mahoney 2013, p. 1555). Thus, there is still much to learn "about the efficacy or 'success' of such consultancies" (Bevan 2000, p. 289).

## Maritime Safety Authority of Fiji (MSAF)

MSAF was established as a Commercial Statutory Authority (CSA) in 2011 (MSAF 2012). For 2012 and 2013, the MSAF Board decided that external strategic planning facilitators be engaged to facilitate MSAF's inaugural and second strategic planning process and documentation of MSAF's strategic documents. In 2014, the MSAF Board opted to utilize an internal facilitator.

### 2012 – Facilitator #1

An external consultant was engaged who carried out extensive strategic planning training of both the management and staff. He also carried out SWOT analysis as well as conducted four workshops over 8 days (supporting management in compiling critical data and developing draft MSAF strategic documents) and a 2-day strategic planning workshop (including government and maritime industry representatives, MSAF Board members and, management and staff). Draft strategic documents were finalized by the external consultant and vetted by the CEO in quarter 1, 2012 with approval granted by the Ministry of Public Enterprises in 2013. Nevertheless, these strategic documents only come into effect when approved. MSAF management was left with no other choice but to implement the draft strategic documents in 2012, as though documents were approved.

### 2013 – Facilitator #2

Another external consultant was engaged to facilitate the strategic planning process and the documentation of MSAF's strategic documents. This consultant carried out data collection, conducted a 1-day strategic planning workshop (including the same key stakeholders as consultant 1), and developed draft MSAF strategic documents. The consultant opted for limited interface with MSAF management and staff throughout the consultancy. Draft strategic documents were finalized by the consultant in quarter 2, 2013, with approval granted by the Ministry of Public Enterprises in 2014. MSAF management opted not to implement the draft 2013 strategic documents which left MSAF somewhat directionless in 2013.

### 2014 – Facilitator #3

The MSAF Board decided that "in-house" facilitation of MSAF's strategic planning process

and strategic document preparation be undertaken by MSAF's CEO. The facilitator requested heads of departments (commencing September 2013) to source, analyze, and compile data (and undertake a SWOT analysis) and to draft their departmental sections' strategic documents for presentation, discussion, and in-principle approval by the MSAF Board in a 2-day strategic planning workshop. Cross-functional meetings were facilitated with department heads to ensure departmental analyses are consolidated into meaningful strategic presentations and documents. A 2-day strategic planning workshop in November 2013 (including the same key stakeholders as consultant 1) netted MSAF Boards' in-principle approval of the draft strategic documents. Draft strategic documents were finalized by this facilitator in quarter 2, 2014. However, this was not formally approved by the MSAF Board due to the imminent expiration (in September 2014) of the CEO's employment contract and the desire of the Board to allow an incoming CEO to prepare strategic documents. The MSAF 2014 strategic documents were never approved. MSAF management was thus left with no choice but to implement the draft strategic documents in 2014, as though the documents were approved.

MSAF's former chairman directed that no strategic planning documents be prepared until recruitment of a replacement CEO. Up until recently, only an acting CEO had been appointed. Additionally, MSAF has been without a Board since May 2015; however, a new Board has been appointed in 2018. No strategic documents have been published by MSAF since 2013.

## Strategic Planning Process

The strategic planning model and methods adopted by the three strategic planning facilitators were confirmed by the facilitators as being based on modified versions of Bryson's (1995) linear, ten-step strategic planning process (Fig. 1).

Each facilitator tailored process steps based on their preferred approach and peculiarities of the enterprise and environmental conditions at that time.

### Step 1: Initial Agreement

Facilitator 1 confirmed through meetings the line Ministry, Board, and CEO's commitment to the strategic planning process; however, management and staff were initially not in agreement or

**Public Sector Strategic Planning Facilitation: Developing Country Perspective, Fig. 1** Strategic planning process

committed as they lacked foundational understanding of strategic planning and the need for such. Facilitator 2 also confirmed the Ministry, Board, and CEO's commitment to the strategic planning process. However, only one introductory meeting was arranged with the management. Management was informed that they would be required to participate in the strategic planning process by provision of requested information. The facilitator adopted a directive, top-down approach and presumed the right decision-makers were represented in the management, who clearly understood the process and willingly participated in the process. No planning group was established, no training was provided, and no agreement, commitment, or support for the process by the management was achieved. To the contrary, MSAF management expressed offense at the approach adopted by the facilitator. Facilitator 3 (the CEO) was aware of the Ministry and MSAF Board's commitment to the strategic planning process and was equally committed. This commitment was also evident and confirmed by the management and key staff. The CEO agreed to the strategic planning process suggested by management and the proposed strategic planning group, and an inclusive and delegated approach was adopted.

### Step 2: Organizational Mandates

MSAF was bound to comply with domestic legislation [Public Enterprise Act (1996), MSAF Decree (2009), and the Marine Act (1986)] that spell out the governance structure, purposes, functions, and particulars relating to MSAF as a CSA and also to international maritime safety conventions of the International Maritime Organization (IMO). These mandates were understood by the CEO, MSAF management, and key staff; however, these needed to be explained to Facilitators 1 and 2.

### Steps 3 and 4: Vision (3), Mission, and Shared Values (4)

Each strategic planning facilitator developed the vision statement early in the strategic planning process (at step 3) and contrary to Bryson's ten-step strategic planning process where the vision statement is developed at step 8. Facilitator 1 established MSAF's inaugural mission statement (with input from the planning group and stakeholders). This mission statement remained unchanged by Facilitators 2 and 3. Facilitator 1 also established MSAF's core values (with input from the planning group and stakeholders). Ironically, Facilitator 2 maintained the inaugural mission statement that referenced the core values of MSAF yet did not stipulate any core values in the strategic plan. Facilitator 3 retained the inaugural core values which were documented in the strategic plan.

### Step 5: SWOT

Facilitator 1 carried out a SWOT analysis involving participants (management, staff, and external stakeholders). Facilitator 2 did not carry out a SWOT analysis, rather opted to undertake a stakeholder analysis to identify potential parties impacted by the strategic plan, what was relevant to those parties, and their current and future expectations of MSAF. Facilitator 3 carried out the same analysis as Facilitator 1.

### Step 6: Strategic Issues

Facilitators 1 and 3 identified a series of "challenges" that would impact MSAF's service provision and strategies adopted, covering the timeframe of the strategic plan. Facilitator 2 opted not to identify any strategic issues and relied solely on stakeholder analysis.

### Step 7: Strategies to Meet Objectives

Facilitators 1 and 3 (by consensus with the management group) listed strategic actions planned to be taken to address the issues identified and to enable goals and objectives to be met, whereas Facilitator 2 opted not to identify impediments and associated activities to address those impediments.

### Step 8: Simple, Practical Implementation Plan

Facilitators 1 and 3 (by consensus with the management group) documented logical and workable implementation plans to bring about strategic ends. Facilitator 2 compiled organization-wide metrics and ratios for each

functional area, covering a 3-year period and a Corporate Performance Framework for 2013. Accountability for attainment of metrics and ratios was not specified. Considering Facilitator 2's limited involvement of management in this process step and limited explanation provided (regarding the metrics and ratios), management and staff did not understand the projections and, hence, did not commit to attain such.

### Step 9: Re-evaluation, Approval, and Implementation

Facilitators 1 and 2 followed this step, ultimately resulting in approved strategic plans for implementation; however, both facilitators were not engaged in implementing the strategic plans. In spite of the delay in drafting and approval of the inaugural strategic plan, the unapproved strategic plan was implemented by management and staff. Management and staff were not committed to implementing the strategic plan developed by Facilitator 2. The plan was thus not implemented, leaving the enterprise directionless in 2013. The strategic plan developed by Facilitator 3 was not formally approved by the MSAF Board due to the pending expiration of the CEO's contract of employment. MSAF management, therefore, opted to implement the unapproved strategic plan, rather than leave the enterprise directionless in 2014.

### Step 10: Reassess Plan and Process

MSAF management reviewed progress and made adjustments (where necessary) toward attainment of the strategic plans implemented and reported on a biannual basis to the Board and line ministry and annually to the Minister for Public Enterprises.

### Findings

The three strategic planning facilitators espoused to MSAF management and staff the criticality of planning and formulation of strategy to strategic planning. Only Facilitators 1 and 3 established inclusive, empowered, cross-functional management and staff planning groups that were actively engaged in planning and formulating the process and allowed for buy-in, collaboration, and ultimately commitment by those group members, resulting in simple, implementable strategic plans. While the inaugural strategic plan was implemented, the strategic plan facilitated by Facilitator 3 was not implemented due to a Board decision relating to recruitment of a CEO. Facilitator 2 merely set aside 1 day to meet the MSAF management individually and adopted a mechanical, top-down approach which alienated and offended management and staff. Hence, poor commitment of management and staff to the strategic planning process resulted in the non-implementation of the strategic plan.

Due to promotion of a high degree of vertical and horizontal communication, Facilitator 1 was able to establish a high degree of employee strategic planning perception congruence which supported strategic planning and implementation. Facilitator 2 failed to communicate and develop congruence; hence strategic planning was "painful" as indicated by employees, and management were disinterested in and unwilling to implement the strategic plan. Facilitator 3 was only able to establish congruence at the Board and planning group levels; hence, strategic plan implementation would have been challenging. Management were congruent with Facilitators 1 and 3 and with the unified direction provided to employees by Facilitator 1. Facilitator 3 failed to gain unification of direction with employees as the strategic plan was never approved. However, because management did not agree with the facilitation approach adopted by Facilitator 2, management was not congruent with Facilitator 2, and this disunity was evident to employees.

Facilitators 1 and 3 supported the planning groups through provision of extensive planning training, communication, encouragement, and motivation and encouraged communication among departments and sharing of goals. These facilitators ensured that planning group members were removed from their day-to-day roles (for planning group meetings and activities) for the absolute minimum time, so as to mitigate the impact on their workloads. These facilitators educated planning group members sufficiently to help them realize and accept that organizational

direction and interests take precedence over personal and functional interests. In contrast, Facilitator 2 spent such minimal time with management that their responsibilities were only marginally increased. Under these circumstances, personal and functional interests did take precedence over organizational direction and interests as management was not committed to the organizational planning process.

Facilitators 1 and 3 established planning groups with member selection as agreed by senior management. Training and coordination of the planning groups by those facilitators allowed the opportunity for experimentation and creativity by planning group members. Facilitator 2 opted not to establish planning groups, rather merely met with management individually over 1 day to source information and provided no training or coordination. This resulted in management disengaging from the strategic planning process, the "know-how" of management neither being harnessed nor developed, and produced a strategic plan "they [management and staff] did not own."

Facilitators 1 and 3 realized MSAF was a highly institutionalized, bureaucratic organization and worked hard at encouraging the planning group to be creative to "own" the planning, monitoring, and control of the strategic plan and extensively communicated with employees so that they understood and agreed with the new strategic direction. Facilitator 1 was reasonably successful in achieving these objectives as the strategic plan implementation was "owned" and driven by the management and staff and implemented rapidly. While Facilitator 3 was able to secure commitment of the planning group and management toward the "new" strategy, because approval of the strategic plan was not secured, employees lacked commitment for the implementation of strategic plan. Facilitator 2 chose to unilaterally control the whole strategic planning process.

Facilitator 1 frequently communicated organization-wide to develop strategic consensus by management and staff for strategy development and implementation. While Facilitator 3 frequently communicated with the Board and planning group, little vertical communication to staff was possible as the strategic plan was never approved. In contrast, Facilitator 2 adopted a strict top-down facilitation and communication approach with minimal vertical communication, creating a barrier to communication with management and staff and inhibiting strategy development and implementation. Counterproductive dialogue by management and staff ensued.

Facilitator 1, through extensive strategic planning training and support provided to the planning group and key staff, and with ongoing involvement and communication, was able to develop management and employee commitment to the planning process with congruency of self-interests to organizational interests. Facilitator 2, on the other hand, failed to involve management and employees and, hence, failed to gain their commitment to the planning process, resulting in employee self-interest prevailing and implementation failure. Facilitator 3 established trust and commitment of management to the planning process but not in all employees due to the inability in obtaining approval for the strategic plan.

The MSAF Board and CEO were consistently supportive of the strategic planning process throughout this study. However, three successive strategic planning facilitators were utilized. Facilitator 1 was charismatic with a high degree of interpersonal skills which allowed the facilitator to develop buy-in of the planning team and helped develop a clear strategy that was communicated consistently organization-wide. This approach allayed concerns and aligned employees to the new strategy. Facilitator 2 gained no buy-in of management to the strategic planning process, which was evidenced by inconsistency between management and the facilitator and the inconsistent messages being sent to employees, which destabilized the organization. Facilitator 2 while being technically skilled lacked charisma, interpersonal skills, and empathy for management and employees. Facilitator 3 was charismatic, established rapport with management and staff, and was able to convince the Board and management to commit to and support the new strategy. Since the strategic plan was not approved, inconsistent messages were sent to the management and employees, resulting in their lack of commitment to the implementation of the strategic plan.

MSAF exhibited an institutionalized, bureaucratic, governmental culture which if not managed appropriately could hinder strategic facilitation and implementation. Notwithstanding, Facilitator 1 was unfamiliar with the culture of MSAF, however quickly grasped the nuances of the organization, and was able to work successfully within and with the organization. Facilitator 2 also was unfamiliar with (and made no attempt to understand) the culture of the organization, was viewed as an "outsider," and faced many obstacles and resistance when facilitating the strategic planning process. Facilitator 3 was intimately familiar with the culture of the organization (as CEO, he was part of the culture), and the culture under his guidance encouraged strategy facilitation.

## Conclusion and Research Implications

This study offers a unique perspective on the use of "in-house" and "external" strategic planning facilitators in the public sector and the approaches adopted. Unlike some studies, we argue that management should focus on ensuring that the process results in a simple and implementable strategic plan to drive organizational performance, as opposed to getting lost in the "in-house" versus "external" facilitator debate.

In spite of the best of intentions, applied efforts, strategic planning facilitation, and incurred expense of public enterprises, public enterprises often operate with no strategy, an unapproved strategy or a strategy doomed to fail.

# Public Service and Service Delivery

Afeez Kolawole Shittu
Department of Political Science, Obafemi Awolowo University, Ile Ife, Nigeria
Department of Political Science, Federal College of Education (Special), Oyo, Nigeria

## Synonyms

Civil service; Performance; Public policy; Public sector; Public service delivery

## Definition

| | |
|---|---|
| **Public Service** | Public service means the activities and services done in any government capacity in the interest of the public domain and for the benefit of the general public. Such services include policing, defense, healthcare, education, etc. |
| **Public Sector** | This is a sector owned or at least controlled by the government to provide services to the public. |

**Service Delivery** This refers to the extent to which the services provided by the listed sectors meet or exceed the expectation of the beneficiaries (general public).

## Introduction

The public service in any country of the world represents the machinery of government through which public policies are formulated and implemented. Public service achieves this function by converting government policies and programs into tangible goods and services for the consumption of the citizenry. It is important to note in this entry that there exists an interlocking relationship between public service and service delivery. In other words, the existence of a public policy is desirable, and public service exists to serve the purpose of service delivery. That is to say that the service(s) provided must meet the needs and expectations of the general public. Also worthy of note is the existence of modern government across the globe which has demarcated the operation of government into three main organs irrespective of the government system in operation. The first is the legislature that is saddled with law-making function, the second is the executive with policy formulation and implementation function, and the third is the judiciary that is in charge of law interpretation and enforcement. The overall outcome of the activities of these government machineries is to deliver public goods and services to the welfare and security of the citizens through the instrumentality of public services.

For proper analysis of this entry, it shall be divided into six chapters. Apart from the introductory chapter, the second chapter shall provide a concise overview of the meaning of public service as against civil service as both words were sometimes used interchangeably. The third chapter shall discuss notable characteristics of public service as against private service in addition to the functions of public service. Public service delivery and the model of relationship were discussed in the fourth chapter. The fifth chapter looks at the public service reforms in the context of effective service delivery. The sixth chapter summarizes the synopsis of the whole sub-chapters and makes meaningful conclusions.

## Public Service and Civil Service Defined

The use of the term civil service is not within the jurisdiction of this entry, but I will implore to keep in view as the distinction becomes imperative to clear the interchangeable usage of the concepts as if both are the same. In public administration literature, the term public service has become a contested concept which can best be understood in the way the word is used and practiced in the constitution of the various countries of the world. Despite this, the function and purpose as well as the expectation of public service in terms of service delivery remain the same all over the countries. Drawing from international research evidence, public service varies in terms of management, function, and uses. Spicker (2009) argues that the best way to understand any term is the way it is used and practiced. For instance, the publication of the UK Cabinet Office (2008: 5) did not provide a definition of public service but described public service as services such as education, health, policing, and defense. Public services from a holistic view are those services funded by the money accrued through taxation from the general public and for the benefits of the public. These are organized services responsible for managing and controlling the resources of the state on behalf of the general public who are actually the owners of the resources. These services are run and controlled by either the elected or appointed government offices. The management of these services could be federal, state, or local government depending on the country. At the same time, some services such as health and education which are regarded as public service may sometimes be overtaken by either public, private, or voluntary sectors depending on the country concerned and type of services provided. An example of a voluntary service that is considered public service is the independently provided libraries (such as Carnegie Library) that have been serving the community well for generations in the United States (Southern Education Library Board

2006). In line with the above, government funded projects are sometimes contacted to the private firms for execution and the delivery of such projects still remains in the domain of public service. The delivery of such services still remains a public service criterion. Canadian banks are a notable example of this arrangement (Canadian Parliament 1998).

In relation to the difference that exists between public and civil service, public service is broader in scope and encompasses the service of civil service, while civil service is a subset of public service. Gboyega (2004: 3) describes public service as service in any government capacity such as elected or appointed members of the legislature, executive, judiciary, ministries, boards and statutory corporation, and members of the armed forces at all levels of government. All these ministries, corporations, and parastatals that government controls are regarded as public sectors, and staff and employees working for the provision of services to the citizens are called public servants. Faseluka (2010) buttresses the understanding of public service as the totality of the services directed to the management of human, material, and financial resources of the state for the provision of welfare services to the general public. Further evidence can be drawn from the 1999 Constitution of the Federal Republic of Nigeria (as amended). Specifically, Section 169 of the Constitution makes provision for the existence of the civil service of the federation which states that "There shall be a Civil Service of the Federation." The provision further recognizes the civil service as the administrative machinery for implementing government policies and programs with a view of advancing the welfare and well-being of the citizenry. Civil service according to manual handbook in the Nigerian context also connotes an administrative machinery of the executive arms of the government that are responsible for policy implementations and execution for the service of the citizens. A civil servant in this regard represents an employee working and employed by civil service commission based on his expertise and professionalism.

From the above, a clear distinction can be made from the above description of public and civil service that the latter is the subset of the former being smaller in composition. One of the unique attributes of civil service is its permanence nature as it remains despite the change in government. This is why Warren Fisher in his report of the Royal Commission of the Civil Service (1929) stated as follows:

> Ministers functions as policy determinant, and the moment policy is determined, civil servant has unquestionable responsibility of carrying out the policy in good faith without any fear or favour irrespective of whether he/she agrees with policy or not.

The above submission therefore presupposes the basic functions of the civil service all over the world to include the provision of necessary that could aid the government in the formulation of policy as well as implementing the approved policies of the government to the latter without fear and favor. The civil servant as an employee of the civil service commission is expected to perform these duties without fear or favor and in accordance with the laid down rules and regulations.

## Characteristics of Public Service

Having established the basic understanding of public service from the foregoing chapter, it is also important to look at its basic characteristics in order to clarify its functions from that of the private service. It must be established at this juncture that the rise of capitalism and its emergent concepts such as economic liberalization, privatization, and commercialization of public sector by some private firms appears as if these private organizations are performing the function of public service; notwithstanding, public service has its own distinctive characteristics which are very important in several ways in contrast to private service. On this note, Spicker (2009) identified four distinctive characteristics of public service – reason of public policy, provision of services to the public, function as an agent of redistribution, and operating as a trust.

**Determination of Public Policy:** The government exists to make provisions for the welfare and security of citizens. The government does this

function through policy formulation and implantation. Public policy in this regard represents the action and inaction of the government towards the needs of citizens. It is the totality of government programs and strategies towards responding to the needs of citizens. The provision of security function, welfare services, education, healthcare, roads, water, and sanitations were initially formulated in form of policies and later implemented through government bureaucracy and its agencies. Public policy therefore represents one of the unique attributes of public service through which public policies are implemented in form of service delivery to the members of the general public.

**Provision of Services:** Public service exists to provide the necessary service to the public at low or no cost at all. These services are essential for the survival of the general public such as water, electricity, healthcare service, and general protection of lives and properties. One important factor in this level is the value of service provided for the citizens. This is why value in private service is quite different from that of the public service. The relationship between the service provider and the recipient of the service is very direct in private services. The client has direct access to making private service accountable for the value of service received. The moment clients discover that the value is the service provided does not commensurate to the amount spent, clients stop the patronage. Such accountability in a public service is not possible. Clients do not directly pay for the services provided by the government. Since most of such services are subsidized or sometimes free (education, healthcare, water, voters' identity card, etc.). The service may be free to citizens but not to the government. In fact, the costs of production and delivery of services are costlier to the government. This is why the government is most likely to go into partnership with private service in order to reduce the cost of delivery. Since clients do not pay directly, it is difficult to judge whether the services being provided are worth the money being incurred by the government (out of the tax paid by citizens).

**Consumer Preference:** Public services are not designed to meet the desire and preference of the client but to further the desire of policy makers and whatever they consider as desirable for the general public. Policy makers in this regard may include not only the government but voluntary organizations and philanthropists, among others. In the case of private service, it is the preference of the consumer that determines the production of goods and services (Boyne 2002:98).

**Redistribution:** This is one of the key features of public service. The fact that is not for commercial purpose makes public service perform a redistributive function. Spicker (2009) notes that people that paid might not be the recipient of the services. For instance, a company that sells soup to the public is not providing a public service, but an agency that champions the distributions of such service to the homeless actually does. Redistribution is an inevitable function of public service because the government actually allocates resources to balance the inequality in resource distribution with a view to protecting the poor of the poorest in the society. Public service does this function with the intention of engendering even development in the country between the haves and the haves not. This is a way of providing socio-economic justice to the public. Redistributing function can also be performed by private and charity organizations as well.

**Public Service as Trust:** The needs of the citizens are entrusted in the government that must be provided through public service. It is assumed that people may lack the capacity to make an informed or rational decision themselves, and hence the government must make a decision that is considered good on behalf of its citizens. Some scholars called this a paternalistic role. It is paternalistic because governments make provisions for citizens without prior consent. This is done in order to prevent the consequence and risk that could arise from the freedom of individuals to make irrational choices or decisions.

## Functions of Public Service

In any country of the world, public service performs certain functions that are unique and distinct. The following are some of the functions of public service.

**Provision of Social Services:** Provision of the essential services needed for the survival and sustenance of the general public is one of the basic responsibilities of public service. There are several categories of social services that public sectors provided for. Prominent among these include communication, healthcare services, education services, housing services, transportation services, and many others. All these were made available for public consumption and use.

**Formulation and Implementation of Policies:** For service to be rendered to the public, it must be formulated in policy. Policy is the totality of government plans and strategies towards the citizens. Public service becomes an essential instrumental that translates government programs into reality for the benefit of the citizens. They are also instrumental in providing necessary data and information to the government that could help in policy formulation. Without the instrumentality of public service, government policy remains utopian that cannot be realized.

**Government Continuity:** For democratically elected government, there exist inbuilt mechanisms within the constitution to change the government through the process of election. When this occurs, it is the public servant that ensures the continuity of government in order to bridge the vacuum in government and to prevent the state of anarchy. The sector has the capacity to even sustain the period of military interregnum and revolution against the civil government (Naidu 2005). The overall outcome of the functions of public service as highlighted is to deliver social services to the citizenry.

## Public Service Delivery

Since the formation of civil society where men entered into an agreement on the basis of social contract with the government, the question of service delivery has become so pivotal. The social contract arrangement is the consequences of the envisioned state of nature by Thomas Hobbes in his state of nature without government and opines that the lives of men were brutish, nasty, and short. Hobbes (1994) thus suggests a social contract where men surrendered their rights under the sovereign authority with the ultimate goal of preserving their lives against violent death. As a result, the government is charged with the responsibility of preserving the lives and properties of the citizens against physical or imagined threats. The government therefore shoulders with enormous responsibilities that must be discharged effectively and efficiently. To actualize this enormous task, public service emerged as the main machinery of government. Public service has therefore represented the building bridge for (government) to respond to the needs of the general public (citizens). In other words, public service carries the responsibility of formulating and executing policies and programs with the ultimate goal of delivering important welfare services that are capable of enhancing the standard living of the general public. Since the term "public" according to Jones (1970) refers to the citizens of a particular geography at a particular time, public service evokes the thought of government involvement in service delivery that is devoid of profit motives. Ogunna (2004: 2) reiterates that the desire to satisfy the public through the implementation of public policies, enforcement of laws, and realization of public welfare culminates the effective public service delivery. Public service delivery becomes so paramount because it represents the fundamental structure of nation-building, it serves a tangible link between government and citizens to the government, and it also promotes the values of nations to the citizens and finally serves as a bond between the state and citizens (Walle and Scott 2009). Since effective service delivery remains the overall outcome of public services, measuring the performance to keep them in line of duty is very essential. On this note, Al-Ghazali (2008: 5) identified the following checklist for measuring the capabilities of public service for effective service delivery:

- Public service should be able to demonstrate effective delivery of goods and services at a low cost and timely manner.
- Public service should be able to demonstrate equitable distribution of the services to the people in a fairer and transparent manner.

- Citizens should have the convictions that state institutions and public service respect the fundamental rights of the citizens and themselves demonstrate respect for the laws of the land.
- Public service should be wary of physical force and coercion and the effective use of legitimate power to command submission.
- The environment should secure citizens to carry out their daily routines without fear or hindrance.
- Finally, equal treatment and dispensation of justice for all citizens without any bias.

To this end, the extent to which public service performs to meet the expectation of effective service delivery to citizens varies from country to country. This is why virtually all countries of the world continue to constantly reform their public services with a view to ensuring that the delivery of goods and social services is done in an effective and efficient manner.

## Model of Relationship in Public Service Delivery

The delivery of public services to the general public is a function of the distribution of duties and responsibilities to various bureaucratic organizations. The ability and capacity of bureaucracy to effectively carry out the assigned task depend on the relationship and motivation put in place. There are several models that can be applied to ensuring the proper performance of bureaucracy for effective service delivery. This entry adopts the model in the World Bank report on public service (2018). This model identified five main features for effective service delivery, and these include financing, delegation, performance, information about performance, and enforceability. It therefore identifies four different actors with their distinctive roles in the direction of service delivery. These include citizens or clients, politicians or policy makers, organizational providers, and frontline professionals. Citizens/clients represent the service recipient such as patients, students, traders, pensioners, and many others. With respect to politicians/policy makers, these are the categories of political executives such has ministers, commissioners, and elected public officials that cut across various levels of governments. While organizational providers represent civil servants at the top echelon and possess the power and authority to command on the frontline service providers, the frontline professionals constitute the set of people that perform the actual function of service delivery to the general public such as police officer, medical practitioners, teachers, etc. All these aforementioned actors perform their roles based on the laid down process and procedure of relationships. The whole gamut of relationship cantered on the reciprocal relationship between two actors – one being the principal actor and the other his agent. They were all related in respect of five features of the abovementioned tasks or services. This is demonstrated in Fig. 1.

**Public Service and Service Delivery, Fig. 1** Model of relationship

The illustration of the relationship is as follows: The policy makers make provision to the citizen through its established organization for service providers known as bureaucracy. The policy maker tasked its agencies through the delegation of duties to be performed by the frontline providers with the provision of necessary resources such as infrastructure, fund, training, etc. The service providers carried out the function of performing and reporting information about the task with a view to get an approval by the principal actor to determine whether the task has been carried out effectively. Where cases of improper conduct exist, the principal actor instructed the service providers in form of enforcement to take necessary corrective measures so as to satisfy the service norms. On the other hand, the citizen has the reciprocal relationship of becoming the principal actor having democratically elected their leaders with the mandate in form of delegating to perform the function of the service provider and proving them with resources through tax payment (financing). The executives either elected or appointed serve as machinery for performing the governance function and meet up with the expectations of the citizens. In case of failure in their performance, the citizen has the mandate to express their dissatisfaction by voting them out of power in another election. The interlocking relationship explained in the model is a way of making the political executives accountable and responsive to the needs of the citizens through the delivery of quality services.

## Public Service Reform

As established from the foregoing, the overall goal of public service is the effective service delivery that meets the needs and expectations of the general public in a particular polity. The idea of reform came into public service with the motive of improving the public service delivery for the benefit of the public. For the past few decades, many industrialized nations of the world have rigorously engaged in public service reforms. The ultimate goal of this reform is to ensure that public service has the right people and operates efficiently and effectively for the delivery of the right services and policies to the general public. In other words, improving service delivery remains the pivotal goal of any reform in the public sector. The historical development of reform in public service is exemplified in the threefold framework of Burns et al. (1994) where service providers see clients in the past time as a dependency on the period of recognizing their greater involvement and empowerment as citizens (Fig. 2).

Max Weber's classical model of public service was the order of the day at the beginning of public service across the globe. In this Weberian era, adherence to formal rules, regulations, and bureaucratic rigidity and procedure dominate the delivery of public service. According to Burns et al. (1994), the service delivery at this time was fair and impartial and was often characterized by rigidity and top-down approach to public service. This classical model was influenced by the upsurge of industrial revolutions in the latter part of the nineteenth century in Europe. It therefore emphasizes proper control in the chain of command and embraces meritorious and qualified public servants. At this period, the government was regarded as an instrument of socioeconomic

**Public Service and Service Delivery, Fig. 2** Burns' model of reforms. (Source: Based on Burns et al. 1994)

development and nation-building. However, consequent upon the development of society and emergent complexity in governance with the rise of education, expansion as well as liberal democratic views challenged the status quo of the classical model of public service. This brought about the question of accountability, cost-effectiveness, and the value of money. This gave rise to a new public management approach (Pollitt 1995) that was largely dominated by the capitalist economy that promotes profit-oriented private companies. The attitude of this new management school includes cutting down to size, reduction bureaucracy, privatization and commercialization of public enterprises, deregulation, lower taxes, and public-private partnerships (Faseluka 2010). All these were strengthened by demands for democratic consolidation, transparency, accountability, and performance from the public sector. While some author (Yayale 2007: 5–6) argues against the excessive privatization of government-owned sectors, the reality of the twenty-first century attested to the need for a professional, committed, knowledgeable, and well-remunerated public service in order to deliver goods and services to the generality of the people. The initiation of reform in the public sector could be emanated at any level of government such as federal, state, or local government depending on the country's focus. To this end various reforms have been instituted on structure and personnel management at various country levels aimed at ensuring effective and efficient service delivery to her citizens.

## Conclusion

This entry did a holistic view of public service and service delivery. The quintessential features and functions that separate public service from that of private services were highlighted. The entry established the nexus between public service and service delivery using the model of relationship. Reforms in public service were also discussed in order to bring out efficiency and effective service delivery to the general public. There is no doubt that public service has come to represent an inevitable instrument for the delivery of social services to the general public across the globe irrespective of the system of government in operation. Consequent to the above, this entry concludes that there is a need for regular review of public service performance in order to improve efficient and effective service delivery to the general public.

# Public Service Commission Capacity and Performance Management in Ghana

Bernard Gumah[1] and Edward Brenya[2]
[1]School of Management and Economics, University of Electronic Science and technology of China, Chengdu, China
[2]Department of Political Studies, KNUST, Kumasi, Ghana

## Synonyms

Competence; Efficiency; Effectiveness; Personnel management; Public personnel management; Public personnel managers; Public organizations; Resources

## Definitions

Organizational Capacity is the human and non-human resources required to effectively identify problems, develop programs, and evaluate such programs for it to succeed.

Performance Management is the deliberate action taken by organizations to bring about efficiency and effectiveness in the delivery of services for the public good.

## Introduction

Public sector Performance Management Systems (PM(S)) are designed deliberately by governments to improve the conduct of government business through the effective and efficient delivery of services. In Ghana, this is the function of the Public Services Commission (PSC), the human resource division of government responsible for providing the framework for the institutionalization of the PMS in the public services. The development of PMS for Public Sector Organizations (PSO) in Ghana begun in the 1980s. However, no plan has been sustainable due to the numerous challenges that confront the implementation stage. The Civil Service Performance Improvement Programme and the Performance Evaluation System are among the recent attempts to institutionalize PM in PSOs.

In principle, the use of "corporate parent" in large organizations can enhance the performance of subsidiary organizations through economies of scale and the ability to augment the level of expertise. Performance can be enhanced by corporate parents through three main ways, ensuring that legal requirements are observed, appointing persons to managerial positions and acquiring the necessary resources to run the organization. Secondly, providing services that support front-line functions, such as HR, purchasing, IT, and finance. Lastly, corporate parents stimulate and enrich unit performance by checking targets, reviewing plans, allocating resources, and monitoring performance (Goold and Campbell 2002).

Limited studies are attempting to study the role of organizations that design policy and how such organization play a role in the implementation of policies they design. The scenario is not different in Ghana. This entry aims to assess the capacity and the effectiveness of central government agencies in implementing PM. It also examines factors such as leadership commitment and how it influences the implementation of policies. The entry is motivated by the literature on organizational capacity which posits that capacity is vital in the execution of policies and programs. Policies are noted to be dysfunctional in low-capacity organizations.

## Organizational Capacity

Theories of public management assert that capacity is a critical determinant of service quality and a critical component for achieving improved service delivery. The availability of nonhuman resources in the absence of human resources is meaningless. Often, organizational capacity encompasses leadership, collaborative ability, and technological capabilities which are used to manage systemic challenges. The availability of resources, infrastructure, and technology has no consequences without an efficient, effective, and knowledgeable workforce. This is particularly so in PSOs where the provision of public goods and services takes place within an environment of scarce resources and competing demands. It is the expectation that in implementing public policy, these factors should be considered to ensure implementation is not affected by one or more of such factors.

There is a direct relation between the level of management capacity and performance. Governments and organizations with high-capacity most often manage resources well and have active policies and programs, which allows them to be adaptable, effective, and efficient, while those with low capacity struggle to develop, innovate, implement and will be deficient in their desire for self-improvement. Proponents of integrative leadership argue that the exhibition of effective leadership through actions that build and improve organizational abilities and management systems is the mode by which leaders of organizations create and direct their organizational capacity (Moynihan and Ingraham 2004).

## Public Policy Implementation

Public policy is a deliberate action taken by governmental bodies and officials' in dealing with a public problem and is dependent on local capacity and will to succeed (Giacchino and Kakabadse 2003). The striking character about the definitions of public policy is its purposiveness and its relationship to problems of society. Agenda setting, policy formulation and legitimation, implementation and evaluation are stages in the policy process (Sabatier 2007) and that "policy is made as it is being administered and administered as it is being made" (p. 79).

Implementation is the operationalization of a policy or program. Stewart et al. (2007) state that implementation is the process in which actors, institutions, procedures, and techniques work together in the pursuit of policy goals or programs. It is important for the definition of implementation to include the effects of internal and external factors of the implementing institution. In the implementation process, the following are usually present information dissemination, policy adoption, initial implementation, and sustainability. An understanding of these aspects of implementation is necessary because each stage necessitates different approaches from actors.

Although variations exist in the components of implementation, there are common themes. First, only new programs are implemented. Secondly, there is information-sharing between knowledgeable actors and those who know little about it. Furthermore, the context within which the implementation process occurs is taken into account, and finally, there is an organization or individual actively involved in initiating a program, known as a change agent (Forman et al. 2013). For a Performance Management Policy (PMP) to succeed most of these components should exist. The PMP is a new program used to manage the performance of PSOs, through the PSC, to solve the problem of inefficiency and productivity. The role of the PSC in allocating roles to stakeholders as well as ensuring the success of the implementation process is critical. It is required to share information with other public sector organizations while being conscious of the dynamics of implementers.

The following are found to be critical in implementation: communication, resources, dispositions or attitudes, and bureaucratic structure. Implementation can also be affected by personal implementer factors (skills, attitudes, and beliefs), organizational context (organizational procedures and policies), and the external environment of implementers (Fixsen et al. 2005). Durlak

and DuPre (2008) add contextual fit and organizational capacity. Three approaches to implementation are identified; top-down, bottom-up, and the mixed or hybrid theories of policy implementation (DeLeon and DeLeon 2002). The implementation of PM follows a mixed approach. The mixed or hybrid theory blends several components of other theories in addition to the top-down and the bottom-up perspective. The approach of this theory is a combination of central steering and local autonomy.

## The Case of Ghana

In designing the PMP, consideration was given to factors that derailed previous efforts. Since stakeholder participation answers the subtle question of program ownership, it is also supposed to whip up stakeholder interest. Program ownership allays fears by public servants and the general public of an externally imposed policy, while a government-wide approach solves the problem of policy implementation fragmentation (Ohemeng 2011). According to the PSC, the following were the main actors in the formulation and design of the PMP: civil society groups, government representatives, labor experts, labor groups, and public sector organizations. Civil society groups which comprise the media, community-based organizations, and pressure groups were instrumental in bringing to the attention of government the inefficiencies of PSOs.

The policy design began in 2007 but truncated due to a change of government in 2008 and finally implemented in 2015. This is indicative of the adverse effects of the politicization of public policies. The technocratic competence of the staff of the PSC and their ability to mobilize stakeholders played an essential role in the formulation of the PMP. Mostly, policy lapses are only noticed during implementation, and the successful management of these policy deficiencies will determine whether the policy is implementable or not. The abandonment of policies in the past was due to fundamental errors that were not immediately identifiable during the formulation stage, a reason why piloting is essential. When a hybrid approach is adopted, the policy cannot be evaluated only at the formulation stage.

The design of an implementation strategy should be specific to an objective. Therefore a one-size fits all approach is not recommended (Pulakos 2009). A PMS that seeks to achieve several objectives are likely to whither for its lack of focus and weight. The expectation is that the PM strategy for decision-making should differ from the strategy for individual and organizational development. Therefore, the use of a single strategy to achieve several results is likely to be riddled with challenges. It is, therefore, not a surprise that it has become impossible to link promotion and pay with performance.

The study is concerned with the individual levels of PM. This level involves every public servant. Ministers and Board of Governors (BoG) set targets for each organization and they sign performance contracts with Chief Executive Officers (CEO). Managerial level staff in turn sign performance contracts with the CEO or Chief Director (CD), while line managers and heads of departments carry out performance appraisals with the rest of the staff. Signing performance contracts do not guarantee the success of PM in any organization. Staffs of public organizations participate in PM through appraisals which comprise planning performance, reviewing, and evaluating performance targets. Promotions are said to be dependent upon a 3 year continuous performance appraisal of each staff. Staff members are required to insist on appraisals if they are not being carried out in the organization.

As stated by Durlak and DuPre (2008), implementation passes through stages, one of which is an initial implementation. Piloting is an essential stage that provides implementers and change agents with the opportunity for initial evaluation of the strengths and weaknesses of a policy before roll out. It is the legislative process that gives legal backing to every policy, making it acceptable and within the confirms of the legal system of the country. Getting budgetary support for a policy is vital especially in Ghana where PSOs are not adequately funded to carry out their responsibilities. It becomes exceptionally challenging if not impossible to measure performance when

there are no resources to carry out objectives. The expectation is that the PSC would follow these requirements to implement an effective program.

From the perspective of the PSC, they have the required capacity to implement PM in the public services. They believe they have the required legal backing, human resource, policy acceptance, and committed leadership which are all necessary for effective implementation. Other agencies have a similar mandate, but the PSC has a superior mandate through the Constitution and the PSC Act 486, 1994. Ting (2011) notes that organizational capacity provides agencies with a technological advantage over the principal, such as a legislature or executive. The ability to make such investments may arise through purchasing or hiring or explicit delegation. The implementing agency determines the kinds of expertise, personnel, and data that can be brought to bear on specific policies. A government that cares about implementation would take these issues into account in future policy choices. Even though the PSC states that they have the required capacity to implement PM, this is doubtful.

The legislation that sets up the PSC provides that Parliament appropriate, such monies it finds necessary for the expenditure of the commission. There is the political backing of governments in principle. Government support includes ensuring the provision of finances to enable it to execute its functions. One of the considerations in the formulation and design of policy is funding, which is necessary for a successful implementation. The financial capacity of the PSC to engage additional personnel, external support, and to develop innovative solutions, especially in technology, is critical for a smooth implementation. Sadly, the 2015 PSC annual report laments of late and inadequate budgetary allocation which is a significant hindrance to performance, which affects the implementation of their programs and impacts on monitoring and enforcement.

If the PSC cannot monitor and enforce compliance but relays on organizations' internal mechanisms, implementation will not be successful especially if the head of that organization is not committed. The principle of performance governance and performance leadership within organizations is vital for implementation. The PSC is required to periodically conduct an audit of organizational performance management practices to ascertain compliance by the PSOs (Parliament of Ghana 2010). Monitoring and enforcement require adequate workforce, but the insufficient and skeletal staff at the PSC cannot support monitoring activities as indicated in the PSC's 2015 annual report. Even though it is said that the PSC is not directly involved with implementation, it still needs an adequate workforce for the various duties the commission and its secretariat are supposed to carry out. In the 2015 annual report, the observation was that only 50 out of about 130 PSOs had implemented PM. The report is nonetheless silent on sanctions for heads of organizations who have not implemented the system. The commission received 16 requests for training in 2015, only 11 organizations received training from 15 training sessions (The Public Services Commission 2016). In such situations, technology will be useful as well as utilizing consultants and experts from nongovernmental organizations as well as training institutions like the Ghana Institute of Public Administration and the University of Ghana.

In verifying the implementation of the PM within PSOs as indicated by the PSC, out of 71 public sector workers surveyed, 11.3% disagreed that they have participated in appraisals, in their organizations. In the appraisal of staff, 28.2% have not participated in planning their performance, 32.4% have not taken part in performance reviews, and 34.0% have not taken part in evaluating their performance with their immediate supervisors. This finding cannot support the PSC's assertion that the PMS is participatory. Inadequate training of PSOs in addition to a lack of monitoring of the implementation process explains this trend. Based on this, the implementation of PM in PSO cannot be said to be successful pointing to the need for the PSC to reassess its strategies.

Just like previous PMS, the PSC still identifies similar challenges with the implementation of the policy. Some of these challenges are recurring because they are too grounded in the

sociopolitical system of the country hence doubtful they can be avoided. It is evident that competence and the size of an agency's staff, the degree of hierarchical control of subunit decisions, and processes within the implementing agencies are problems that may affect the capacity of an organization to implement. Resource deficiency, especially in third world countries, has been a reason for the failure of several policies (Grindle 2017). Lack of appropriate enforcement mechanisms and monitoring activities also affect implementation.

It is clear that subunits have a greater responsibility in implementation than the central government agencies. With determined leadership, the poorly formulated policy can be redesigned and tailored to suit the condition of each PSO; also committed heads of PSOs will provide the feedback necessary to amend poorly formulated policies. This supports one of Andrews and Boyne (2010) conclusion that the impact of capacity is enhanced through leadership. Leadership is significant in policy development and policy implementation and particularly vital to the subunits rather than to the central agency at the implementation stage.

## Conclusion

The entry described the implementation of PM through an evaluation of the capacity of the Public Services Commission. After providing background and theoretical underpinning of the paper, the entry shows that a central government agency such as the PSC has a role to play in the implementation of policies and that the level of capacity plays an influential role in the success or otherwise of a policy. Also, leadership enhances organizational capacity and works as a catalyst in implementation. The two factors are not mutually exclusive. It is, therefore, appropriate to conclude that the PSC has a limited role to play in the implementation of PM because of its limited human and financial capacity. For this reason, a reevaluation of the capacity needs of not only the PSC but all PSOs will enhance policy implementation.

Bureaucratic responsiveness; Ethical compliance; Ethical environment; Institutional reforms; Institutionalizing ethics in public administration; Public service; Social accountability

## Definitions

**Public service**: entails the provision of essential public services via implementation of government programs and policies through the principles of professionalism, ethics, accountability, transparency, and responsibility.

**Ethics**: is a form of self-accountability, an "inner check" on the conduct, behavior, or action of public administrators and other officials of public service (Farazmand 2002, p. 138).

**Accountability**: therefore means that the administration has to be accountable for the exercise of authority which it possesses (Sharma et al. 2012, p. 954).

## Introduction

In recent times, the issue of ethics and accountability has been of great interest to scholars, human resources (HRs) practitioners, and the governments especially in this era of globalization and sustainability. This is because, citizens are no longer tolerant of abuses of public trust and of the malfeasance of the past; they expect accountability and transparency (Brinkerhoff 2000, p. 239). Accountability presents challenges of its own including measurement, compliance, and enforcement (Corbett 2017, p. 2). As Farazmand (2002) points out, "ethics and accountability transcend virtually all human and institutional boundaries at local, national, and international levels" (p. 127). Lack of accountability, unethical behavior, and corrupt practices have become so pervasive, and even institutionalized norms of behavior in Africa to the extent that one may conveniently speak of a crisis of ethics in African public services (Rashed 1995, p. 1). Notably, since public service has always been valued as a major feature of human civilization, restoration of public service image is an imperative that needs to be recognized by all citizens, policy actors, governing political elites, and administrative elites across the globe (Farazmand 2002, p. 127). Importantly, due to "the centrality of administration in politics and the power structure, ethically sound professional public administrators can be viewed as effective 'guardians of public trust' and broadly based public interest around the world" (Farazmand 2002, p. 139). This no doubt has implications for the promotion of sound ethical climate and accountability structure in Nigeria public sector organizations and the attainment of sustainable development goals (SDGs 16) targets namely: To significantly reduce illicit financial and arms flows, strengthen the recovery and return of stolen assets and combat all forms of organized crime (16.4) targets; to substantially

reduce corruption and bribery in all their forms (16.5) targets; and to develop effective, accountable and transparent institutions at all levels (16.6) targets; especially in Nigeria and other developing countries by 2030 (see: UN General Assembly 2015, p. 25).

Thus, the Nigerian public service expects a sound political and administrative system that is driven by virtues of discipline, integrity, dignity of labor, social justice, impartiality, transparency, accountability, and equity where extant rules and established regulations guide official conduct (Ukeje et al. 2019). It is presupposed that the acquisition of these virtues will improve our ethical practices and standards. Sensitivity to the public interest is the most fundamental ethical obligation of the public official (Stahl 2009). According to Idike et al. (2019, p. 7), "The Nigerian bureaucracy had been conservative, neglecting the most critical elements of citizen-government collaboration and cooperation, and people-driven governance; regional representation in the public service is without citizen participation in the policy choice and, under such conditions, the general interest becomes the last resort." No doubt, public services in Nigeria over the years have received the highest level of negative societal criticisms in spite of varied ethical codes and reforms in the bureaucracy (Ukeje et al. 2019). This agrees with the position of Atkinson (2016), that public employees are themselves driven by personal values that speak to duty and obligation to service. However, these ethical codes notwithstanding many ills still continue to plaque Nigerian society. Cases of unethical practices still persists (Obicci 2016; Ojo 2019). Thus, in a bid to have an ethically upright and accountable public service system, some efforts made by both past and present Nigerian governments to enforce ethical behavior in Nigerian public administration include: the establishment of Economic and Financial Crimes Commission (EFCC), the Code of Conduct Tribunal, the Public Complaints Commission, the Independent Corrupt Practices and other Related Offences Commission (ICPC), and the Budget Monitoring and Price Intelligence Unit (Due Process Office). Similarly, in his New Year message to Nigerians, President Muhammadu Buhari reemphasized his government's commitment to fighting corruption stating thus:

> Our policies are working and the results will continue to show themselves more clearly by the day. . .investors can be certain of our unshakeable commitment to tackle corruption. . .it is important to call out those who find the rule of law an inconvenience or independent regulation an irritation.

While the above merely emphasizes government's goodwill to combating corruption, but none of these will happen without a robust governance structure (Momen and Begum 2020, p. 1). According to Farazmand (2016, p. 7) "Democratic administration demands multiple institutionalised mechanisms to achieve accountability, however imperfect they may be." However, "a sound public administration can guard the public trust against political abuses, corruption and destabilizing political crises and upheavals" (Farazmand 2002, p. 138). From the bureau-pathology of public service ethics reforms in Nigeria, we see the progression of reforms on public service accountability mechanisms in Nigeria public service from the establishment of Public Complaints Commission (PCC), Code of Conduct Bureau (CCB), EFCC, ICPC, to Service Compact (SERVICOM); the present Treasury Single Account (TSA) and the Integrated Personnel and Payroll Information System (IPPIS), all of which have been trapped in the web of bureau-pathology of service reforms in Nigeria.

It is interesting that in spite of all these control measures put in place to ensure a sound ethical climate in Nigeria bureaucracy, the public service ethics (PSEs) has been abandoned and acts of corruption have become the rule rather than the exception. For example, the IPPIS, which was established in 2006 to provide a reliable and comprehensive database for the public service to facilitate manpower planning, eliminate record and payroll fraud, facilitate easy storage, update and retrieve personnel records for administrative purposes, and facilitate convenient staff pension payments with minimal waste and leakages. However, several labor unions in Nigeria have been in conflict with the federal government over its implementation. For example, ASSU recently criticized IPPIS as inefficient in attaining its averred objective to eliminate record and

payroll fraud and establish a reliable and comprehensive database for the Public Service in all the MDAs. Their contention was later justified by several reports from Leadership Newspaper and Office of Auditor General of Nigeria to the effect that IPPIS has been messed up without the government realizing it thereby raising questions of public sector accountability by public officials and the weakness of institutional measures in handling unethical practices in Nigeria governance. The future of public administration rests on these mechanisms if legitimacy is to be achieved, through collaborative efforts between the citizens and administrators (Henson 2016). For instance, so far, no account has been rendered to Nigerians on how the recovered proceeds of corruption are being managed. In fact, there are allegations that the money recovered has been re-looted. This is more so when Transparency International (TI) has ranked Nigeria among world's most corrupt countries moving four places from 148 out of 180 in 2017 to 144 out of 180 in 2018 (Olokor, *The Punch*, 2019). The ranking also reveals that Nigeria has moved 12 places, from 136 in 2015 to the present status. Ojo (2016, p. 13) listed 18 cases of alleged corruption which were never prosecuted. Additionally, there have been cases of corruption involving high profile officers under Buhari's government presently being ignored by anti-graft agencies. Even now, some Nigerians are beginning to express reservations about the government's sincerity in the fight against corruption with many describing it as "good, but not working." Of interest too is that Meyers and Clark (2018) have identified problems relating to enforcement failures due to institutionalized corruption in Sub-Saharan Africa. This led credence to an earlier study in Ukeje et al. (2020a) on their concept of "bio-politics" and "geo-politics" determinants of who should be engaged in public service delivery following "kinship" (communal) and "geographical" political affiliations and their attendant negative effects and consequences in public service delivery. As a point of departure, this entry argues for the institutionalization of a citizen-centered Ethical Compliance Service Charter (ECSC), as part of the much bigger NPM agenda aimed at enhancing the quality of public service delivery and the attainment of social accountability framework in the entire governance framework. To expand on this thought, the entry, attempted to highlight the relationships among the four important dimensions in the debate on bureaucratic ethics which have been understudied in Nigeria:

1. Environment of PS – informal structure (culture, norms, social and spiritual values, citizenship demands and idiosyncrasies, politics and stability, etc.)
2. Bureaucratic leadership – vision, degree of authority for autonomous action, motivation/incentives, capabilities, etc.
3. Bureaucratic edifices – structures, functions, interaction, etc.
4. Output dimension – service delivery (efficiency, effectiveness, accountability, transparency, responsiveness, etc. and public trust)

## Public Service Environment and Levels of Ethical Compliance

According to Ukeje et al. (2019), public service environment constitutes the entire spaces within which the business of bureaucracy is carried on especially in policy implementation. It ranges from the physical/structural to the ideological/normative dimensions. While the former should include all the material aspects of bureaucratic activity, the latter encompasses nonmaterial/values aspect of bureaucracy. Both aspects of course have received considerable attention from researchers and practitioners in a bid to democratizing the former and strengthening the latter. In Nigeria, however, there seems to be a persistence of vertical integration characteristic of most Westminster systems in developing countries. It remains arguable, however, that such vertical integration effort is critical in aligning work and government's priorities in the workplace. For example, an opinion has argued that increased controls: laws, order, and exercise of authority, may not necessarily align organizational/government and individual priorities, especially when isomorphic pressures are factored into causalities

for wicked organizational problems emanating from the notion of legitimacy which appeals as a matter of necessity to external institutionalized practices operating at the symbolic and ceremonial levels (Carey et al. 2017). It is contestable, how resiliently a public servant could retain his sense of calling when faced with unabated isomorphic pressures and equally insensitive organizational policy unsympathetic to his challenges like poor remuneration and unfair reward system; hence, the focal shift to New Institutionalism paradigm (Carey et al. 2017).

Recently, President Buhari directed office of the Accountant-General of Nigeria to open up platform for daily reporting of government financial transactions to the public. However, just like most other similar transparency initiatives, it remains a paper tiger. PSEC enhancement measures therefore may need to go beyond formal organizational strictures to establishing robust state/citizens contact. This agrees with the position of Galera (2016, p. 9) that service charter is an important tool in improving the quality of public service. He further stressed the importance of sustainability and culture-compatibility by outlining ten useful guidelines for designing such citizens-government functional interface so as to avoid the implementation challenges observed in the cases of South Africa and India, where the policy failed due to "lack of customization" to suit context.

## Legitimizing Informal Behavior in Ebonyi State Public Service (EBSPS) System

As mentioned above, certain practices that suffocate ethical climate in public organizations have been interpreted as *table manner*, a "hush up" way of keeping people from speaking up against observed misconducts among public office holders by [figuratively] "stuffing their mouths with 'benefits': bribes, kickbacks, etc.," thereby making them complicit in the error and so become unwilling to expose observed misconducts. It has as corollary the phenomenon called *Son of the soil* syndrome, a sort of autochthonous behavior among bureaucrats. Although the phenomenon is not a novel discovery in Nigeria public administration, the gab it has taken, indeed, its redefinition is new; which indicates a prospect for legitimization of what before now has been seen as unethical behavior in the conduct of public life. In a recent study on the state of Nigeria public service, Ukeje et al. (2019, p. 2) assert that "the Nigeria public service till date, has not been isolated from pervasive bureaucratic quagmire, public disservice, overriding political impunity, rentierism, cronyism, and incongruent poor gross domestic products inherent in government businesses."

> Sadly, corruption in Nigerian democratic system is not just the preserve of politicians and the high and mighty; rather it has become part of the country's constitution not written down. . ..In Nigeria, corruption has taught people that it is dangerous to be honest. If you claimed to be good/honest as a public officer, there is possibility of becoming an endangered public officer (Adetiba 2018, p.4).

This necessitates the introduction of "multi-stakeholder accountability framework that will serve as a platform for future network governance" (Simon 2017) as bulwarks against such legitimization. It remains how public administrators in Ebonyi State can move beyond the present closed system to a more open and adroit system which factors in the citizens sector as important stakeholders in the process of entrenching service quality (Agus et al. 2007). It also benefits from some theoretical insights on the practicability of a place-based "systems leadership" initiatives and development that have the potential to generate public value in cross-sector partnerships for increased accountability and in addressing "wicked" challenges (Bolden et al. 2019). Previous study on leadership effectiveness in Nigeria public sector governance and institutional management in Ukeje (2011) carried out in Ebonyi State University identified and implicated inadequate manpower development as a major challenge to the provision of quality services, capacity building, research, and community development services in the institution. On the other hand, basic factors influencing leadership and institutional performance were identified to include, "external politics, nepotism and political cleavages" (Ndukwe et al. 2015). The study

further argued that institutional leadership outcome is a function of participatory engagements, skill and experience. The motivation for this line of argument questions the place of the policy drivers who are the major implementers of policy intervention programs since effectiveness of citizens-centered leadership approach in solving societal problems is predicated on tribe (ethnic consciousness), religion, sex, and interest sharing in the bureaucracy (Ukeje et al. 2015). This gives an insight into the findings of Okpata and Ukeje (2011) on bureaucratic communication and organizational management that poor HRs planning is a major cause of policy insecurity in administrative performance. The study further discovered that the young graduates and new entrants (employees) in public service find routine tasks of practical administration new on assumption of office despite their areas of specialization and argued that those who carry out public policy or its implementation need to be thoroughly educated on administrative communication procedures and principles that make for effective organizational management. However, bureaucratic-deployment of policy drivers (employees) outside their place of origin strains their ability and capacity to influence policy performance and outcomes effectively (Ukeje et al. 2020b).

Still on poor HRs management, Okechukwu et al. (2016) in another study on the performance of SERVICOM policy in Nigerian democratic governance, identified the practice of "...who sent you syndrome; complimentary card paradox or deification madness," as the reasons for bureaucratic policy failures and poor performance of public services in the public bureaucracy. This explains the reason for the failure of various political and administrative reforms in Nigerian governance (Offu et al. 2018; Ukeje et al. 2020a).

## Structural Innovation in Continuous Role-Playing in PS

As societies evolve, it is necessary for alterations to be made on the administrative structures to reflect the constant game-changing flux in which societies find themselves. According to Ukeje et al. (2019), the extent to which service delivery conforms to ethical standards depends on the environment within which bureaucratic functions are carried out. This position implies partly that unless public service system becomes sensitive to the constant changes and demands from the informal realm of society and reinvents itself to respond to the challenges, it may find itself fighting the same people it is created to serve in the first place. Similarly, it has been argued that attitudinal change would result from better work environment which is able to overcome *demands of diversity* to entrench best practices (Ukeje et al. 2020a, p. 5) and as is also shown in the work above, unethical behaviors among politicians and top-level bureaucrats are somewhat persuaded in the search for equity and legitimacy. This clearly orchestrates dilemmas and institutional weaknesses that just are difficult to resolve and also strengthens motivation for state capture as strategic logic and tool for survival, thus extending the logic for organizational efficiency beyond the stressed importance of organizational structure, job experience, and educational background (Egeberg and Stigen 2018). However, to the best of our knowledge, no research has shown how the product-attitudinal change could reinforce ethical codes as instruments for behavior moderation in public organizations, hence, a citizen-centered ECSC, in a broader sense, extending the scope of ethical reforms beyond the formal bureaucratic institutions through a force of law that establishes citizen-state relations.

## Outputs, Perceptions, and Public Trust: Quest for New Legitimate Action

Here, we expand on the table manner phenomenon which encompasses the variables listed as notable characteristics of the Nigerian bureaucracy (age falsification, attendance/time book manipulation, bribe taking, kick-backs, etc.). Moreso, the introduction of federal character principle (FCP), has complicated the situation, though in Nigerian public sector organizations. According to Azelama and Agbebaku,

"administration of Gowon was enmeshed in corruption, nepotism, favoritism, and insecurity and gradually becoming ineffective. . .." (as cited in Ijewereme 2018, p. 5). In 1975, the same year FCP was introduced, "about 11, 000 bureaucrats were summarily dismissed on grounds of corruption, divided loyalty, declining productivity, without the benefit of defending themselves... the purge led to the dismissal of the good civil servants with the bad" (Ijewereme 2018). Since public bureaucracy is very vital for the development of any society of this modern era, policies that have the tendency of affecting it should be made with much consultation with bureaucrats. Our findings show a unique relationship that exists between informal and formal value structures in Nigeria and further demonstrates the process of formalizing the informal as rules-determining forces (Powell and DiMaggio 1991; Carey et al. 2017). As Carey et al. (2017) argue, "practices emerge from cultural expectations driven by inter- and intra-organizational factors." Thus, it is important to identify those elements that breed wicked problems and novel ways of responding to them.

For example, how best may public sector managers respond to the table manner phenomenon in Nigerian public service? Is it by greater bureaucratization and professionalization couched on greater oversight and consequentialism? Or by evolving a new approach to professionalization based more on individual self-transformation structures buoyed by broader collectivism ranging beyond public organizations boundaries but not outside of it jurisdiction. For example, the Nigerian bureaucracy shows non-responsiveness to contemporary public service paradigms; for literature on reforms in it so far indicate heavy emphasis on vertical integration in response to contemporary organizational challenges, insisting on the Westminster character which primarily imposes new controls as mitigations to unethical behaviors among public officers. Take the IPPIS and the Treasury Single Account (TSA) Reforms for example. Despite the laudable achievements of these twin financial accountability reforms in Nigeria, the spate of financial corruption among politicians and among the top brass of lucrative sectors have continued to make nonsense of those reforms. Because if they are as effective as commonly believed, how do huge amounts of public money manage to leave the public coffers to only require "whistle-blowing" to recover?

Thus, the conceptualization of ethics encompasses the entire terrain of human endeavor; formal as well as informal and in the leadership and followership realms of society (Farazmand 2002). What is very remarkable is that "humans are not angels"; hence the need for moral suasion especially in cooperative interactions in society. Ethics as "a set of norms drawn from values and used to address moral questions" (Bibus III and Carlsen 2016). It has also been defined as "a form of self-discipline, an inner check on the conduct of public servants, and it must be internalized to appear in ethical behavior" (Farazmand 2009, p. 310). As Farazmand (2009) further contended, there are external mechanisms of ethical control of administration – ethics code, institutional reports and requirements, etc. – that if observed can work effectively against unethical conducts. Even though the boundaries of ethics have continued to expand from the early primitive phase of state evolution, the extent of its strengths in moderating cooperative behavior has continued to be a subject of intense debate among scholars and practitioners (see, for example, Lawton and Doig 2006). According to Belle and Cantarelli (2017), unethical behavior is caused by social influences, greed, and egocentrism. In Nigeria, however, unethical behavior is attributed to: self-interest, self-protection, self-deception, self-righteousness, nepotism, indiscipline, and prejudices (Gundu 2011). The general notion, however, is that unethical behavior, be it in the corporate or individual level, emanate from certain discretional dispositions which forces one to act against established rules for arriving at a specified end. The source of this disposition generally called inertia has included the realm beyond formal organizations.

## Mitigating Unethical Behavior/Building Trust

Providing insight into possible solutions for unethical behaviors in the workplace is not an easy task. However, notable suggestions include

monitoring, institution of moral reminders, sensitization programs, *ethical leadership*, administrative accountability, and enforcement of laws (Belle and Cantarelli 2017; Gundu 2011); since ethics is strongly linked to accountability, Farazmand (2016) and employee engagement connected to leader/employee trust relationships built on both "formal and informal norms; a multi-facetted approach that will enhance employee performance" (Ohemeng et al. 2019, p.). What is obviously lacking in the above suggested solutions is the role of the citizens in promoting ethical soundness in public organizations. As Carey et al. (2017) suggested, "Informal institutional practices can circumvent problems with formal structures – making them highly productive for achieving policy goal." Though this is true, how to interface such informal structures with formal processes is not sufficiently demonstrated. So, we provide a supplementary thought based on significant citizens contribution to ethical sound governance; whereas introducing soundness in ethical governance system in EBSPS in particular and Nigeria in general should imply significant increase in the stakes and influence of the informal sector in administering PSEs under the model being proposed; a sort New Collectivism for greater accountability by opening up the "siloed" systems of Old Public Administration (OPA) for a broad-ranging interaction which reflects current trust-building theoretical paradigms in contemporary public administration. As Kettl (2018) noted, trust is a complex phenomenon without a single global trend and which takes time to build. He contended that distrust is not necessarily bad since it restrains governments from abusing state power. Caution is, however, given in ensuring that a healthy distrust does not metastasize into crippling distrust that breeds dysfunction (pg. 440). To rebuild declining public trust therefore, managers of public organizations need to go beyond claims of accountability to engendering transparency by strengthening and utilizing social accountability resources as instrument for (a) increasing the effectiveness of service delivery, (b) improving the quality of governance and democracy, and (c) increasing citizens empowerment (Brinkerhoff and Wetterberg 2015), since citizens play a very important role (Ricci 2016, p. 2).

## State Capture and PSEs in Developing Countries: The Ebonyi State Experience

The desirability of establishing an ethical service charter in the study area is accentuated by the phenomenon of state capture first highlighted by Hellman et al. (2000) to represent domineering influence of political elites on governance systems. In the 2019 special issue of International Journal of Public Administration, Bhuiyan and Farazmand in their study of Middle East and North Africa bureaucracies found that the public policy-making process in the region are biased in favor of the elites (Bhuiyan and Farazmand 2019). Studies on state capture in contemporary public administration, however, show that their discovery is not an isolated regional case since traces of this "octopus" could be found in the public policy processes of other regions (see Ukeje et al. 2019; Idike et al. 2019 for information on Nigeria's case). Other recent case is the "Gupta Affair" in South Africa under former President, Jacob Zuma. Indeed, as Abbo and Kura (2018) and Ukeje et al. (2019) rightly observed, the performances of public organizations in Nigeria defies theoretical association with either homegrown or externally borrowed reform strategies. The PSR processes neither overtly reflect the philosophies of New Public Management (NPM) nor that of New Public Service (NPS), preferring instead a contingency problem-solving approach to PSD, arguably as a result of politicization of public policies by political forces in the endless jostle for political relevance. At the slightest opportunity at policy-making authority, the opposing forces begin, for simple reason of political correctness, a program of undoing what it considers "evils" of the past administration. In most cases in Nigeria, such endeavor fails objective test of relevance. This naturally predisposes public sector organizations to procedural and philosophical (including ethical) crises arising from the over-politicized public policy process which is pointer to state capture (Manning 2001). Establishing a citizen-centered ECSC therefore could provide a fundamental rule process for bypassing entrenched "captures" to an intra- and inter-structural mix-function mechanism for promoting ethical compliance in public

sector organizations; since as further observed, from other scholarly works, "important segments of the society, paradoxically instigated by politicians, have lost belief in the agency of the state as initiator and conductor of change for the better." The reason is not farfetched. Due to long history of misrule by politicians, citizens no longer trust the state as an "objective force on the side of the people" and so clamor for participation in governance. It becomes sacrosanct then to coproduce because in the current state of things, politicians can no longer be entrusted with the responsibility of creating the *public value* needs not be overemphasized. However, it is as much dangerous to begin a journey into *statelessness,* a complete departure from bureaucracy, which is unthinkable anyway, but rather to build on or augment bureaucracy (Yeboah-Assiamah et al. 2015). Citizens' engagement with their government has been seen to improve overall performances of the state structure in modern time in the areas of accountability, transparency, and responsiveness. Thus, application of effective accountability mechanisms, administrative procedures, data collection and reporting, and field monitoring must be emphasized (Ukeje et al. 2020c, p. 5) in the state-citizens interaction. In a sense, it has potential, provided it is properly applied, to enhance compliance to governance ethics as performance optimization recipe. Thus, a citizen-centered ECSC should reposition the citizens as active agents in the entire public service ethical governance process. According to Farazmand (2016, p. 7), "political leaders and professional public administration need and can design and implement formal and informal institutional channels and systems to achieve democratic accountability in modern governance."

## The Political Economy of ECSC: Going Beyond Whistle-Blowing

It has been sufficiently demonstrated that sound public process requires robust governance structures (Farazmand 2012, 2017; Momen and Begum 2020). These structures should reflect six core principles of sound governance which are: properness, transparency, participation, effectiveness, accountability, and human rights (Addink 2019, p. 19). We emphasize the *participation* aspect of sound governance because despite the modest achievements of the recent whistle-blower public service reform in Nigeria that led to the recovery of proceeds of corruption to the tune of #603.78bn in less than 2 years after the policy was made, there remains a serious constrain relating to resilience and applicability. This is because although employee reporting of ethical violations is recognized as an important measure for maintaining a healthy society (Schuh 2016), not many employees who have observed ethical violations actually report them, perhaps for fear of reprisals from the authorities involved (Taylor 2018; Ayamba 2019). As Chacko (2017) posits, bureaucrats and businesses take advantage of the limited oversight established by the agencies, bringing about wide-scale cheating, overbilling, thieving, and defrauding taxpayers/stakeholders and jeopardizing the well-being of the organization and no longer take decisions based on the public interest, but instead favor a specific group (Omotoye 2018). Bureaucrats decide how public resources and authority are used and affect the manner in which services are delivered to citizens (Zacka 2018). Therefore, managing the integrity of public service in Ebonyi State and indeed in Nigeria will require more than reliance on *volitional whistle-blower* mechanism by public servants and *insiders* who may be incapacitated; or on *Public Complaints Commission* and *SERVICOM* which have been swallowed up by bureaucracy; or, for that matter, on EFCC and ICPC plagued by lack of autonomy and resources, to a more resilient design, ECSC, which should serve as center for collective action rather than the present reckless *trapped* system of public service ethics management in Nigeria. The idea being proposed here goes beyond current PS reforms in Nigeria because public accountability and anti-graft agencies like Public Complaints Commission, Code of Conduct Bureau, ICPC, and EFCC all lack the citizens-centered elements/participation, and are not even autonomous in the barest sense, thus jeopardizing sustainability and

resilience of many reform policies. Perhaps one striking character of the postmodern thought in public administration is that people buy into what appeals to them even if they "defy reason" or "do not fit neatly into any ethical ethos of public administration" (Santis and Zavattaro 2019). People seem tired of being told what is right to do by their government because they feel that the state apparatus can no longer be trusted to stand on their side; they instead want to tell the government what is right to do, through anyone, whosoever that may be, that offers them opportunity to make that happen. After all, government is said to be "of the people, for the people and by the people" (Abraham Lincoln 1863). Indeed, the present movement towards New Institutionalism is symptomatic of escalating trust crises or deficiency arising against the backdrop that even at the presence of certain sound governance principles in public service, individual and group citizens no longer feel confident that public servants can be honest and not take undue advantage of them due to its *modus operandi* (Mishra and Momin 2020). Results from interviews with some officials of Nigeria public service and citizens supports this finding that though certain elements of sound governance may exist in a public service, its *modus operandi* could be a serious problematic and alter its expectations as is the case with Nigeria where they exist in forms of informal structures exploiting public goods rather than creating it.

## Conclusion

No doubt, "in this age of rapid globalization, bureaucracies everywhere are now forced to learn to adapt and change, open up secret and monopolistic information, share it with citizens and other organisations, and perform with transparency and ethical standards" (Farazmand 2009, p. 14). This entry represents one of the first attempts in providing some interesting insights into the negative impact of ethical noncompliance measures and poor accountability framework of Nigerian public bureaucracy and its associated effect within the context of governance and social accountability. It complements to the bureaucratization studies and the effects of the Nigerian power-sharing dynamics (see: Idike et al. 2019; Ukeje et al. 2019) in promoting the theory and practice of "bio-politics" and "geo-politics" in Nigerian public administration scholarship (Ukeje et al. 2020a) and governance. Interestingly, in this era of New Public Governance (NPG) and co-production, this entry argues for the institutionalization of a citizen-centered ECSC, as part of the much bigger NPM agenda aimed at enhancing and or improving the quality of public service delivery, restoring trust and accountability by establishing strong relationship/partnership between the citizens and the government. This is because the NPG paradigm advocates for governance characterized by partnerships, collaboration, and networks. Sound governance, according to Farazmand, promotes democratic values by increasing citizen participation at all levels of government. So, whether or not sound governance underlines the administration of the country's affairs provides the background of the national political, economic, bureaucratic, and social conditions. Thus, "creating mechanisms and processes that would infuse a sense of partnership in the system will result in a far-reaching contribution of the employee" (Ndukwe et al. 2020, p. 3). This no doubt will serve as a recipe for sound-administrative governance and the attainment of sustainable development in Nigeria's public sector organizations. It will also help to restore the legitimacy of public service in Nigeria and other developing countries in general, and also, help to significantly reduce illicit financial and arms flows, strengthen the recovery and return of stolen assets and combat all forms of organized crime as contained in the UN SDGs (16.4) targets; substantially reduce corruption and bribery in all their forms (16.5) targets; and develop effective, accountable and transparent institutions at all levels (16.6) targets by 2030.

# Public Service Ethics, South Korea

Pan Suk Kim
College of Government and Business, Yonsei University, Wonju, Gangwon, South Korea

## Synonyms

Ethics; Public service; South Korea

## Definitions

Public service ethics deal with a wide range of the ethical issues of the public service.

## Introduction

The South Korean government has made various efforts over the years to strengthen its public service ethics. At the core of such efforts was the enactment of several laws including the Public Service Ethics Act of 1981, the Anti-Corruption Act of 2001, and the Improper Solicitation and Graft Act of 2015. Of the three acts, the Public Service Ethics Act is the most important in any discussion on the ethics of government officers, as it is the most comprehensive act (Kim 2009, 2010, 2011; Kim and Yun 2017). In other words, the most important law for improving public service ethics is the Public Service Ethics Act of 1981; subsequently, this chapter's discussion will be based on this Act. Public service ethics are intended to ensure fairness. Such vocational ethics should be applied by public servants in providing conditions that prevent conflict between public and private interests (e.g., preventing public servants from illegally gaining property and ensuring that the public is not forced to adhere to private interests) (OECD 2003, 2005). The public service ethics system can be divided into the main components of property registration, the disclosure of personal assets and review system, the blind trust stock system, the gift reporting system, and the post-employment and activity restriction system for retired public officials. The Ministry of Personnel Management (MPM) is the South Korean government's central personnel authority. The MPM directs the overall personnel system, while a Public Service Ethics Committee is installed at each public agency to review property registrations, verify post-employment restrictions and approvals, and resolve measures violating the Public Service Ethics Act (MPM 2018). Accordingly, this chapter will explain the public service ethics system in addition to providing detailed explanations of property registration, the disclosure and review system, the blind trust stock system, the gift reporting system, the public employment and action restriction system for retired public officials, and the public ethics information system.

## Public Service Ethics System

The South Korean government enacted the Public Service Ethics Act on December 31, 1981, and it became fully effective on January 1, 1983. The Act's contents were limited to the public servant property registration system, the gift reporting system, and the post-employment restriction system for retired public officials. It was established to install a Public Service Ethics Committee in the National Assembly, Supreme Court, and both the central and local governments.

After many years of authoritarian regimes under presidents who were military generals, a new South Korean civilian government became active in 1993. Thus, the Public Service Ethics Act was substantially amended on June 11 of that year. This was instigated to prepare for a clean public service environment and to implement administrative reform, which was motivated by the voluntary disclosure of property by Kim Young-Sam, who served as the president of South Korea from 1993 to 1998. While property registration had already expanded to include Grade 4 public officials and local council members, the amendment required public officials of Grade 1 or higher (including political appointees) to disclose their personal property (the South Korean government contains nine grades. Grade 1 is the highest level among career civil servants, while Grade 9 is the lowest). Together with the property registration content review and the reinforcement of disciplinary actions and sanctions for false registrations, this granted the Public Service Ethics Committee the right to review the property of officials and allowed persons who were not dependents of the public official to reject the notice of property registration.

The Public Service Ethics Act was again amended on December 31, 1994, to grant the Public Service Ethics Committee the right to demand data from financial institutions. This also allowed the committee to administer warnings and perform corrective action in cases where property subject to registration was omitted or if the registration contained miswritten data through gross negligence.

An amendment on January 26, 2001 required that the person subject to property disclosure submits a stock transaction report when reporting property changes and reinforced post-employment restrictions for public officials. Previous amendments required public officials to refrain from taking employment with private companies that were related to their public service jobs within 2 years of retirement. However, the new amendment strengthened these requirements by extending this period to 3 years (2 years for organizations or foundations founded by the same company).

An amendment on May 18, 2005 introduced the blind trust system for persons subject to personal property disclosure and prevented persons of Grade 4 or higher who were in charge of finance from illegally increasing property by trading stock or influencing stock prices using information obtained as a result of their high-ranking position.

An amendment on December 28, 2006 limited the notice rejection system to cases in which prior authorization had been obtained. This prevented the possibility of reducing or concealing property by abusing the system. If it is necessary to review matters related to property registration, the amendment also allowed the committee to demand an explanation of how wealth was accumulated from persons subject to property disclosure.

An amendment on February 3, 2009 adjusted the range of relatives the person subject to property registration could allow to register property to direct ascendants and descendants of the principal. It also established a provision to postpone or exempt the reporting obligation if individuals had difficulty reporting property because of imprisonment.

The Act was amended on to July 29, 2011, to extend the number of civilian Public Service Ethics Committee members from five persons to seven. Regarding post-employment restrictions for retired public officials, the job relation criterion was increased from 3 years within retirement to 5 years. The system was further reinforced by expanding the institutions subject to employment review from private commercial enterprises to

those involved in law, accounting, and tax service firms of certain sizes. In addition, the amendment introduced a job restriction system in which retired public officials were prohibited from engaging in jobs that they were directly engaged in during their public service tenure and restricted activity involving illegal solicitation or arrangements provided to the institutions for which the retired public official had worked.

An amendment on December 30, 2014 focused on reinforcing post-employment restrictions for retired public officials to eliminate public-private-linked corruption while further promoting public service fairness. It expanded the post-employment restriction period from 1–3 years and added restrictions to market-type public enterprises and public service-related organizations operating in the areas of safety supervision, permits, safety authorization, and procurement. Provisions were also added to expand the range of jobs from businesses of the department to businesses of the institution for which individuals were required to disclose both post-employment review results and the job approval review conducted by the Public Service Ethics Committee which was amended to include public officials of Grade 2 and above.

An amendment on December 29, 2015 required that financial and real estate information be provided to improve the efficiency and convenience of the property registration process during occasional property reporting. It also allowed the public official subject to blind trust requirements to change positions related to stock or selling of stock where conflict became apparent. In cases where the public official was unable to sell stock, the amendment prohibited them from becoming involved in related duties. In addition, the ex officio reexamination system was introduced to improve the appropriateness and reliability of decisions made by the Public Service Ethics Committee and the Blind Trust Stock Review Committee.

## Property Registration and the Disclosure and Review System

The property registration and disclosure and review systems require public officials of Grade 4 and higher to register properties held by themselves in addition to those owned by their spouses and direct ascendants and descendants. Grade 1 and higher-ranking officials must disclose their registered properties for the Public Service Ethics Committee to review the property registration and wealth accumulation processes.

### Property Registration System

Public officials subject to property registration are defined in Article 3 of the Public Service Ethics Act. This includes public officials involved in state political services, including the president, prime minister, cabinet members, members of the National Assembly, and public officials working in both central and local government agencies of Grade 4 and above (e.g., superintendents of education, judges and prosecutors, officers with the ranking of colonel or higher, and executives of public service-related organizations).

Considering the characteristics of duty in areas with a high vulnerability to conflict of interest, "the Enforcement Ordinance of the Public Service Ethics Act" system also subjects an additional number of public officials to the property registration requirement. Such officials include those of Grade 7 and higher in the areas of police work, firefighting, auditing, tax services, accounting, and high-ranking managers and executives in the Financial Supervisory Service and public organizations such as the Bank of Korea, the Korea Deposit Insurance Corporation, and the Nuclear Power Generation.

Properties subject to registration include all those possessed by the subjects themselves, their spouses, and direct descendants and ascendants (e.g., real estate such as land, buildings, superficies, and leasehold rights and moveable assets such as cash and deposits, securities, certain precious metals, and memberships). Individuals who are descendants and ascendants of the public official subject to property registration but who do not receive their support may reject the notice that requires them to report their properties. However, this is only allowed when prior authorization has been obtained from the Public Service Ethics Committee, thus preventing the intentional reduction or concealment of property. The case is then subject to reexamination every 3 years.

The institution requiring property registration is that to which the subject belongs. For example, public officials of the ministry and office of the government must report to those institutions. Subjects of the local government must report to the local institution, while members of the National Assembly must report to the secretariat, and judges must report to the Court Administration Office.

Following a 2-month period from the day the obligation was generated, the registration deadline is the last day of the month. In cases reporting regular changes, registration should be completed by the end of February of the following year. Property registrations are completed using an official form submitted to the Public Ethics Information System. Reports include personal details, the status of relatives, and properties possessed as of the online reference date.

### Property Disclosure System

Public officials subject to property disclosure include the president, minister, and vice minister, all public officials of Grade 1 and above, National Assembly members, heads of local government, local council members, and superintendents of education. It also includes judges of High Court chief judge grade and above, prosecutors of the Supreme Prosecutor's Office of prosecutor grade and above, heads of public service-related organizations, and the heads and permanent auditors of public enterprises and agencies.

In addition to the above, individuals who wish to become candidates for president, the National Assembly, or local council must disclose property information when announcing their candidate registrations. Public officials requiring the consent of the National Assembly (e.g., the Chief Justice of the Supreme Court, head of the Constitutional Court, and prime minister) should also disclose matters related to property registration. Public officials elected by the National Assembly (e.g., judges of the Constitutional Court) should disclose matters related to property registration when submitting motions regarding their appointments.

The main agency overseeing matters of property disclosure is the Public Service Ethics Committee. The committee must publish matters regarding the properties of the principal, their spouse, and direct ascendants and descents in addition to changes in the official gazette or public bulletin within 1 month after the reporting period.

### Property Review System

The Public Service Ethics Committee reviews matters related to property registration of public officials in its jurisdiction. The reviewed content is matters related to faithful registrations. According to Clause 10, Article 8 of the Public Service Ethics Act, the public official subject to property disclosure (including all subjects) should pass the review within 3 months of the disclosure. If necessary, the review period can be extended by an additional 3 months by resolution of the Public Service Ethics Committee. There is no explicit regulation of public officials not subject to disclosure. However, because it is difficult to review all personnel, reviews are made according to selective criteria defined by the Public Service Ethics Committee.

If necessary, the Public Service Ethics Committee may order additional property registration documents from the subject of review. The committee may demand that the subject submit the required data in addition to answers to written questions and fulfill an investigation to verify certain facts. It may also demand reports or data submitted to the related institution or organization. Notwithstanding other laws, the head of that institution or organization shall not reject the request for such reports or data submissions. The committee may demand both the attendance of the subject person and persons related to the property registration process.

In the meantime, persons who are suspected of committing false property registrations or have acquired benefits using secrets obtained during their public service tenure may be subject to an investigation by the Minister of Justice or the Minister of Defense (in cases of serviceman or civilian workers in the military) as requested by the Public Service Ethics Committee. In such a procedure, the review report is prepared and submitted to the Public Service Ethics Committee as an agenda according to the disposition after resolution. The subject and related institutions (e.g., institutions to which the subject belongs and the court) are then notified of the results. The review

results depend on the level to which the Public Service Ethics Act was violated (e.g., the amount of misreported data). The subject is then punished with a warning, corrective action, a fine of 20 million won or less, public announcement of the violation in the daily newspaper, or dismissal.

The probability of illegal property accumulation can be reduced by requiring property registration from public officials involved in areas of high conflict between public and private interests. This also has the effect of improving the transparency of public officials' properties and ensures fairness in the policy-making process by enabling the press and other entities to monitor them.

## Blind Trust Stock System

A blind trust is a type of trust fund that is designed to mask the assets therein from the person designated to receive the proceeds. In the event that a high-ranking public official or interested parties possess stocks, public and private interests are likely to conflict through the public service process. Thus, the blind trust stock system requires public officials to dispose of stocks related to their duties but allows them to retain unrelated stocks. Public officials subject to this system are those also subject to property disclosure in addition to those of Grade 4 and higher in the department in charge of financial affairs in the Ministry of Strategy and Finance and the Financial Services Commission.

Relevant stocks are those owned by the subject and interested parties (i.e., spouses and direct ascendants and descendants) when the total amount exceeds 30 million won. The reference date at which obligation to the blind trust stock system occurs is that when either the stocks possessed exceed 30 million won (including when the total amount of stocks exceed 30 million as prices are raised), the principal becomes the subject of disclosure, the public official subject to disclosure changes jobs (e.g., to a permanent committee position), or a decision is made regarding the stock's relation to the job.

Public officers subject to the blind trust stock system should report to the property registration institution after selling the stocks, placing them into a blind trust or requesting a job relation review from the Blind Trust Stock Review Committee installed in the Ministry of Personnel Management. A public official may request a job relation review after changing positions if they suspect that the position is related to stocks possessed. If they receive notification that the stocks are related, the stocks should be sold or placed into a blind trust within 1 month of receipt.

Although individuals may avoid conflict of interest by placing stocks into a blind trust, the job recusal system was introduced. This is because there are many cases in which ownership is returned to the trustor because disposal is difficult once the public official is relieved from duty by retirement or term expiration. If an official is not able to dispose of stocks placed into a blind trust, the job relation review may not be completed after requesting a change of position. Involvement in a job related to possessed stock is prohibited. If job recusal is impossible because of related laws or other factors, the recusal system provides that the public official should later report their involvement to the Public Service Ethics Committee, which then discloses relevant reports through the official gazette or public bulletin.

There may be cases in which public officials do not report violations involving stock sales or a blind trust, are involved in jobs related to possessed stock although they have been recused, and do not report that they were involved in the job or there is termination of the trust contract due to violations caused by blind trust contract. These cases shall be cause for dismissal or demands for disciplinary resolution. If the public official does not sell or place stocks into a blind trust, thus violating the blind trust obligation without justifiable reason, they shall be subject to imprisonment of less than 1 year or a penalty of less than ten million won.

## Gift Reporting System

Public officials cannot receive rewards or gifts related to their duties but may find it difficult to refuse gifts from foreign countries, as is

diplomatic and international custom. In such cases, public officials are allowed to receive these gifts and report them later. Public officials subject to the gift reporting system include local council members and executives of public service-related organizations. If a public official receives a gift worth 100,000 won or more from a foreign government or other entity (including foreign organizations), they should report this to the organization to which they belong. If the price is unknown but is less than 100,000 won, the official is not required to report it.

The relevant organization should report gifts to the head of the registration institution (the head of the Ministry of Personnel Management in the case of the central administrative agency and the public service-related organization supervised by the central administrative agency) on a quarterly basis. Gifts should be transferred to the registration institution semiannually. The head of the registration institution should transfer gifts having cultural or artistic value to the National Archives of Korea. Gifts that require management by other relevant institutions are transferred accordingly, while gifts that do not require management become national property through the Public Procurement Service, which will then dispense with them. Public officials that do not report or transfer gifts worth 100,000 won or more that they have received from relevant foreign entities shall be subject to dismissal or disciplinary resolution. This promotes the ethical behavior of public officials by requiring them to report gifts that they will inevitably receive through diplomatic and international customs, which should be systematically managed by the national treasury.

## Retired Public Official Employment and Activity Restriction System

Retired public officials are restricted from accepting employment from organizations that were related to services performed during their public duties. They are also restricted from direct involvement in businesses they managed as a public service or businesses that the institution they belonged to managed. They are also restricted from actions of solicitation to the institution they belonged to before their retirement or arrangements of employment provided by that organization. Public officials and executives of public service-related organizations, from which they retired as persons subject to property registrations, are restricted from accepting employment at institutions having close relations with the business of that department for 5 years before and 3 years after their retirement date. However, they may accept employment after obtaining approval from the Public Service Ethics Committee.

Restricted employment organizations are announced by the Minister of Personnel Management. These may include commercial enterprises larger than a certain size, law firms, accounting firms, tax firms, market-type public enterprises, public service-related organizations performing safety supervisions, permits and authorizations, regulation and procurement businesses, private colleges and their educational foundations, general hospitals and their foundations, and social welfare foundations larger than a certain size. The range of restricted organizations was greatly expanded by lowering the size conditions for private enterprises on June 25, 2014. Nonprofit organizations were also designated as restricted on March 31, 2015.

The post-employment review is divided into two parts (i.e., the post-employment restriction verification review and post-employment approval review). The post-employment restriction verification review verifies whether the public official can be employed or is restricted through the judgment of having close relations to the business of the department or institution to which they belonged within 5 years of retirement. The post-employment approval review verifies whether there is any special reason to allow employment despite such concerns.

Business restrictions can be classified into two types: those managed by the subject and those based on institutional business. Those managed by the subject are targeted at all public officials and executives of public service-related organizations. Except cases in which other laws provide dispensation, these individuals cannot become

involved in jobs related to those provided in Clause 2, Article 17 of the Public Service Ethics Act (i.e., financial assistance, permits and authorizations, inspections and audits, taxation, contracts, supervision, direction, and investigations) that were directly managed by the subject during public service. There is no limit to the subject's organization or period of service. For cases in which the Public Service Ethics Committee suspects that a retired public official has violated such restrictions, it can request the related dates of employment from the institution to which the official belonged when retired (e.g., the National Pension Service) for verification.

Subjects must not handle business listed in Clause 2, Article 17 of the Public Service Ethics Act if such business had been handled by the institution to which the subject had belonged 2 years before retirement. For retired public officials subject to employment reviews based on the businesses of the institution, those who were employed by the restricted employment organization should prepare and submit their job details (including business activity details) to the Public Service Ethics Committee after obtaining approval from the head of the restricted employment organization to which they belong. In the event that a retired public official needs to handle relevant business for reasons of national security or the public interest and it is recognized that handling such business does not affect fair treatment, they are allowed to continue working after obtaining approval from the Public Service Ethics Committee.

All retired public officials and executives of public service-related organizations are prohibited from soliciting or arranging deals with the employees or executives of the institution to which they had belonged before retirement if it affects fair service performance or results in benefits to themselves or a third party. Public officials and executives of public service-related organizations that are asked to do so by a retired public official should report it to the head of the institution to which they belong. The identity of the reporting individual cannot be disclosed without their consent, and the reporting may not result in any disadvantage to their position, nor should they receive discrimination from their institution (e.g., disciplinary measures). Public officials that are subject to employment review should not solicit employment from a restricted organization related to the businesses prescribed in Clause 2, Article 17 of the Public Service Ethics Act if such businesses had been managed by the official 5 years before retirement. In addition, heads of national institutions, local governments, or public service-related organizations should not arrange employment for such officials in any of the restricted employment organizations listed in Clause 2, Article 17 of the Public Service Ethics Act if such business was managed by the official 5 years prior to retirement.

The post-employment and activity restriction system prevents the formation of close relationships through which a public official may grant preference to a specific organization for the purpose of obtaining employment after retirement. It also prevents such officials from exercising illegal influence on the institution to which they belonged after retirement. This system was designed to secure the fair execution of public duty by eliminating privileges obtained through former public office or by private-public adhesion. Such measures enhance the trust of the people in their public officials.

## Public Ethics Information System

The Public Ethics Information System was constructed in 1999, as a public ethics business portal used to process electronically the business related to the public service ethics system. This includes property registrations, disclosures by public officials, and property reviews. The Ministry of Personnel Management manages most public human resource management including system planning and the operation of the Public Ethics Information System. The Public Ethics Information System is commonly used not only by the central government but also by the National Assembly, local governments, the Constitutional Court, and 265 Public Service Ethics Committees across the country. The Public Ethics System creates a separate operation of the property

registration and business review systems in the DOS environment. The web-based property registration system was built in December 2005. This enabled property reporting from any location anytime through Internet access.

Public officials subject to property registration can also use a series of related functions (e.g., they can register personal information, submit information provisions and consent forms, report up to 16 property items, and submit explanatory data). Persons in charge of business ethics can use the system to perform business related to property registrations and reviews (e.g., they can manage public officials subject to property registrations, verify information provision consent forms, authorize notifications of rejection, and perform property reviews).

In the meantime, institutions can use the system to provide information to the property registration institution, related to the real estate holdings and the finances (e.g., deposits and debts) of public officials subject to property registrations. A system administrator may use the system to conduct user registrations, code management, and bulletin board and data room operations. In addition, individuals without direct relation to property registrations or similar functions can use the system to increase their understanding of the Public Service Ethics Act and public service ethics system.

The Public Ethics Information System is used by approximately 230,000 subjects of property registrations, around 600 property registration personnel, and about 240 information provision institutions related to finance, real estate, and membership. Public officials subject to property registrations can report properties online at anytime and anywhere an Internet connection is available. Since the financial and real estate information of the principal and their relatives can be provided in this manner, accurate and convenient reporting is possible. A link to the Realty Price System also provides real-time realty prices.

For persons in charge of public service business ethics, the systematic management of public officials subject to property registrations facilitates the entire process. This includes the management of personnel affairs, rejection notices, individuals who agreed to the information provision, and submission reports. In addition, reporting histories can be systematically managed by providing the flow of property by year, property size, and item within the registered property database. Property transparency reviews can be obtained through the online business treatment process (for instance, this includes both explanation requests and submissions of explanation for misreported items, while excessive or omitted property information can be identified through a total comparison of the data reported by the subject and the review data).

## Concluding Remarks

The Public Service Ethics Act originally enacted in 1981 covers a variety of ethical issues. However, the essential provisions thereof concern registering the property of government officers, restricting employment after resignation or retirement, and a blind trust for stocks (Kim 2010; Kim and Yun 2017; MPM 2018). The Public Service Ethics Act was amended several times over the years. One meaningful amendment to the Public Service Ethics Act was the introduction of a blind trust stock system in 2005. Higher-level government officials in sensitive positions often place their personal assets into blind trusts in order to avoid public scrutiny and accusations of conflict of interest. The Public Service Ethics Act also prescribed that government officers would be subject to post-employment review and that officers and employees of state-owned entities would be prohibited from being employed by a for-profit private company of a certain size whose business is closely related to the job the applicable government officer carried out for 5 years before his or her date of resignation or retirement. This would apply until 3 years past the date of resignation or retirement unless such employment was approved by the Public Service Ethics Committee (Kim and Yun 2017).

As mentioned earlier, in order to strengthen public service ethics, the Korean government has made various efforts over the years, including the enactment of major acts including the Public

Service Ethics Act. The government and the National Assembly played an important role in these processes, but they were not the only key players. In fact, a number of Korean civil society nongovernmental organizations (NGOs) promoted ethical issues publicly and helped them materialize as public policies and laws. In the Korean context, how discussions related to public service ethics and anti-corruption were initiated is closely related to political democratization and the growth of civil society. In the late 1980s and thereafter, Korean society witnessed a great deal of political and social democratization, as well as the steady growth of many reformist civil groups, both of which caused various reformative issues and agendas to be proposed. With the active and steadfast efforts by reformist NGOs and the election of democratic presidents with progressive ideas, such as Kim Dae-Jung (presidential term from 1998 to 2003) and Roh Moo-Hyun (presidential term from 2003 to 2008), a statutory foundation for applicable laws and systems was established. Of course, such laws and systems cannot yet be deemed to have fully achieved their expected goals. They still need to be improved to mend their many deficiencies. The improvement of civic awareness and culture and the establishment of appropriate systems will have to be carried out simultaneously.

## Synonyms

Civil service; Public authorities' employees; State service

## Legal Basis of the Public Service in the Russian Federation

There are two types of public service in Russia: State service and municipal service. It is caused by the fact that, according to the Constitution of the - Russian Federation, the local government is the independent form of power and is not a part of the system of State authorities. Therefore, the local government personnel are municipal servants, and the personnel of State authorities are State servants. The Federal Law "On the municipal service in the Russian Federation" of March 2, 2007, № 25-FZ determines only the basic terms of the organization of municipal service.

Legal regulation of public service in the Russian Federation owing to the federal structure of the State is performed on two levels:

- National (federal) legislation
- Legislation of the territorial entities of the Russian Federation (the subjects of the RF)

The legislation on public service is based on the Constitution of the Russian Federation which

establishes such principles as the unity of the system of the State power system (Art. 5) and equal access for citizens to public service (the p. 4 of Art. 32) (The Constitution of the Russian Federation 1993).

In general, public service in the Russian Federation at the federal level is regulated by the specialized legislation, which is a set of federal laws, Decrees of the Russian President, Decisions of the Government of the Russian Federation, and other regulations. In aggregate, these regulations set up all key procedures of the organization of public service. The general labor law does not regulate the activity of State servants. However, the municipal service (i.e., service in local government) is regulated by both the specialized legislation and the Labor Code of the Russian Federation.

The contemporary system of the public service in Russia was formed as a result of the comprehensive reform, which began in the 2000s. The reform was aimed at the qualitative transformation of the public service institutions, improving the performance of public servants, the implementation of effective public service staffing, information, education, anti-corruption, and human resources management techniques.

## Legal Regulation of State Service in the Russian Federation

The Federal Law "On the System of the State Service of the Russian Federation" was adopted on May 27, 2003. The Law contains general terms and conditions of the State service and establishes the State service management system in the Russian Federation.

This Law establishes that the State service of the Russian Federation is the professional service activity of citizens of the Russian Federation on ensuring the exercise of powers of:

- Russian Federation and federal State authorities
- Subjects of the Russian Federation and public authorities of subjects of the Russian Federation
- Persons holding public positions of the Russian Federation and the subjects of the Russian Federation, which are designed for direct execution of powers of State authorities (e.g., elected officials, ministers)

Based on this definition, State servants in Russia are only those employed by public authorities. Unlike some other states, in Russia employees of educational and healthcare institutions are not considered as State servants.

The basic principles of the organization and functioning of the State service system are:

- Federalism, ensuring unity of the State service system and the delimitation of competence and powers between the federal public authorities and public authorities of subjects of the Russian Federation
- The rule of law
- Priority for human and civil rights and freedoms, their direct effect, obligation of their recognition, observance, and protection
- Equal access of citizens to the State service
- The unity of the legal and institutional framework of public service, which implies the unified approach to the organization of certain kinds of State service
- The interrelation of State service and municipal service
- The openness of the State service and its availability to public control, objective informing of the society about the activities of State servants
- Professionalism and competency of State servants
- Protection of State servants from undue interference in into their professional activity

The Federal Law "On the System of the State Service of the Russian Federation" establishes the general conditions for personnel selection to the State service, its passage, and termination. For example, he defines basic requirements for candidates for State service positions, establishes the types of service contracts, etc.

In accordance with the federal laws on the types of State service, the citizens passing the federal State service are assigned to the

appropriate class ranks, diplomatic ranks, and military and special ranks.

## The System of the State Service in Russia

The system of the State service of the Russian Federation is a combination of several kinds of State service:

- State civil service
- Military service
- State service of other types

The last group includes mostly different types of law enforcement service, responsible for security, law, and order, crime prevention, and protecting the rights and freedoms of man and citizen (e.g., the police, the Prosecutor's Office, the Federal Penitentiary Service, etc.)

The military service is also a specific type of State service in the Russian Armed Forces and the relevant government authorities responsible for the defense and security of the State.

The State civil service ensures an implementation of the common administrative and sectoral functions of public administration providing the work of all State authorities not related to the Russian Armed Forces and the law enforcement system. However, in the military and law enforcement government agencies, along with specialized, there are also positions of the State civil service. Thus, the State civil service provides the implementation of the functions and powers of all State authorities in the Russian Federation.

## The State Civil Service of the Russian Federation: Legal Regulation

According to the Federal Law "On the System of the State Service of the Russian Federation," the State civil service is a professional office activity of citizens of the Russian Federation at the civil service positions on ensuring the exercise of powers of the Russian Federation and federal public authorities, subjects of the Russian Federation and public authorities of subjects of the Russian Federation, persons holding public positions of the Russian Federation, and the subjects of the Russian Federation, which are designed for direct execution of powers of public authorities.

The State civil service of the Russian Federation is subdivided into the federal civil service and the civil service of the subjects of the Russian Federation. The federal structure of Russia causes this.

Legal regulation of the State civil service of subjects of the Russian Federation is the joint jurisdiction of the Russian Federation and subjects of the Russian Federation – and its organization – in the jurisdiction of the subject of the Russian Federation. Accordingly, the State civil service of subjects of the Russian Federation is regulated not only by the federal legislation but also with regional laws and regulations.

The basic for the State civil service is the Federal Law "On the State Civil Service of the Russian Federation" dated July 27, 2004. It regulates in detail the legal, organizational, and financial basis of the Russian civil service.

At the same time, the provisions of the federal law are supplemented with the significant number of the Decrees of the President of the Russian Federation detailing certain aspects of the civil service career. For example, Decrees of the Russian President establish the general ethical principles of civil servants behavior, the procedure of the certification of civil servants, and the order of providing by civil servants the asset declarations, verifying their content and many other issues.

## The Classification of Positions of the State Civil Service of the Russian Federation

Positions of the State civil service are divided into four categories:

- Heads
- Assistants (counsellors)
- Specialists
- Providing specialists

The first category includes positions of both actual heads of the State bodies and their deputies and heads of territorial structural divisions and offices of federal government bodies.

Positions of assistants or counsellors are established to assist the heads of State bodies in the exercise of their powers. Their activities are limited to the term of the heads. Positions of assistants or counsellors, for example, include the assistant (counsellor) Deputy Prime Minister of the Russian Government, the assistant deputy of the State Duma, and counsellor to the Minister of the Russian Federation.

Positions of specialists are established for direct implementation of tasks and functions of State bodies. Specialists generally perform the work for which a State authority has been established. According to the Federal Law "On the State Civil Service of the Russian Federation," the positions of specialists established for professional ensuring accomplishment by State bodies of certain tasks and functions.

Persons holding positions of the providing specialists do not implement directly the functions of State bodies. Rather, they provide a stable functioning of the State authority. These positions established for organizational, information, documentation, financial, and economic support of State bodies' activities.

Along with categories, all positions of the State civil service of the Russian Federation are subdivided also into five groups of positions:

1. The highest positions of civil service
2. Main positions of civil service
3. Leading positions of civil service
4. Senior positions of civil service
5. Junior positions of civil service

In addition, each category of positions is subdivided into a certain number of groups. Positions of categories "heads" and "assistants (counsellors)" are divided only into the highest, the main, and the leading groups of positions of civil service; positions of category "specialists" – into the highest, main, leading, and senior groups of positions; and positions of category "providing specialists" – into the main, leading, senior, and junior groups of positions of civil service (see Table 1).

## Distinctive Features of the Legal Status of Civil Servants: Restrictions and Prohibitions on the State Civil Service

Establishment of the restrictions and prohibitions relating to the civil service career is one of the most important and widespread in the world tools of fighting corruption and the prevention of conflicts of interests in public officials' activities.

In the Russian legislation on the State civil service, the term "restrictions" is used to refer to conditions that prevent hiring of a citizen on the civil service or further being of a civil servant on service. That restrictions work both at revenues to civil service and when passing civil service. In these cases, the employee will be dismissed, and the candidate for the civil service post will be denied appointment.

**Public Service in Russia, Table 1** Ratio of categories and groups of State civil service positions

| | | Groups | | | | |
|---|---|---|---|---|---|---|
| | | The highest positions | Main positions | Leading positions | Senior positions | Junior positions |
| Categories | Heads | ✓ | ✓ | ✓ | | |
| | Assistants (advisers) | ✓ | ✓ | ✓ | | |
| | Specialists | ✓ | ✓ | ✓ | ✓ | |
| | Providing specialists | | ✓ | ✓ | ✓ | ✓ |

These restrictions, for example, include:

1. Recognition of citizen as lacking dispositive capacity by a court decision
2. Condemnation of citizen to punishment under the verdict of the Court, as well as having a criminal record which is not expunged or not extinguished
3. A disease preventing entry into the civil entry into the civil service or its passing confirmed with the conclusion of a medical organization
4. Close relationship by blood or in-law (parents, marriage partners, children, brothers, sisters, and brothers, sisters, parents, children of the marriage partner and marriage partners of children) with civil servants, if civil service position is associated with direct subordination or the control of one of them to another
5. Renunciation of citizenship of the Russian Federation or acquisition of another citizenship
6. Submission of false documents or false data upon admission to the civil service
7. Failure to provide information or submission of false information about income, assets, and obligations of property
8. Loss of confidence in the civil servant in cases of non-compliance with the restrictions and prohibitions, requirements on the prevention of conflicts of interest, and other requirements established by anti-corruption law.

The Federal Law "On the State Civil Service of the Russian Federation" sets the prohibitions on the civil service. The term "prohibitions" combines those activities or actions that civil servants are forbidden to perform during service and, in some cases, after the retiring from service.

For example, civil servants are prohibited from:

- Combining of a civil service position with elected public posts.
- Engaging in business activity personally or through authorized representatives.
- Receiving any kinds of rewards from persons and organizations in connection with the performance of official duties (gifts, money, loans, services, payment of entertainments, rest, transportation expenses, and other remunerations). Russian civil servants can only receive official gifts during the protocol meetings and official events.
- Disclosing or using for purposes not related to the civil service, confidential information, or proprietary information, which became known in connection with the performance of official duties.
- Making any public statements, judgements, and estimates, including those in the mass media, in respect of the activities of public authorities, their officials, if this is not included in his official duties.
- Using of official powers for the benefit of political parties, other public associations, religious associations, and other organizations.
- Shutting down the performance of official duties in order to resolve a service dispute.

Some of the prohibitions are imposed on citizens who had resigned from the civil service.

For instance, a citizen after his resign from the civil service shall not have the right to disclose or use, for the benefit of organizations or individuals, confidential information or official information that has become known to him in connection with the performance of his official duties.

Also a citizen who left a civil service post of a certain group shall not have the right to find employment in an organization, in respect of which he or she performed public administration functions, without the permission of the relevant commission on the managing conflicts of interest.

Non-compliance with restrictions and violation of the prohibitions related to the civil service are the basis for dismissal of a citizen from civil service.

## Entry into the State Civil Service: Personnel Assessment

The State civil service is a professional activity that requires the creation of high-quality staff selection system and effective evaluation of effectiveness of the employees and their professional and personal qualities.

The civil service is entitled to enter the citizens of the Russian Federation who have reached the age of 18 years, know the state language of the Russian Federation, and conform to the relevant qualification requirements.

Among the qualification requirements are:

- Requirements for the level of professional education, to a degree, field of study
- Requirements for the civil service experience or the experience of work, field of study
- Requirements for knowledge and skills, which are necessary for the performance of official duties

Junior and senior groups of the civil service positions do not require any experience.

By the general rule, appointment to positions of the State civil service is performed on the competitive basis. The law on the State civil service establishes the exhaustive list of exceptions of this rule.

For example, the competition is not held at the conclusion of a fixed-term service contract. The competition does not provide for the positions of category "heads" which appointment is made by the President of the Russian Federation and the Government of the Russian Federation. Appointments to the civil service positions from the personnel reserve are also held without competition. The competition is not held in the provision of civil servant another post if for health reasons he is unable to perform duties on the displaced post.

Competitive selection procedure is to evaluate the candidates entitled to participate in the competition in accordance with the Federal Law "On the State Civil Service of the Russian Federation." For this purpose in every public authority, the competitive Commissions are created, which along with the State body representatives composed of independent experts.

The competitive Commission evaluates candidates based on several methods of the evaluation of professional and personal qualities of the candidates, including individual interviews, questionnaires, group discussions, and testing on issues related to the performance of official duties on vacant civil service position.

The main technology of further evaluation of the personnel in the civil service is the certification of civil servants. The procedure of regular certification is designed to maintain a high professional level of civil servants. The results of the certification define in what measure the civil servant corresponds to the position. Certification is carried out, usually once every 3 years.

Certification may be grounds for demotion or promotion on service, direction of a civil servant for additional professional training, and, in some cases, dismissal from the service.

## Conclusions

Since the early 2000s, the Institute of the Russian public service is developing dynamically. To date, a sufficiently detailed legal framework for the organization and functioning of the public service in Russia has been formed. There have been positive changes in certain staffing techniques, designed to enhance the efficiency of public servants' activities. However, the process of reforming and development of the public service has not yet been completed.

In particular, on August 11, 2016, Presidential Decree No. 403 "On the Main Directions for the Development of the State Civil Service of the Russian Federation for 2016–2018" was signed, according to which the current priorities for the development of the civil service are:

(a) Improving the management of the personnel of the State civil service of the Russian Federation and improving the quality of its formation
(b) Improving the system of professional development of State civil servants and increasing their professionalism and competency
(c) Enhancing the prestige of the civil service
(d) Improving the anti-corruption mechanisms within the civil service system

Thus, the need to take systematic measures to continue the process of reforming and developing

the institution of the public service in Russia is realized today at the political level. In the coming years, it is important to complete the qualitative transformation of the public service institution, optimize its functioning, and apply the effective modern personnel, information, educational, anti-corruption, and management techniques in the public service.

# Public Service Leaders in a Democracy: Stewards Versus Entrepreneurs

Imane Hijal-Moghrabi
Public Administration and Leadership Program, The University of Texas – Permian Basin, Odessa, TX, USA

## Synonyms

Leadership in public organizations; Public sector leadership

## Definition

Public service leadership is the leading role assumed by managers and administrators in public sector organizations.

## Introduction

The past few decades have witnessed two paradigmatic shifts in the way public organizations are being run. The first occurred with the advent of the New Public Management (NPM) movement in the 1990s, while the second occurred, simultaneously, with the shift from bureaucratic hierarchies to the New Governance – also referred to as governing across sectors, collaborative governance, or network governance. Under the banner of reform and reinventing government (Gore 1993; Osborne and Gaebler 1992), private-sector values, techniques, and practices have been introduced into the public sector. Likewise, with the new governance, government is no longer solely responsible for the provision of public services and for policy implementation as it used to be in the past. Most of government programs and services have been ever since provided by "a host of nongovernmental third party surrogates or proxies that provide programs under the agencies loans, loan guarantees, grants, contracts, and other tools of public administration" (Salamon 2002, pp. 1–2). Scholars find in the shifts to NPM and to the New Governance a blatant departure from the democratic ethos and a threat to the traditional image of constitutional democracy, where public servants and leaders are accountable to the people in whose name they govern.

One of the most debated aspects of NPM is its call for public-sector entrepreneurship, defined by Osborne and Gaebler (1992) as the use of resources in new and innovative ways to maximize productivity and effectiveness. This model of leadership has been seriously criticized by advocates of the stewardship paradigm, who question the compatibility of this model with constitutional governance (Terry 1990, 1993, 1998). Hence, it is the purpose of this chapter to assess whether these two models of public-sector leadership can be reconciled, or if one model is necessarily better suited to a constitutional democracy than the other. To this end, the chapter is subdivided into two sections and a conclusion. The first section provides a brief description of these two models, while the second section assesses the

relevance of these two models to a constitutional democracy and the possibility of reconciling them.

## The Stewardship Versus the Entrepreneurial Model of Public-Sector Leadership

Public service leadership can be defined as the leading role assumed by managers and administrators in public sector organizations. This chapter distinguishes between two competing and, even, contradictory paradigms or models of public service leadership – the stewardship model and the entrepreneurial model.

The stewardship model depicts public leaders as trustworthy, ethical agents, who are bound by an obligation to serve the public of their jurisdictions by acting as stewards of public resources, guardians of public institutions, and conservators of constitutional values (Terry 1990, 1993, 1998). These leaders are accountable toward their stakeholders (citizens, elected officials, and superiors) and are bound to abide by laws and regulations. These leaders acknowledge that the positions they hold and the resources they are in charge of do not belong to them. For government, as expressed by King and Stiver (1998), is owned by its citizens. These leaders serve rather than steer (Denhardt and Denhardt 2000), they govern by example, putting the public service first, and are willing to sacrifice their private interest for the sake of a common good (Cooper 2006).

Alternatively, the entrepreneurial model has its ramifications in liberal economies and public choice theories. As Hood (1991) points out, this market governance model involves viewing public agencies as "corporations" run by business managers, and seeks to create greater flexibility, reduced planning, and less regulation. Under this model, consumers' choice would determine whether programs would receive continued public support. This model depicts public entrepreneurs as *homo economicus* – rational economic actors, striving to maximize their utility and to promote their private interests, which are often different from their stakeholders'. These leaders steer rather than row (Denhardt and Denhardt 2000), are market driven, profit oriented, view citizens as customers (Gore 1993; Osborne and Gaebler 1992), and seek change and exploit it as opportunity (Drucker 1985). They are agents of change, innovative, visionary, and proactive – in short, they are transformational. Having defined and explored the two models of public-sector leadership, we turn now to discuss which of these two models is better suited to a constitutional democracy.

## A Better-Fit to a Constitutional Democracy or a Reconciliation?

Based on the above discussion, the stewardship model seems to be more compatible with a constitutional democracy than its entrepreneurial counterpart. One argument in support of this observation can be found in Appleby's *Government is Different*. Appleby (1959) notes that government differs from the private sector by virtue of its public nature, "the way in which it is subject to public scrutiny and public outcry. . .Government is different because it must take account of all the desires, needs, actions, thoughts, and sentiments of all Americans" (pp.122–123). This is often the case, John Rohr (1989) argues, because public administrators have taken an oath to uphold the Constitution. Thus, they have an ethical obligation to respond to the constitutional or the regime values of the people in whose name they govern – that is, "the values of the political entity that was brought into being by the ratification of the Constitution" (Rohr 1989, p. 59); responsiveness, justice, fairness, due process, equity, transparency, and accountability are some examples.

On the other hand, opponents of both NPM and the New Governance saw in the transition to these two forms of governance a threat to the public service ethos and a sacrifice of the democratic norms of equity and justice. In this sense, critics of the entrepreneurial model assert that by dissociating themselves from core administrative

values and by virtue of being self-interested, opportunistic, and risk-takers, public entrepreneurs are more prone to get engaged in unethical behavior (including fraud, theft, gift taking, conflict of interests, abuse of information, discrimination, harassment, waste and abuse, and misconduct and leisure) and rule-breaking, which constitute a moral hazard as well as a threat to democratic governance (Klothoff et al. 2006; Terry 1993, 1998). That is truly the case because the public sector is not value free (van Wart 1996, 2004) and, ultimately, cannot be run like a business (Appleby 1959). The productivity values that these leaders uphold, defined in terms of efficiency and effectiveness, often contradict with the set of values governing the public sector. For instance, the profitability value that these leaders aspire to achieve might result in goods and services that are too costly to consume, thus preventing the disadvantaged segments of society from their right to access these services, especially the basic services such as healthcare, education, and transportation – in other words, depriving citizens from their full citizenship, as Cooper (2006) argues.

Thus, it is quite clear that stewardship seems to be better suited to a constitutional democracy than entrepreneurship. However, the question remains: Is it sustainable? Indeed, today's public leaders at all levels of government, especially in localities, where leaders are in direct touch with their constituents, are called upon, more than ever before, to face the challenges of the day and to adopt innovations and new practices to help them survive the economic tough times. This implies that today's public leaders are called forth to make hard choices, to do more with less, to collaborate across sectors, and to find new means to create new resources without overburdening the citizenry. The stewardship model, despite its compatibility with democratic governance, can be rigid and, often, resistant to change; lacking the flexibility and the dispatch the entrepreneurial model enjoys in meeting the ever-changing and growing demands of society. This flexibility is equally needed to serve and to preserve democracy. Therefore, a new model of public-sector leadership is needed that seeks to reconcile stewardship and entrepreneurship by capitalizing on the strengths of both models to serve society.

Bellone and Goerl (1992) attempted to reconcile these two models by making the entrepreneurial model more civic-regarding, emphasizing the importance of citizens' participation in understanding and accepting the decisions affecting their lives, including a risk-taking behavior. In the network and collaborative governance literature, we find support to this thesis. In this sense, Denhardt and Denhardt (2000) advanced the concept of the "New Public Service" as "a set of ideas about the role of public administration in the governance system that places citizens, citizenship, and the public interest at the forefront" (p. 550). Under the New Public Service, Denhardt and Denhardt (2000) argued, public servants should be "attentive to more than the market; they should also attend to statutory and constitutional law, community values, political norms, professional standards, and citizen interests" (p. 557). Ultimately, the responsibility of government should be to promote citizenship, public discourse, and the public interest. Denhardt and Denhardt (2000) note:

> A democratic society, a concern for democratic values should be in the way we think about systems of governance. Values such as efficiency and productivity should not be lost, but should be placed in the larger context of democracy, community, and public interest . . . The New Public service provides a rallying point around which we might envision a public service based on and fully integrated with citizen discourse and the public interest. (p. 557)

More recently, there has been increased interest in emphasizing the democratic dimension of governance networks. Although the shift from bureaucratic hierarchies to network governance may challenge the traditional image of constitutional democracy, several scholars have assumed that governance networks may contribute to democratic anchorage and legitimacy, suggesting the reformulation and reconceptualization of the basic notions of democracy to make it fit the new reality (Bingham et al. 2005; O'Toole 1997). This would, actually, entail a shift in the meaning of democracy from democratic state (election) to democratic society (citizen engagement), in which citizens are viewed not as voters, volunteer, or

consumers but as problem solvers and co-creators of public goods (Bingham et al. 2005; King and Stivers 1998). Emerson et al. (2012) referred to this reconceptualized form of democracy as "deliberative democracy" which is sought to provide citizens the opportunities to exercise voice and a more responsive, citizen-centered management by embedding "governance systems and institutions with greater levels of transparency, accountability, and legitimacy" (Emerson et al. 2012, p. 6).

In addition to civic engagement, we believe that some elements of the entrepreneurial model, if well-defined and properly implemented, can serve a constitutional democracy. The new paradigm suggests that leaders should be able to strike a balance between stewarding their stakeholders, while being able to act proactively, to think critically, as well as to manage risk and competing values. However, moving toward this new paradigm necessitates the continuous efforts of public administration schools, not only to fortify students of public administration with public ethics and regime values while preparing them for leadership positions in the public service, but also to provide them with the skills needed "to blend high ideals with pragmatic realities" (van Wart (1996).

## Conclusion

To sum up, neither stewardship nor entrepreneurship can be, by itself, a better-fit to a constitutional democracy. A new paradigm of public service leadership was envisioned in this essay, which attempts to reconcile the two models of stewardship and entrepreneurship, suggesting that some elements of both models are needed. Public service leaders, under this paradigm, are not the kind of philosopher kings that Plato imagined could benevolently govern the public good, nor are they expected to act, in all ways, as if they were enlightened philosophers. They are, rather, the kind of leaders that necessity calls forth – leaders who are accountable toward the public in whose name they govern, while capable of adapting, adjusting, and coping with the ever-changing reality.

## Public Service Motivation

Bram Steijn
Department of Public Administration and Sociology, Erasmus University Rotterdam, Rotterdam, The Netherlands

### Synonyms

Altruism; Ethic of human caring; Prosocial motivation; PSM; Public service ethic (By the way, these concepts are closely related, but to what extent they are synonyms is debated within the literature)

### Definition

There are several definitions in the field, but the most widely used is the classic definition of Perry and Wise (1990: 368): "*motives grounded primarily or uniquely in public institutions and organizations*." Another classic definition (although actually of the related concept of public service ethic) is by Brewer and Selden (1998: 417): "*the motivational force that induces individuals to perform meaningful public service*." However, probably the most widely used definition has been developed by Vandenabeele (2007: 547): "*belief, values and attitudes that go beyond self-interest and organizational interest, that concern the interest of a larger political entity*"

### Introduction

Public Service Motivation or PSM has in recent decades become a very popular concept within public administration. Although similar concepts (such as for instance public service ethos) have been used earlier in the literature, the article of Perry and Wise (1990) can be seen as the starting point of the contemporary popularity of the concept. This popularity is illustrated in a 2016 review by Ritz et al. (2016) which identified within the 1990–2014 period 323 academic articles in the English language. Of these only 29 were published between 1990 and 2005, whereas no less than 76 were published in 2014. Moreover, on almost every Public Administration conference special sessions attracting many researchers are devoted to the subject.

This popularity partly explains why precise definitions and understandings of the concept differ as authors sometimes have slightly different views on the concept. However, most authors will see PSM as a motivational construct, e.g., a force that energizes, directs, and sustains behavior: people do something because they are motivated to do so. This is true for sport (you have to train to become better), education (you have to study to pass the exam), and work (you have to do something at the workplace to perform). In this respect understanding of the drivers of human behavior will differ. Some will argue that people will primarily act based on self-interest, which is a basic assumption within economics. However, others point out that people will (also?) go in their actions beyond their self-interest and for instance want to help other people or want to contribute to society.

The concept of PSM is related to the latter belief. The assumption is that this is especially true for people working in the public sphere. Public sector workers (civil servants, but also teachers, nurses, child welfare workers) go beyond their own self-interest, because they want to contribute to society and do "something good." Put simply, you cannot be a teacher if you hate children. You want to learn them something. If this is not the case, you will most probably leave the teaching profession.

This does not imply that PSM only exists within the public sector. Certainly, also private sector workers can be motivated to do something for others. However, research shows that PSM levels are higher among public sector workers

compared to private sector workers. Moreover, private sector workers with higher PSM are more inclined to look for a public sector job than those with a lower PSM.

It must be further noted that PSM certainly is not the only driver of the behavior of public sector workers. In the first place, levels of PSM of these workers differ: some have a high PSM, others have a low PSM. In the second place, PSM is not the only thing motivating them. More classic motivators – like money, career chances, job security, having a challenging job or a good work-life balance – are certainly also important. In fact, the question how important PSM is as a driver of employee behavior compared to those other drivers is a very relevant question.

The literature on PSM has become so huge that this introduction to the theme will be by definition not give full justice. However, several main themes will be discussed. In the first place several dimensions of the concept and their measurement, next the antecedents of PSM followed by its possible effects. This overview ends with some final remarks.

## PSM Dimensions and Measurement

An important topic within the literature is to what extend the PSM concept consists of various dimensions (or "aspects") with a distinct meaning. In a classic article, Perry (1996) discerned four separate dimensions of PSM: (1) attraction to public policy making; (2) commitment to the public interest; (3) compassion; and (4) self-sacrifice. It must be noted that these four dimensions are based on the idea expressed by Perry and Wise (1990) that human (or employee) behavior is based on three common motives (affective, normative, and rational) which could be realized in public service. Thus, public service motivation is not only driven by affective feelings but also by normative feelings ("duty") and rational considerations ("I can influence public policy in a direction I want").

The meaning of the first two dimensions of Perry is probably straightforward. The third one (compassion) refers to the idea that public sector workers feel emotionally attached to civilians or clients which should be protected (Perry uses the concept of "patriotism of benevolence" here). Self-sacrifice is defined by Perry (1996) as "the willingness to substitute service to others for tangible personal rewards." He refers in this respect to former US president Kennedy's statement "Ask not what your country can do for you; ask what you can do for your country" as a classic example of what self-sacrifice is about.

These four dimensions are often used in research and an important question is whether or not the effect of each of these dimensions on various possible outcomes (such as job satisfaction or performance – see below) is similar. Mostly this is not the case, and each dimension could have distinct and varying effects on these outcomes. However, sometimes the existence of these four dimensions is questioned, and several authors have suggested other dimensions or changed or omitted one of the original ones. One of the arguments is that in some contexts, a certain dimension does not make much sense. For instance, Kim (2009) argued that the "attraction to public policy making" is less valid in the Korean context. One can also wonder whether this same dimension is valid within all institutional contexts. Public policy making is very relevant for civil servants (because that is what they do), but much less for teachers and nurses who want to teach children or cure patients. Usually, they do not want to contribute to public policy. For them compassion and self-sacrifice seem therefore more relevant dimensions of PSM.

PSM is often used in quantitative research and in this respect precise measurement is important. Perry (1996) developed an often-used 24-item scale to measure it. Although this measurement is often used, others have tried to improve it. The revised measurement scale of Kim (2009) for instance consists of 12 items and there is also a revised measurement scale by Kim et al. (2013) of 16 items.

However, one of the problems a researcher can encounter is that his or her survey simply does not have room for 12, 16, or 24 items. Therefore researchers also use shortened or global measures. Although less nuanced, this has for instance the advantage that one could include a quick

measurement of PSM in a questionnaire that also includes a lot of other topics. Wright et al. (2013) found in this respect that a five item measurement of PSM (the so called MSPB scale) gives in essence the same results as more extended (but also more limited) measurement scales. The next table provides the five items they used. The answer categories should be Likert scales (thus measuring the extend of (dis)agreement).

### Global Measure of PSM (MPSB Scale) as Used by Wright et al. (2013)

| |
|---|
| Meaningful public service is very important to me. |
| I am often reminded by daily events about how dependent we are on one another. |
| Making a difference in society means more to me than personal achievements. |
| I am prepared to make enormous sacrifices for the good of society. |
| I am not afraid to go to bat for the rights of others even if it means I will be ridiculed. |

## Antecedents of PSM

An important research question is whether or not one can influence the degree of PSM. Perry (1997) discussed in a classic article five possible antecedents (parental socialization, religious socialization, professional identification, political ideology, and individual demographic characteristics). Although he showed that many of these possible antecedents are indeed related to PSM, they are less relevant from a practical viewpoint as they cannot be influenced by the organization. In a later reformulation of his theory, Perry (2000) has stressed the importance of institutions (for instance school or the organization one works for) for the development of PSM.

The idea that PSM is embedded in an institutional context has become a very important one. In this respect, employees work in an organizational environment (with its mission, values, but also organizational incentives and in general the work environment) and this will affect their PSM. However, also the international context is very relevant. Has PSM the same meaning in each country, or are there for instance differences in meaning between the USA, European, and Asian countries? Is the level of PSM similar across countries, or are there in this respect differences between countries? Of course, one can ask the same questions with respect to the various PSM dimensions.

Moynihan and Pandey (2007) were probably one of the first to investigate the effect of organizational antecedents of PSM. This is an important topic because if PSM has positive effects (see next paragraph), organizations will want to affect it to increase these positive effects. In other words, if respondents with higher PSM perform better, an organization wants to increase their PSM. The study of organizational antecedents of PSM therefore has become an important one within the literature, and in more recent studies especially the relation with Human Resource Management or HRM (which human resource practices – like recruitment, training, or rewards – can enhance PSM?) and leadership (which type of leadership style enhances PSM?) has been stressed.

How is PSM linked to the institutional or organizational context? Within the literature an important relation is made between the PSM concept and the so-called person-environment fit literature (Leisink and Steijn 2008). According to this literature, the rather classic concept of person-environment fit can be defined as "the compatibility between an individual and work environment that occurs when their characteristics are well matched" (Kristof-Brown et al. (2005: 281)). This fit can relate to the organization (person-organization fit), the job (person-job fit), the group (person-group fit), or the supervisor (person-supervisor fit). Using the distinction between attraction-selection-attrition, one can explain why levels of PSM of public sector workers are higher compared to private sector workers. People are *attracted* to public sector organizations because they like the mission and values of those organizations ("serving the public"), they are *selected* during the HR process because the selectors feel that the applicants "fit" the organization. However, people will *leave* the organization when they perceive a misfit between

their values and the values of the organization. This could be the result of disappointment between ideal and reality, but also because the organization (or the employee) has changed.

Many studies have in recent years used the person-environment fit framework in relation to PSM as it can explain how organizational value congruence (Perry and Vandenabeele 2008) between the values of the organization and the employee can happen. The framework can thus be used to explain the mechanism linking organization and employee but can also explain how PSM affects various outcome variables.

## Effects of PSM

In the preceding paragraph we have treated PSM as a dependent variable, thus we have discussed some variables (such as HRM or leadership) that can affect the level of PSM. However, within research PSM is more often treated as an independent variable. For instance, researchers study the effect of PSM on employee outcomes like job satisfaction, commitment, turnover intentions, or organizational citizenship behavior (which implies that one goes beyond the formal job description and for instance help colleagues). Typical hypotheses (which are often confirmed) are that a higher PSM is related to a higher job satisfaction, a greater commitment, lower turnover intentions, and higher organizational citizenship behavior. There is also similar research linking PSM to the support of citizenship participation or charitable giving. Also, above we have already shown that PSM is linked to organizational attractiveness: people with higher PSM are more attracted to public organizations.

As described above, the person-environment fit can be used to explain the mechanism linking PSM with employee outcomes. For instance, people with higher PSM feel higher value congruence with the (public) organization they work for and therefore have a higher job satisfaction or a lower turnover intention. This mechanism is rather straightforward and confirmed in several studies (for instance Wright and Pandey 2008).

However, an important caveat has to be made. Steijn (2008) suggested that not so much PSM in itself as well as the PSM-fit is an important predictor of employee outcomes. PSM-fit implies that employees "have to be able to use" their PSM. If their PSM is high, but they are restrained in their possibilities to use it – for instance when their compassion is high but they feel they cannot help citizens or clients – their attitudes like their job satisfaction will be negatively affected.

A similar idea is found within literature suggesting that PSM can have a "dark side." At first sight, one is inclined to think that PSM is a "positive" concept as people with PSM want to do good for society. However, several studies have suggested that this has another side (called "the dark side"). The study of Steijn mentioned above suggests this by pointing out that people with higher PSM can become frustrated because they cannot use this PSM in their work. Similarly, other studies have suggested that PSM can for instance lead to burn-out because PSM motivated people work too hard or overreach themselves in responding to clients (Van Loon et al. 2015). Thus, PSM could also have negative effects on employee outcomes.

In this respect especially studies linking red tape and PSM should be mentioned. There is a huge amount of public administration literature on red tape – or the existence of burdensome rules and regulations, especially in public organizations – and several studies have addressed the relationship between red tape and PSM. Quratulain and Khan (2015) have nicely summarized the discussion about this relationship by pointing out that there are in essence two viewpoints. On one hand, PSM can be seen as a job resource that can help employees to overcome the negative consequences of burdensome rules and regulations. In that case, they can overcome those rules as a consequence of their high PSM. On the other hand, red tape can also be seen as an extra hindrance which prevents employees from achieving the results they want. In that case PSM will have negative effects on employee outcomes as those with higher PSM will feel more frustration. Future studies will tell which of both possible mechanisms is most plausible. Although

probably they both will be true – in some case PSM will be a resource, in other cases (or contexts) it will be a hindrance.

## PSM and Performance

Special attention should be given to the (possible) link of PSM and performance. Already in the seminal publication of Perry and Wise (1990) it was hypothesized that PSM is positively related to performance. In other words, employees with higher PSM are expected to perform better. Again, this relationship could be explained by the person-environment fit perspective as done in the previous paragraph. Many studies have addressed this hypothesis but unfortunately results are mixed. Some studies found support for the expected positive relationship, others do not. Brewer (2008) suggests that this has to do with the fact that measuring performance – especially in the public sector – is a daunting task. What exactly is performance in the public sector (probably not "profit," but what else?)? And how do we measure it? Is a civil servants who writes a lot of policy papers a "good performing" or a "bad performing" civil servant? And what about a teacher who devotes a lot of time to a certain child in his class? How does that affect the other children in his/her class? Van Loon (2015) argues in her dissertation that the relationship between PSM and performance is context dependent. To analyze this relationship one has to realize that (public) performance means different things in various contexts. Therefore one has to include various dimensions of performance in research and one should understand that their relationship with PSM could depend on the sector. For instance, pass rates on exams could be related to PSM on secondary school but not on universities (where research output is more relevant as performance indicator). According to Van Loon (2015) it can also be expected that not all performance indicators will be related to PSM but especially those that are related to the safeguarding of public values (such as equal treatment, impact on society and transparency).

## Conclusion

Public service motivation has become an important subject within the public administration literature, and the number of publications devoted to it is increasing each year. This entry is by definition limited as so many research questions can be asked. The popularity of the concept probably has to do with its positive meaning "of doing good for society." PSM has become a concept that appears to be central to the public administration field. At the same time it must be noted that similar concepts have been used in other fields – for instance "prosocial motivation" within organizational and management studies and "ethic of human caring" within nursing.

Notwithstanding the huge amount of literature, there still remain many questions that have to be answered. These for instance relate to the context (how exactly does context affect PSM?), the positive and/or dark side of PSM, the exact nature of the relationship between PSM and performance, and the relative importance of PSM compared to other drivers of (employee) motivation. For instance, Is PSM more important as a driver of employee behavior than money? Or probably more exactly, under what conditions is PSM more important? Thus, research on PSM is blossoming but still many avenues for further research could be taken (see also Perry et al. 2010).

# Public Service Motivation and Employee Engagement in Bureaucratic Organizations

Juanita M. Woods[1], Donna Cooke[2] and Katarina K. Brant[2]
[1]Mike Cottrell College of Business, University of North Georgia, Oakwood, GA, USA
[2]College of Business, Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Bureaucracy; Engagement; Human resource management; Job challenges; Job demands; Job demands-resources framework; Job hindrances; Job resources; Motivation; Public administration; Public service; Red tape

## Definition

Public service motivation is a predisposition to behave altruistically when performing job duties. It has been studied in the private and public sectors. Employee engagement, a motivational concept, is a combination of attitudes and behaviors where employees demonstrate dedication and absorption in their work. Red tape is the perception that organizational policies and practices are hindrances to one's job and interfere with one's work. Red tape can reduce a public sector employee's engagement in their job, unless they also have high levels of public service motivation.

## Introduction

Public sector organizations typify bureaucracy by having specialized work roles, a detailed system of rules, a hierarchy of authority, and impersonal decision-making. Policies and procedures, protocols, and impartiality in processes regarding employment and procurement are viewed as necessary to avoid corruption and to engender trust in public institutions. However, a bureaucracy's ultimate goal is efficiency (Blau 1956). Enacted rules and procedures may create unnecessary hindrances such as red tape for employees and can undermine the goal of efficiency. Red tape is distinct from formalization (Brewer et al. 2012). Whereas formalization can serve a useful purpose, red tape is by its nature an unwanted stressor, hampers goal achievement, and leads to failure (Bozeman 2012). In essence, no good comes from red tape. Therefore, when employees perceive red tape, this may dampen their enthusiasm for their work and suppress positive work behaviors (Blau 1956).

Public sector managers are confronted directly by red tape in their administrative roles, such as when they must navigate human resource and procurement requirements. These managers are also indirectly obstructed whenever they manage or interact with others who perceive red tape. Organizational red tape is defined as the organization's (unnecessary) burden to comply with the rules, and stakeholder red tape is that perceived burden from the point of view of the stakeholder (Bozeman 2012; Altunok 2018). The stakeholder could be internal to the organization or external, such as a contractor or client.

Scholars have been trying to understand better the nature and consequences of red tape and to provide managerial insights regarding how those who are unable to avoid red tape handle those negative consequences. A review of empirical studies reveals that the approaches to operationalizing perceived red tape have changed over time. Pandey and Scott (2002) developed an organizational red tape measure with functional foci: human resources, procurement, budgetary, information systems, and communication. They found information systems red tape significantly affected organizational performance, human resources less so despite emerging as a key complaint in interviews, and the others demonstrated no effect. Pandey and Scott (2002) conjectured that the informant's involvement in various duties might have heightened the salience of certain red tape types. This explanation is suggestive of stakeholder red tape. Others have developed measures of the stakeholder approach to red tape (Brewer and Walker 2009; Feeney and Bozeman 2009). Although studies have been conducted using measures of organizational red tape and stakeholder red tape, ones on the former are more common. Then in 2012, Bozeman advanced a new construct – multidimensional red tape – which accounts for the costs of compliance versus the benefits of the requirements to the stakeholders' goals. This approach combines aspects of organizational and stakeholder red tape. Pandey and Marlowe (2015) and Van Loon et al. (2016) developed different methodologies for measuring multidimensional red tape. Pandey and Marlowe (2015) employed vignettes which varied in level of red tape as judged by experts. Respondents rated the red tape they perceived in the vignettes and completed the red tape survey regarding their organizations. Their responses to the survey were adjusted based on how the respondents perceived the red tape in the vignettes vis-à-vis the experts. Van Loon et al.'s (2016) approach was to have respondents rate the compliance burden and the functionality of rules for different processes. Those rules with high burden and low functionality are red tape. Both of these novel approaches to measuring multidimensional red tape seek to bring the focus to only those rules which do not yield the intended outcomes while creating additional encumbrances. Unfortunately, both methods are likely to reduce response rates due to the demands they place on respondents. As of now, other studies have not employed either approach.

One theoretical framework that is compatible with the costs and benefits concept for red tape is the job demands-resources model (JD-R). Job demands are the physical and psychological aspects of the job which employees must exert effort in order to meet. Demands are further

distinguished as challenges or hindrances (Crawford et al. 2010). Employees perceive challenges as circumstances to overcome, while they see hindrances as frustrating and exhausting. Job resources are personal and job-related means (e.g., competence, effective job design, and supportive leadership) that can be utilized to meet demands. Both job demands and job resources influence employee attitudes and behaviors.

## Employee Engagement

An important employee attitude that may be influenced by red tape is work engagement. Work engagement, a multifaceted construct, occurs when employees demonstrate a positive work attitude by becoming engrossed in their job and feeling proud about the work that they do (Schaufeli 2012). Employees who are engaged in their work demonstrate positive attitudes about their job and their workplace and put forth additional effort toward working effectively and within the organizational guidelines. Research on work engagement has shown positive relationships with many important and desirable employee attitudes and behaviors, such as organizational commitment, extra-role behaviors, improved job performance, initiative, and a learning orientation (Schaufeli 2012; Steijn 2018). Because of its mediating role between work conditions and resources (e.g., task, personal, role, environmental) and well-researched attitudes and behaviors, work engagement has emerged as an important construct in the organizational literature. Interest in work engagement is worldwide, evidenced by numerous studies particularly in Europe, the United States, and Asia.

Research on work engagement also uses the JD-R model as the theoretical basis (Bailey et al. 2017). In the model, job resources (e.g., job security, a supportive social environment, participation in decision-making, autonomy) contribute to work engagement by providing conditions that motivate employees to do their job well. Challenges stimulate motivation and have been shown to be positively related to work engagement. When faced with a challenge, an employee is energized to overcome it. Hindrances, on the other hand, are demotivating and have an opposite effect on work engagement. They cause employees to feel frustrated and discouraged. Research on antecedents of work engagement confirms positive relationships with job-related resources and personal characteristics (e.g., supervisor support, feedback, self-efficacy, psychological empowerment, situational motivation) and job challenges and negative relationships with hindering job demands and dysfunctional work environments (Bailey et al. 2017; Crawford et al. 2010).

## Public Service Motivation

An important job-related resource in the public sector is public service motivation. Public service motivation is the "individual's predisposition to respond to motives grounded primarily or uniquely in public institutions and organizations" (Perry and Wise 1990, p. 368). Public service motivation is a motive to serve or to act altruistically to help others (Anderfuhren-Biget et al. 2010). Public service requires a certain mindset of individuals to allow them to work within the often bureaucratic work systems found in public administration organizations. Outcomes of public service motivation are varied and widely studied and include job satisfaction, organizational and job commitment, and employee performance (Ritz et al. 2016). Public service motivation has also demonstrated relationships with work engagement in the public sector.

A recent article considers how public service motivation may interact with perceptions of red tape to reduce the negative effects of red tape perceptions on work engagement in the public sector (Cooke et al. 2018). Cooke et al. (2018) were the first to investigate the joint effects of public service motivation, demands, and a challenge on employee work engagement in a test of the JD-R model. In previous research, resources, challenges, and demands were not studied simultaneously concerning their effects on work engagement. In this study, Cooke et al. (2018) developed and tested two competing sets of hypotheses. In the first set of hypotheses, public

service motivation was conceptualized as an antecedent to work engagement. The model included one challenging job demand which was perceived job influence or discretion. Perceived job influence is a challenge and not a hindrance because it leads to greater competence. The two hindrances in the model were perceived procurement red tape and perceived human resource red tape. Thus, Cooke et al. (2018) hypothesized that public service motivation and perceived job influence would positively relate to work engagement and perceptions of human resource red tape and purchasing red tape would be negatively related to employee engagement.

In the rival set of hypotheses, public service motivation was conceptualized as a moderator and proposed to have a buffering effect on the hindrances as they relate to employee work engagement. Cooke et al. (2018) extended Bakker's (2015) proposals from daily work engagement to employee work engagement by proposing that when employees perceive red tape, those with higher public service motivation will remain more engaged than those with lower public service motivation. In other words, public service motivation would negatively moderate the negative relationship between perceived human resource and procurement red tape and work engagement. The logic here is that employees with higher public service motivation are more interested in behaving altruistically. Employee encounters with red tape would be viewed as relatively minor in the context of the greater meaning of their work. Because perceived job influence is a challenge, it is expected to have a positive effect on employee work engagement, and public service motivation would not have a buffering effect on this relationship. Therefore, Cooke et al. (2018) proposed that public service motivation would not moderate the relationship between perceived job influence and work engagement.

Using structural equation modeling (SEM) to test a sample of 388 managers from a large public sector organization in the southeastern United States, Cooke et al. (2018) found empirical support for the first set of hypotheses with public service motivation as an antecedent. Cooke et al. (2018) found that public service motivation helped to offset the negative effect of perceived procurement red tape (but not human resource red tape) on employee work engagement. In other words, public service motivation as a resource leads to higher levels of employee engagement and reduces the demands of procurement red tape on employee engagement. There was not as much support for the second model with public service motivation acting to moderate the effects of perceived red tape on work engagement.

## Implications for Practice

Although bureaucratic organizations utilize procurement rules and procedures to avoid corruption, waste, and to achieve efficiencies, when those processes create unwanted red tape, this can undermine employees' work engagement. However, managers in the public sector who are otherwise powerless to eliminate red tape can take steps to foster public service motivation and mitigate the potentially negative effects of bureaucratic structure and red tape on employee engagement. Practices around recruitment and selection, motivation and development, and promotion and retention can be enacted to build employee motivation to work in the public sector even with perceived challenges to their job.

In the area of recruitment and selection, public sector managers can screen for and hire individuals who are predisposed to public service motivation. By bringing employees with a mindset that supports work in the public service, managers can build a workforce that may be less likely to see bureaucratic policies and procedures as burdensome and a hindrance to their job. Organizational HR practices around recruiting and selecting employees with high levels of public service motivation may include promoting the mission of the organization as one focused on the public good or screening candidates with internal motivations that may conflict with the motivation to serve in the public interest (Christensen et al. 2017).

Another area that managers can focus on is to build a positive work climate that supports work

engagement. Public sector managers can make it a priority to cultivate work environments that sustain high levels of public service motivation by keeping their mission to help the public at the forefront of all that they do, frequently reminding their employees of the greater good that they are doing, and reminding employees to keep their individual motives at bay. Moreover, when managers lead by example by putting the public first and hire others who do the same, this motivation can be contagious throughout their team, department, and organization.

In addition to fostering a strong culture of public service motivation, public sector managers can lessen the detrimental effects of red tape on employee work engagement by rewarding and retaining employees who demonstrate high levels of public service motivation. Managers can build a sense of autonomy and purpose in the daily work of public service employees. Another approach might be to implement mentoring opportunities for senior members to support protégé development of a public service mindset or providing strategies for handling work stressors that may reduce the motivation to serve in the public sector (Christensen et al. 2017).

## Conclusion

Work in the public sector is commonly characterized as policy and procedure-driven work with a focus on efficiency and impersonal treatment of constituents. The focus on efficiency through bureaucracy may dampen employee morale and performance by fostering a perception of red tape that inhibits work engagement. While managers in the public sector cannot eliminate the policies and procedures that contribute to reduced employee morale, they can create a work environment where employees are motivated to perform and contribute at a high level regardless of the perceptions of such job hindrances. Developing a strong sense of public service motivation through HR policies and practices around recruitment, selection, and development, managers may reduce the potential negative effects of perceptions of red tape on employee work engagement.

## Public Service Motivation and Nonprofit Organizations

Palina Prysmakova
School of Public Administration, Florida Atlantic University, Boca Raton, FL, USA

### Synonyms

Attraction to meaningful public service; Prosocial motivation

### Definition

Public Service Motivation is a multidimensional motivational concept that appears in the public service human resources vocabulary. It is briefly defined as one's inclination to serve towards public benefit and wellbeing of others.

Public Service Motivation (PSM) is a homegrown concept of the public administration literature. When it first emerged in the 1990s, it was believed that this individual motivation to work towards public benefit was an exceptional attribute of the public sector employees (Perry 1996). However, as the time has passed, and more studies took place in various administrative and managerial environments, it became clear that PSM is a more comprehensive and more inclusive concept. This individual inclination to do one's best to serve the public interest is equally important for private nonprofit organizations. Like public sector organizations, the nonprofit ones are interested to hire and maintain employees who deliver services while keeping the wellbeing of others in their minds. The public service rather than the public sector became the stem that holds the various definitions of PSM together.

So far, what we know about one's PSM is rather subjective because this knowledge is based on what we heard. The importance, which a person assigns to the provision of meaningful public service, often has been assessed as a self-declaration. Employees have been asked to report on their levels of compassion, self-sacrifice, attraction to public service and policy making, and commitment to public values (Perry 1996). Those self-reported values were afterwards associated with various organizational and individual characteristics and outcomes.

This entry covers three areas where an individual PSM connects to the world of the nonprofit organizations. The first section develops this introduction further as it reviews what we know about the levels of PSM of nonprofit sector employees. It describes an individual profile of a nonprofit employee using PSM as one of the motivational characteristics. The second section of this entry explains how imperative this concept is for such newly emerging organizational forms as social enterprises. The third section investigates which sociopolitical organizations become of interest to the people with high PSM and why, regardless of the sector of their employment. This section answers the question why any public service motivated individual would get involved in often unpaid sociopolitical activities, from signing a petition to attending a mass in a church. Most of such activities are either run by formal nonprofit organizations or by some grassroots groups. Thus, this section is interested in the manifestations of PSM in the nonprofit environments, other than those related to one's formal place of employment.

## PSM and Employment in Nonprofit Organizations

The institutional theory is a useful instrument to explain why PSM levels vary across different sectors of economy. It suggests that individuals, their attitudes, motivations, and behaviors are mostly shaped by their normative surroundings, like the accepted rules, customs, and patterns of conduct. You can think of them as the rules of the game in a society. From the perspectives of this theory, PSM adapts to the institutional situations, read to the set of rules, of a given organizational form whether it is a county property appraisal office, a soup kitchen down the street, or an international environmentalist group.

So, what would be the rules and the values of nonprofit organizations that can resonate with individual PSM of their employees? Like public organizations, and in contrast to private businesses, the nonprofits aim to satisfy public needs, rather than to maximize their financial capitals (Word and Park 2015). The decades of cross-sectoral comparative research confirmed that indeed public and nonprofit employees have different motivations and rewards expectations than their private sector counterparts, because of their obligation to work for the public interest (Ritz et al. 2016).

Meanwhile, more evidence was occurring that further suggested that the intrinsic motivation of nonprofit employees also differs from that of the public sector workers. A closer look at PSM as a form of intrinsic motivation, showed that this individual motivational characteristic follows these general observations.

Scholars often refer to the logic of appropriateness to explain the sectoral differences of PSM. They pose that public and nonprofit employees are bounded by the different sets of rules that are rightful and expected to be followed in their organizations. For example, the employees of public organizations are pushed to prioritize the choice of the majority, while the nonprofits respond primarily to the needs of their focus groups. In their turn, public employees are prone to stress and burn-out because they are overwhelmed by the responsibility to address all social issues simultaneously. Clearly defined priorities of the nonprofit organizations narrow the professional experience required from nonprofit job candidates, making nonprofit employees more specialized than the public sector employees.

Another example of the organizational differences that may affect employees' PSM levels is the extent of oversight and the detalization of imposed procedures in the public sector. Public employees abide to the complex government regulations, which in addition to the expectations of outcome, also regulate their pay, promotion, personal development, and discipline. Thus, another good reason for different levels of PSM is a better flexibility of nonprofit structures, where employees have more freedom to devote their time and attention to provide service instead of wasting some, if not all, of their valuable time on the resistance to administrative pressures and coping with bureaucratic red tape. The list of other factors that can cause the differences in individual PSM include the perceived images of the sectors by general public, fund-dependency of the nonprofit sector on donors, and better social protection of public sector employees (e.g., benefits or job security).

The differences of the work environments between the sectors suggest that despite some challenges, the nonprofit motivational climate should be more favorable for public service motivated individuals than that of the public sector (Word and Park 2015). The research on PSM that tests this proposition remains rather sparse, so that we cannot state with a strong assurance that that is indeed the case. Also, a separate attention should be paid to the fact that nonprofit organizational forms and structures are more diverse than the public ones, meaning that not all types of nonprofits will attract similarly motivated individuals.

## PSM and New Not-for-profit Organizational Forms

A social enterprise became a new form of handling business with a strong societal dimension in

its operations. These new organizations continuously show their ability to make a positive change in society without or with minimal reliance on external donations and grants. Thus, while being public service oriented, such organizations often contribute to public treasuries by paying taxes on their goods and services, instead of asking for the monetary support from these public depositories. Is PSM an equally important motivational characteristic of social enterprise employees as it is for the classic nonprofit workforce? Isn't it that the financial proficiency is at the core of a social enterprise success instead?

The question remains whether a public-service- or business-oriented portfolio of a venture creator is the best suited to guarantee the successful launch and survival of these new organizational forms. In addition, it would be useful to know how external actors that are interested to support the growth of social enterprises can assure that more of these particular organizational forms have been opening around. For instance, is it possible to educate a person into being more entrepreneurial and business oriented, while preserving or cultivating their public service motivation and their respect for a mission that addresses a societal need?

Social enterprises are known for their tensions between these conflicting logics. Because any social enterprise has a mission at the core of its operations, it seems logical to expect that those who want to launch such a business will possess at least some PSM virtues. Many studies confirmed that personal motivations are often the main reason when people think about opening a social enterprise. Contrary, a private business always emphasizes a multiplication of the assets of its investors.

These personal motivations often depend on individual identities of new venture creators. The personalities of entrepreneurs define the trajectories of the venture process and its further organizational development. The founding conditions always have enduring consequences for social enterprise ventures. Depending on the personality of a founder, the organization will incline either towards commercial or towards social logic. Thus, if a person is deeply public service motivated, we can expect that her social enterprise start-up will lean towards putting its social mission first. If the founder is more like a numbers guy, with only some public service motives at hand, it would be easier for him to build his start-up around a sound budget plan.

In some rare and unique cases, a founder engages in an energy-consuming creative process to balance and merge the two conflicting logics. Such social enterprises usually become world-known and often serve as best practice examples. However, most of the time the founders do not have necessary time and monetary resources to experiment, and when faced with the challenges to combine a social mission with the profit maximization either attempt to change the overall institutional climate by lobbying and advocating about the cause, or simply abandon an opportunity and, thus, liquidate the start-up (Wry and York 2017).

Unarguably, PSM is a desired motivational quality for social enterprise leaders. Yet, can we improve one's PSM level so that we can foster the success of a new social enterprise start-up? Social enterprise scholars say that opportunity development training can stimulate one's motivation if and when the feedback received during such training corresponds to the entrepreneurs' identities. If the feedback repeats what an entrepreneur already thinks, the training reassures the selected course of action, and helps the project to take off. For example, if a person is originally pro-socially oriented and wants to open a social enterprise to make a change, further learning about PSM and how it enhances social enterprise operations will encourage this person to work further on her start-up. In case when feedback clashes with the identity, it results in a cognitive dissonance. For instance, it happens when a public-service-motivated person gets feedback that her project is a dream that is disconnected from the financial realities, or when a business-oriented person is charged for forgetting to put the interest of her clients before the profits. The created cognitive dissonance leads to either putting the start-up on hold for the search of better solutions (this is a desirable but rarer outcome), or to the abandonment of the venture creation at all. The latter unfortunately happens more often (Wry and

York 2017). Thus, we can conclude that while any professional training aims to be beneficial for its constituency, we need to be careful in matching individual personalities with whether PSM knowledge may be used as the main inspirational line that will indeed encourage social enterprise venture creators rather than discourage them.

## PSM and Socio-Political Activism

The increasing popularity of civil society ideas caused a growth in studies about the relationship between different forms of civic participation and PSM. Scholars have linked PSM to various activities valued by society including volunteering and donating, and political and social activism. Indeed, public service providing organizations and sociopolitical organizations can share values that encourage some behaviors and feelings like self-sacrifice, compassion, attraction to public service, and commitment to public interest (Perry 1996).

Scholars have been looking for some common lines between PSM and sociopolitical activism, suggesting that public service providing organizations and, therefore, their employees, should constitute an organizational field that has some stable associations with other socio-political institutions. In the early 1980s, famous American educators and professors Paul DiMaggio and Walter W. Powell defined an organizational field as one gathered around a common service or product, which for PSM studies often would be public service and public service provision. While, indeed, we observed some similarities in some cases, largely, the efforts to find a common pattern between public service motivated individuals and their involvement in sociopolitical organizations led to ambiguous results. Seemingly similar organizations that provide same services to the same populations would often be in the situations where they praise and cultivate different public values. Thus, the scholars did not offer a clear answer on whether a highly public service motivated individual exhibits a predictable pattern of volunteering, church-going, or activism in political parties, labor unions and professional organizations (Ritz et al. 2016).

While there is often a precedent of value sharing at the organizational level, the profile of public service motivated individuals barely has a universal sequence of associated sociopolitical activities, that would equally fit any person around the globe. In other words, a similarly public service motivated person may be a keen blood donor or an active environmentalist or a frequent church-goer, or never develop any of such interests. Why so? Isn't it that those who share similar drive to help others through the means of public service should have similar values and interests? Apparently, the answer is no.

The main reason behind is that seemingly similar organizations, e.g., volunteering groups across the different countries, will emphasize the different sets of values, depending on which country, read institutional environment, these organizations are located in (Vandenabeele and Van de Walle 2008). The overall institutional contexts create unique situations when even different sociopolitical organizations may have similar socializing effects: for instance, to go to church in one context may correspond to the same values as to be a member of a political party in another. From value perspective, in one context, political parties and nonprofit organizations might have even more public serving values in common, than public and nonprofit organizations that provide similar services to the same population. In other contexts, public serving organizations would share institutional values with labor unions or spiritual groups (Prysmakova 2019). These propositions, also known as organizational field postulates, illuminate the importance of historical context when institutional and cultural peculiarities determine the level of public service motivation.

Let's illustrate the theoretical propositions described above with some real-life examples of PSM relationships with sociopolitical activities. Note, that none of them are universal. Thus, while being present in one group of societies, they can be nonexistent or even reverse in others.

*Political Participation*. Some Australian studies showed that public service motivated employees often indirectly participate in politics like signing petitions or approaching politicians

(Taylor 2010). Yet, we cannot say that all highly public service motivated individuals are willing to be the members of a political party of some sort. We should keep in mind that belonging to a political party by voluntary choice is different from ad-hoc political activism, because a party membership assumes internalization of at least some of its institutional identities and beliefs. Often, public service motivation connects to the values of the left-oriented parties. At the same time, even within the same country but across different departments of similar agencies, the associations of PSM with political activism can differ: one study of Swiss municipalities showed reduced commitment to public interest with hours spent on party activities, while another demonstrated its increase with more frequent participation in political actions (Prysmakova 2019).

*Religious and Spiritual Practices.* Studying religious practices is one of the good ways to learn about acceptable behaviors in each society. For that reason, the researchers of PSM have been paying a particular attention to the spiritual activities looking into how they can shape one's system of values affecting their desires to self-sacrifice, to be compassionate, attracted to public service or committed to public values. Their main argument was that religion often fosters public service values. Indeed, some examples showed higher levels of self-sacrifice for Christian Catholics and Protestants, because such a behavior is promoted by their faiths (Vandenabeele and Van de Walle 2008). In other words, these churches advocate that self-sacrifice is the most appropriate behavior. Meanwhile, the connection between the religion and other PSM dimensions is not that obvious. For many reasons, the attraction to public service or commitment to public values is often lower for those more frequent churchgoers.

*Volunteering*. Volunteering is an action of selfless contribution towards the benefit of others. Thus, its definition resembles a lot the one of PSM. The question remains what comes first: is being more public service motivated pushes people to donate their time and effort more frequently, or it is the volunteering process that opens one's mind to the meaningfulness of public service? There has been no straightforward answer. While most of the time, volunteering and PSM are indeed strongly and positively connected to each other, in the cases of some societies, especially post-soviet ones, higher levels of PSM can mean reduction in volunteering strives. In those cases, volunteering continuously reminds of some compulsory activities as required by an employer or an educator. Forced volunteering as any other forced activity can have a negative effect on one's desire to contribute to the wellbeing of society (Prysmakova 2019).

*Professional Organizations.* Professional organizations are indispensable articulators of the diverse values of different professions. They are very helpful for its members to understand and internalize the norms and values of their vocations. In other words, professional organizations are great socialization places. Yet, even though we often think of professionalism as a virtue that assumes some degrees of ethics, it does not have to be always the case. Also, each profession can have its own definition of what constitutes an ethical behavior. For instance, not all professions and, therefore, not all professional groups will equally praise compassion, or protection of the wellbeing of others at one's own cost. In some professions, high levels of compassion can be even seen as harmful as they can block a person from taking a necessary immediate decision or action. To sum up, while we see more evidence that membership in professional organizations connects to public service motivation, different professional organizations would either emphasize or diminish the role of some PSM elements.

*Labor Unions.* While labor unions often operate with such vocabulary as public service and wellbeing of others, it is widely known that unionism is also a manifestation of self-interested and self-protection behavior. Even though they are the public sector employees who are more likely than employees of other sectors to be unionized, the unionization options become more and more available for the employees of private businesses and private nonprofit corporations. What it means

for a public service motivated person to join a union, and whether those who join are stronger public service motivated remains a great question to discover.

Remember, that the associations of PSM with the sociopolitical activism as discussed above can be true for one society and will never happen in another. In other words, in one part of the world, public service motivated individuals eagerly unite in political parties as they see them the means to conduct meaningful public service, while in the other part of the world, political parties attract only corrupted and selfish individuals. Why would attributes of meaning differ between organizations that have been originally created as those aiming to help society and create a better world? Because of differences in ideologies and in the values emphasized by these ideologies, that are considered legitimate in a particular institutional context. Institutional theorists say that legitimacy is crucial for the ruling norms, habits, and traditions to emerge and to survive. What an organization does or can do is tied to the ideologies of the society which give this organization its legitimacy. As ideology can change, so will the legitimacy of organizational actions, norms, or values, because a change in ideology always means a change in existing institutions.

Let's consider an example. In one country, an ideology of a church is legitimized by a public authority. In other words, in that society the government officially supports this church and its values as the ones that lead to the betterment of society. In this case, we will find a lot of similarities between the values that are promoted by that church and within the public sector, e.g., higher levels of self-sacrifice. We observe a value convergence, because the church and public organizations share similar norms, values, and guiding principles. And now consider an opposite case where the public authorities promote the secularity of society and, therefore, legitimize the secular way of life and behavior. While the church continues to promote self-sacrificing and compassionate attitudes and behaviors, the public service organizations may instead emphasize such virtues as individualism, autonomy, and empowerment, and promote emotional labor practices to mitigate a public display of emotional compassion. While in both cases, public sector employees will be public service motivated, their levels of PSM will be high because of the different reasons. In the first case, it would be due to the internalized desire to self-sacrifice, for example, working long hours to guarantee that all citizens that made it to the office that day were served. In the second case, we will talk about one's strong attraction to public service that can manifest in one's keen interest to launch a new social program or to contribute to the activities of a local community.

## Conclusion

This encyclopedia entry was devoted to Public Service Motivation (PSM) as one of the fast-spreading motivational concepts in the nonprofit human resources vocabulary. PSM was briefly defined as one's inclination to serve towards the public benefit and the wellbeing of others. We learned that PSM includes various subdimensions like self-sacrifice, compassion, attraction to public service and commitment to public values.

This entry further provided a summary of the three main instances, when the theme of PSM occurs in the nonprofit management world. First, we talked about PSM as a desirable characteristic of the employees and volunteers of a nonprofit organization. Second, the entry referred to the role of PSM in the new not-for-profit organizational forms that become popular around the world today. Namely, we discussed the relevance of this concept to the conflicting logic of social enterprises, which are combining social mission orientation with earned income strategies. This section concluded that PSM as a founder's virtue can be good for social enterprises, while it also questioned whether it can be obtained by the means of professional training. The third instance when people refer to PSM in the nonprofit context is when they discuss sociopolitical activism. The

relationships between such activities and PSM are complex, because seemingly similar actions for instance, volunteering, can promote different values in different societies. Whether or not these sociopolitical activities align with individual PSM, and if yes, along which dimensions of PSM, depends on the ideology that currently dominates in each society.

# Public Service Motivation and Psychological Ownership in Taiwan

Kuo-Tai Cheng
Department of Environmental and Cultural Resources, National Tsing Hua University, Hsin-Chu, Taiwan

## Synonyms

Human resource; Motivation

Public service motivation (PSM) is necessary for public employees in government-owned enterprises (GOEs) to be successful in serving the public and eventually help with their jobs or careers. Relatively little research has been carried out with regard to the role of PSM in the GOEs. Poor human management, at the government and enterprise levels, continues to present a significant problem to many firms, even after changing ownership and introducing competition. Some studies address this issue from a corporate governance perspective, but here the management of GOE seems to require a broader dimension other than that covered by corporate governance. In the face of such a rapidly changing economic reform situation, which is often unique and different from other countries, researchers have had difficulty staying up to date with the pace of transformation of Taiwan's economy, including the transformation of GOEs. However, previous ownership studies have focused primarily on physical objects such as public ownership of GOEs, whereas almost no research has been conducted on the psychological ownership (PO) toward public entities. This research will also provide insights into the complicated nature of the interactions between GOEs' transformation and human resource management.

## Introduction

It is often asserted that, besides structural reforms and physical ownership, a blend of public service

motivation (PSM) is necessary for public employees in government-owned enterprises (GOEs) to be successful in serving the public and eventually help with their jobs or careers. Recent research has demonstrated that PSM is composed of multiple dimensions (Kim et al. 2013; Wright 2008) and is expected to improve the performance in public organizations (Brewer and Selden 1998; Perry and Wise 1990; Walker et al. 2010). As Perry and Wise (1990) argued in 1990, PSM is positively related to individual performance. They stated that public tasks would be intrinsically motivating for employees with high PSM because they would embrace work with attributes such as high task significance (Perry and Wise 1990, p. 371).

In the last two decades, a significant change has taken place in many previously GOEs, as they have moved toward more market orientation. Consequently, the transformation of GOEs from government to market, primarily through privatization, has seen this trend culminating in a worldwide change (Cook and Kirkpatick 2000; Shirley 1999). In particular, the global debate over the mechanisms for transforming GOEs to private enterprises remains open on the question of ownership change, the introduction of competition, and management reform. Some advocates for transition in ownership change through privatization (Shirley 1999; Shirley and Walsh 2000). Some emphasize the creation of competition (Cook and Kirkpatick 2000; Yarrow 1986). Some stress management reform, including the perfection of market-supporting institutions (Kolodko 1999; Stiglitz 2000). The debates have produced no clear conclusions, although it is widely acknowledged that ownership, competition, and management all matter.

GOEs' service is rooted in prosocial behavior (Rainey 1982) which is an umbrella term used to describe acts undertaken to protect or enhance the welfare of the government and the people (Schwartz and Bilsky 1990). Specifically, the concept of the PSM is very similar to the Chinese traditional virtue (Cheng 2015). Without massive privatization, as experienced by the GOEs in many other economies, Taiwan employed its own methods of transformation toward a market economy. The underlying notion is that, if the GOEs are transformed into market-oriented economic entities, they will have improved efficiency and performance. However, GOEs that effectively motivate their employees would more efficiently and completely achieve policy objectives. Understanding PSM not only helps increase the productivity and performance of GOEs but could also guide employment efforts to identify quality human resources. GOEs with talented employees are more successful, and talented prospective employees are generally attracted to GOEs that fulfill their employees' needs and wants. In all, it is of significance to investigate the transformation of GOEs like Taiwan so that further insights can be produced for the clarification of the role of PSM, psychological ownership (PO), and employee management. In so doing, it is also likely to shed light on the implications for public administration. More importantly, GOEs' service and PSM can be linked to a desire to help individuals and to contribute to society through GOEs' employment. For all these reasons, GOEs are a noteworthy and interesting part of the public sector.

Moreover, efforts to develop a longer international scale of PSM run into a greater potential for cultural differences to improve the understanding of the basic concept (Kim et al. 2013; Moynihan et al. 2013; Vandenabeele et al. 2014). Since the introduction and general acceptance of PSM in 1996, research examining the relationship between the dimensions of PSM and organizational behaviors has intensified. Dimensions of PSM have been replicated in an impressive series of studies across countries and cultures and remain fairly stable over time (Camilleri 2007; Cerase and Farinella 2009; Giauque et al. 2011; Kim 2009b; Kim et al. 2013; Leisink and Steijn 2009; Liu et al. 2011; Ritz et al. 2016; Ritz and Waldner 2011; Taylor 2007; Vandenabeele 2008). These studies show that different PSM dimensions predict performance. Moreover, there have been some studies that examine how PSM dimensions relate to work environments and outcomes, including gender, job selection (Christensen and Wright 2011; Kjeldsen and Jacobsen 2013), job satisfaction (Liu et al. 2013), personality (Jang

2012), external incentives (Chen and Hsieh 2014), love of money (Liu et al. 2014b), and organizational commitment (E. Camilleri and Van Der Heijden 2007). In particular, we explore how to apply PSM to different types of jobs (Sun and Gu 2017; Vandenabeele et al. 2014) or to serve others in ways connected to private sector jobs (Christensen and Wright 2011). These findings are important, as they emphasize that individual attitudes concerning public service can be affected by the organization; furthermore, identifying employees' attitude is crucial to improving organizational performance.

Relatively little research has been carried out with regard to the role of PSM in the GOEs. Poor human management, at the government and enterprise levels, continues to present a significant problem to many firms, even after changing ownership and introducing competition (Wade 1990). Some studies address this issue from a corporate governance perspective (Shirley and Walsh 2000; Stiglitz 2003; Williamson 1975), but here the management of GOE seems to require a broader dimension other than that covered by corporate governance. In the face of such a rapidly changing economic reform situation, which is often unique and different from other countries, researchers have had difficulty staying up to date with the pace of transformation of Taiwan's economy, including the transformation of GOEs. This research will also provide insights into the complicated nature of the interactions between GOEs' transformation and human resource management.

Ownership is a fundamental human concern (Isaacs 1933). It has been explored by various disciplines and within a variety of contexts. However, previous ownership studies have focused primarily on physical objects such as public ownership of GOEs, whereas almost no research has been conducted on the PO toward public entities. Although very little direct evidence on this issue is currently forthcoming, it is possible to contribute further insights to the comprehensive understanding of how an affect such as PSM influences the PO in the context of Taiwanese GOEs. Thus, contributing to the problem is the lack of understanding of PSM theory and PO by public personnel management. The objective of this study was to investigate which of dimensions of PSM predict PO of public employees in Taiwanese GOEs.

## Public Service Motivation and Psychological Ownership

Recent research suggests the existence of PSM (Crewson 1997; Kelman 1990; Perry and Hondeghem 2008; Walker et al. 2010). The theory of PSM focuses on the internal motivations of those in the public sector (Perry and Wise 1990). Perry and Wise (1990) formulated three propositions: (a) the greater an individual's PSM, the more likely it is that the individual will seek membership in a public organization; (b) in public organizations, public sector motivation is positively related to performance; and (c) public organizations that attract members with high levels of public motivation are likely to be less dependent on utilitarian incentives to manage individual performance effectively (Kim 2009a, p. 151).

Although the items of PSM could vary according to the national context (Kim et al. 2013), substantial research has found support for Perry's initial dimensions (Bright 2008; Coursey and Pandey 2007; Liu et al. 2008; Ritz 2009; Vandenabeele 2008). The scale was chosen for the current study due to its originality and its comparability with research results for comparative contexts. The PSM dimensions are commitment to the public interest (CPI), compassion (COM), attraction to public policy making (APP), and self-sacrifice (SS). Commitment to the public interest (CPI) generally refers to one's desire to fulfill a societal obligation or standard, particularly the desire to serve the public interest and the loyalty to duty and the government as a whole (Perry 1997). Compassion (COM) is characterized by the concept of patriotism of benevolence (Frederickson and Hart 1985), which represents an extensive love of all people within our political boundaries (Perry 1996). Attraction to public policy making (APP) refers to the degree to which an individual participates in the policy process or is committed to a particular public program because he or she personally identifies with and advocates for a special or private

interest (Perry and Wise 1990). Self-sacrifice (SS) represents the basic prosocial origins of PSM and refers to a willingness to deliver service without tangible personal rewards (Perry 1996).

Contemporary PO research started most notably with Locke, who argued that a property belongs to the person who caused it to be appropriated from the common store of nature (Locke 1952). In this study, PO is defined as "that state in which individuals feel as though the target of ownership (material or immaterial in nature) or a piece of it is theirs" (Pierce et al. 2001, p. 299). In other words, PO can be defined as a cognitive and affective experience of connection between the self and various targets of possessions, such as ideas, relationships with others, and physical entities (Pierce and Jussila 2012; Pierce et al. 2001). Pierce et al. (2001) described PO as an attitude with both affective and cognitive elements. They illustrated this with the following commonly used phrases that denote feelings of ownership or possession: "She is *my* daughter" and "That is *our* house!" include both affective and cognitive information based on affective judgments and more abstract beliefs. The concept of PO has been associated with employee well-being and organizational citizenship behavior, among other positive outcomes (Avey et al. 2009; Dyne and Pierce 2004). Moreover, the effects of PO are not static and are likely to change as GOEs' employees pass through different structural reform stages.

Thus, PO can be seen as a series of mutual expectations and needs arising from an organization–individual relationship (Pierce et al. 2009) or as the sum of mutual expectations between the organization and the employee (Pierce et al. 1991). PO may appear in different forms and have an apparent influence on employees' behavior and performance in the organization (Pierce and Jussila 2012). Actually, a number of empirical studies have discovered that PO may contribute to organizational dynamics and altruistic behavior (Pierce et al. 2004). Just as PSM research has attracted increasing attention in public administration and organizational studies literature, research on PO has also become a zeitgeist topic among public management and human resource management scholars. It is impossible to conduct research on PSM without considering empirical studies attempting to link the PSM theory to this important human resource issue (e.g., PO). The linkages represent the practical application and operation of PSM theory for GOEs' managers and human resource professionals.

CPI generally refers to one's desire to fulfill a societal obligation or standard, particularly the desire to serve the public interest and the loyalty to duty and the government as a whole (Perry 1997). According to Taylor's (2007, p. 940) hypothesis, "normative motives (e.g., CPI) will have a greater influence on job satisfaction than self-sacrifice." The results are consistent with those of previous studies, including Hondeghem and Perry (2009, p. 6), Taylor (2008, pp. 71–72), and Pedersen (2014). Moreover, GOEs' service is rooted in prosocial behavior (Rainey 1982) – an umbrella term used to describe acts undertaken to protect or enhance the welfare of the state and the people (Schwartz and Bilsky 1990). More importantly, GOEs' service and PSM can be linked to a desire to help individuals and to contribute to society through GOEs' employment. Past public organizational research (Cook 1999; Cook and Kirkpatick 2000; Ernst 1994; Graham 2000; OECD 2001) has documented the need for public interest within GOEs. Within this context, there are several different public services and organizational processes through which employees are afforded the opportunity to exercise public interest over a number of potential targets of PO. Thus, we hypothesize that:

### Hypothesis 1: There Is a Positive and Causal Relationship between CPI and PO

APP refers to the degree to which an individual participates in the policy process or is committed to a particular public program because he or she personally identifies with and advocates for a special or private interest (Perry and Wise 1990). APP appears to be positively related to PO. This is consistent with early studies that have found that public employees are motivated differently than their private sector counterparts (Crewson 1997; Liu et al. 2008, 2013; Perry 1997; Perry and Wise 1990; Rita 2011). Thus, the evidence suggests the

value of recruiting public employees with APP as they make positive contributions to public services. APP is an important component of PSM. Therefore, Pierce et al. (2009) argued that complicated jobs possess the characteristics that can arouse and satisfy the needs for PO and the structure features that promote the emergence of ownership feelings. As such, the statement aids our thinking about how the APP produces PO.

### Hypothesis 2: There Is a Positive and Causal Relationship between APP and PO

SS represents the basic prosocial origins of PSM and refers to a willingness to deliver service without tangible personal rewards (Perry 1996). PSM is an orientation toward organizational citizen behavior (OCB) as well as altruistic and prosocial behavior (Brewer and Selden 1998; Perry and Hondeghem 2008; Walker et al. 2010). Frey (1997) also found that many public sector employees work for lower salaries than they could expect in the private sector, which may reflect a higher level of intrinsic motivation. Thus, they perceive that their work efforts contribute value to the public. Therefore, in a collectivistic culture, employees in GOEs typically subordinate their personal interests to the goals of their collective, and their fulfillment and self-respect result from knowing and accepting their place in GOEs (Lodge 1987; Wagner and Moch 1986). Thus, we hypothesize that:

### Hypothesis 3: There Is a Positive and Causal Relationship between SS and PO

COM is characterized by the concept of patriotism of benevolence (Frederickson and Hart 1985), which represents an extensive love of all people within our political boundaries (Perry 1996). Anderfuhren-Biget et al. (2014) found that employees in charge of welfare state policies are inclined to have high levels of COM. Moreover, Giauque et al. (2012) revealed an undesirable finding that the COM and SS components of PSM increase the civil servants' job stress and resignation (psychological outcomes). Evidence from a number of studies is consistent with this assertion (Chang and Lu 2007; Liu et al. 2014a). Within the context of GOEs, there are a variety of opportunities for employees to involve themselves in different aspects of GOEs' services. This involvement of employees may come in many forms, such as the investment of their time, skills, decisions, and physical and psychological energies, resulting in PO. Thus, we hypothesize that:

### Hypothesis 4: There Is a Positive and Causal Relationship between COM and PO

In this research, we argue that PSM has an influence on PO, and we examine four dimensions of PSM influence via a well-established relationship between PSM and PO. In this paper, we develop a specific relationship to further analyze the effect of dimensions of PSM. An explanation of how our research contributes to PSM and PO knowledge and the implications for public personnel management are provided.

## Method

People who work for GOEs in Taiwan have recently become a target for public scorn (Cheng 2013). Due to globalization and privatization, GOEs are facing vivid and intense structural changes (Beesley and Cave 1998; Graham 2000; Sherman 1989). Because of these dynamics, GOEs' performance is becoming dependent on employees' responsive and reflective actions in terms of their PO. Employee turnover after a privatization program is a fundamental issue for government leaders and public management researchers. Therefore, understanding the concept and antecedents of PO is becoming imperative for GOEs to survive in a challenging and dynamic economic world.

### Samples

GOEs touch the majority of people in advanced and developing countries on a daily basis. GOEs shore up our lives, and, therefore, knowledge about human resource strategies to improve their performance is of importance to the common good of society. The present study adopted a cross-sectional approach using a large-scale questionnaire survey in Taiwan ($N$ = 1,087).

Participants from four GOEs in an infrastructure-relevant ministry, the Ministry of Economic Affairs (MOEA), and heterogeneous sectors were recruited, including representatives of the Taiwan Power Company (TPC); CPC Corporation, Taiwan (CPC); Taiwan Sugar Corporation (TSC); and Taiwan Water Supply Corporation (TWSC). They are all GOEs performing a public service and subject to special governmental regulation.

Adhering to the commonly used standard of 3% sampling error and 95% confidence level (O'Sulivan and Rassel 1989), this study's sample consisted of 1,087 GOE employees from MOEA, and the response rate was about 68% (1087/1600), which included 497 males and 590 females from 4 GOEs as follows: TSC ($n = 267$), TWSC ($n = 203$), TPC ($n = 312$), and CPC ($n = 305$). Among the participants, 54.2% were female, the average age was 39.67 years (SD = 6.20), and the average job tenure was 12.03 years (SD = 5.38). Data were obtained during a concurrent test validation project. Prior to testing, all participants were given a letter containing a brief explanation of the study's purpose (i.e., test validation) and a research statement ensuring the confidentiality of their individual test results.

## Measures

A random sampling procedure was used to select the sample. Using this sample procedure is an excellent opportunity to obtain information from different GOEs. The study adopted a cross-sectional approach to measure all variables simultaneously. An anti-common method variance (CMV) strategy was also embedded in the measurement. To ameliorate the effects of CMV resulting from the utilization of self-rated measures, the author collected the data in two stages. CMV emerges when self-rated measures are simultaneously used, as in some cases the observed relationships between variables are inflated, jeopardizing the reliability of data analysis (Podsakoff et al. 2003). We adopted Harmon's single factor test to examine the potential CMV (Podsakoff et al. 2003). All the research variables were first merged into one factor, and the results showed poor fit, suggesting that one single factor of merging all variables was inappropriate for data analysis ($x^2(272) = 3546.64$, $p < 0.001$, RMSA = 0.088, NFI = 0.46, CFI = 0.46, IFI = 0.47, SRMR = 0.17). We then adopted an unmeasured latent construct method to measure the potential influence of CMV as recommended by Podsakoff et al. (2003). The chi-square difference test was not statistically significant ($\Delta x^2(1) = 3.59$, *ns*). The results were consistent with the findings of Harmon's single factor test. To simplify, the influence of CMV was very slim; hence, the research dataset should be accepted for further data analysis. Results showed that coefficients (α) ranged from 0.18 to 0.61 and that no coefficient was close to (or higher than) 0.70. These statistical figures jointly indicated that CMV bias was unlikely to have occurred in the present research. A series of standardized scales was used, as discussed in the following subsections.

### PSM

Perry (1996) developed a measurement scale for PSM. The outcome of Perry's study was the development of 24 items measuring the 4 empirical dimensions of the PSM construct. Sample items included: "Meaningful public service is very important to me," "I am often reminded by daily events about how dependent we are on one another," "Making a difference in society means more to me than personal achievements," "I am prepared to make enormous sacrifices for the good of society," and "I am not afraid to go to bat for the rights of others even if it means I will be ridiculed." Participants' responses were recorded using a 7-point Likert scale (1 = *completely disagree*, 7 = *completely agree*). Higher scores meant higher levels of PSM, indicating that participants demonstrate more PSM for PO. Cronbach's alpha was 0.87.

### Psychological Ownership

For psychological ownership variables, the 7-point Likert scale with seven questions developed by Pierce et al. (1992) and later tested by Van Dyne and Pierce (2004) was originally used as 5-point Likert scale with five questions. The internal consistency of the sub-variables

mentioned was measured as (Cronbach alpha) 0.905. The outcome of Pierce et al.'s (1992) original PO scale was the development of seven items. Sample items included: "This is *my* organization," "I sense that this organization is *our* company," "I feel a very high degree of personal ownership for this organization," "I sense that this is *my* company," "This is *our* company," "Most of the people that work for this organization feel as though they own the company," and "It is hard for me to think about this organization as *mine* (reversed)." Participants' responses were recorded using a 7-point Likert scale (1 = *completely disagree*, 7 = *completely agree*). Higher scores meant higher levels of PO, indicating that participants demonstrated more PO. Cronbach's alpha was 0.86.

## Results

Confirmatory factor analysis (CFA) was conducted to assess the reliability and validity of the multi-item measures for the research constructs. Several indices were used to assess the fit of the measurement model. The overall model fit was excellent, with the goodness-of-fit index (GFI), the adjusted goodness-of-fit index (AGFI), and the normed fit index (NFI) all exceeding 0.90 as well as the root mean square residual (RMSR) being below 0.05. These items loaded as expected, with all the $\lambda$'s significant at $p \leq 0.001$. The overall model fit was good, with GFI and NFI over 0.90 and AGFI being 0.87, although the RMSR was 0.07 (Bentler and Bonett 1980; Byrne 2006; Hair et al. 2010). The reliability of the multi-item scale for each construct was measured using Cronbach's alpha and composite reliability measures. Both measures of reliability were above the recommended minimum standard of 0.60 (Bagozzi and Yi 1988). The reliability indicated by Cronbach's alpha was consistently above 0.70 for constructs. Convergent validity was verified using the *t*-statistics for the path coefficients from the latent constructs to the corresponding items. All the *t*-values considerably exceeded the standard of 2.00 (Anderson and Gerbing 1988), indicating a satisfactory convergent validity of each construct. Divergent validity is supported if an unconstrained model (in which the correlation between the two constructs is freely estimated) demonstrates a significantly better fit than a constrained model (in which the correlation between the two constructs is constrained to 1) (Anderson and Gerbing 1988). In each case, the chi-square of the unconstrained model, compared with that of the constrained model, was significantly decreased, indicating that divergent validity was achieved. Furthermore, the amount of variance extracted by each construct was greater than the squared correlation between the two constructs, suggesting that divergent validity was achieved (Byrne 2006; Fornell and Larcker 1981; Hair et al. 2006).

Tables 1, 2, 3, 4, 5 and 6 describe the relationships among the PSM dimensions and PO in each GOE. The results in each GOE indicated that, for

**Public Service Motivation and Psychological Ownership in Taiwan, Table 1** Intercorrelations among PSM and PO in the MOEA ($n = 1087$)

| Variable | M | SD | COM | SS | APP | CPI | PO |
|---|---|---|---|---|---|---|---|
| COM | 17.34 | 6.51 | (0.84) | | | | |
| SS | 26.84 | 5.33 | −0.35** | (0.72) | | | |

*APP* attraction to public policy making, *COM* compassion, *CPI* commitment to the public interest, *SS* self-sacrifice, *PO* psychological ownership
$*p < 0.05$; $**p < 0.01$

the MOEA, compassion (COM) was significantly negatively correlated with PO, while commitment to the public interest (CPI) and self-sacrifice (SS) were significantly positively correlated with PO.

Multiple regression analyses were conducted to investigate the predictive power of each dimension of PSM on PO. The self-sacrifice (SS), compassion (COM), attraction to public policy making (APP), and commitment to the public interest (CPI) were integrated into the models. Table 6 indicated that CPI was the one construct that significantly and consistently predicted PO across four GOEs. Standardized $\beta$ for TSC, TWSC, TPC, and CPC was 0.28, 0.26, 0.42, and 0.32, respectively (all $p < 0.01$). Self-sacrifice

**Public Service Motivation and Psychological Ownership in Taiwan, Table 5** Intercorrelations among PSM and PO in the CPC Corporation, Taiwan ($n = 305$)

| Variable | M | SD | COM | SS | APP | CPI | PO |
|---|---|---|---|---|---|---|---|
| COM | 23.63 | 6.33 | (0.75) | | | | |
| SS | 25.74 | 4.34 | −0.23** | (0.51) | | | |
| APP | 29.29 | 4.22 | −0.12* | 0.18** | (0.43) | | |
| CPI | 31.41 | 4.63 | −0.32** | 0.36** | 0.26** | (0.70) | |
| PO | 31.53 | 4.32 | −0.21** | 0.21** | 0.15** | 0.33** | (0.87) |

*APP* attraction to public policy making, *COM* compassion, *CPI* commitment to the public interest, *SS* self-sacrifice, *PO* psychological ownership
$*p < 0.05$; $**p < 0.01$

**Public Service Motivation and Psychological Ownership in Taiwan, Table 6** Results of multiple regression analysis for all GOEs with PO as dependent variable and the PSM as predictors

| | Standardized $\beta$ | | | |
|---|---|---|---|---|
| Dimension | TSC (n = 267) | TWSC (n = 203) | TPC (n = 312) | CPC (n = 305) |
| COM | −0.18** | −0.16** | −0.12* | −0.22** |
| SS | 0.17* | 0.08* | 0.18* | 0.17* |
| APP | 0.16** | 0.07* | 0.01 | 0.00 |
| CPI | 0.28** | 0.26** | 0.42** | 0.32** |
| $R$ | 0.42 | 0.34 | 0.53 | 0.56 |
| $R^2$ | 0.22 | 0.14 | 0.28 | 0.32 |
| *Adjusted* $R^2$ | 0.19 | 0.13 | 0.28 | 0.31 |

*APP* attraction to public policy making, *COM* compassion, *CPI* commitment to the public interest, *SS* self-sacrifice
Notes: $*p < 0.05$; $**p < 0.01$

(SS) was a significant predictor in four GOEs: TSC ($\beta = 0.17$; $p < 0.05$), TWSC ($\beta = 0.08$; $p < 0.05$), TPC ($\beta = 0.18$; $p < 0.05$), and CPC ($\beta = 0.17$; $p < 0.05$). However, COM was the only construct that negatively predicted PO across four GOEs: TSC ($\beta = -0.18$; $p < 0.01$), TWSC ($\beta = -0.16$; $p < 0.01$), TPC ($\beta = -0.12$; $p < 0.05$), and CPC ($\beta = -0.22$; $p < 0.01$).

According to previous studies (cf. Pandey and Stazyk 2008), demographic variables (e.g., gender, age, and tenure) might predict PSM while having effects on PO. In Step 1, we entered age, gender, and tenure as three control variables to examine how much variance in the dependent variables was accounted for by the control variables and then added the four dimensions of PSM into the regression equations to jointly analyze the effects of the independent variables and control variables on the dependent variable (i.e., PO). Table 7 displays the regression results. The results indicate that age has a significant association with PO, implying that older GOE employees have more PO than younger ones.

The data in Table 7 also demonstrate the separate effects of the dimensions of PSM on PO. Two of the four dimensions of PSM (CPI and SS) were found to be significantly associated with PO. As Table 7 shows, when the dimensions of PSM were added to the regression model, the increases in the model multiple correlation square were significant ($p < 0.01$), although the absolute magnitude was not large ($\triangle R^2 = 0.16$). Specifically, CPI had a marginally significant and positive effect on GOE employees' PO (Beta = 0.38; $p < 0.01$). SS also had a marginally significant and positive effect on GOE employees' PO (Beta = 0.18; $p = 0.09$). APP was not found to have a significant effect on the respondents' PO (Beta = −0.14; $p = 0.56$), while no significant effect was found between COM and PO (Beta = −0.01; $p = 0.86$).

**Public Service Motivation and Psychological Ownership in Taiwan, Table 7** Results of hierarchical regression analysis with PO as dependent variable (n = 1087)

| Variable | Model-tested Beta | |
|---|---|---|
| *Step 1: control variables* | | |
| Gender (1 = male, 0 = female) | 0.12 | 0.08 |
| Age | 0.18** | 0.18* |
| Tenure | 0.14 | 0.13 |
| *Step 2: Independent variables* | | |
| Commitment to public interest (CPI) | | 0.38** |
| Self-sacrifice (SS) | | 0.18* |

| *F* test | 3.75*** | 5.86*** |

Notes: * $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$; Beta = standardized regression coefficients

## Discussion

The results indicated that CPI was the one dimension of PSM that significantly and consistently predicted PO of employees across four GOEs via multiple and hierarchical regression analysis (see Tables 6 and 7). Consistent with Hypothesis 1, a positive and causal relationship existed between CPI and PO. This is also consistent with early studies (e.g., Crewson 1997; Hondeghem and Perry 2009, p. 6; Kelman 1990; Kim and Vandenabeele 2010; Rainey 1982; Taylor 2008, pp. 71–72). For example, March and Olsen asserted that public sectors (e.g., GOEs) are "based on a shared history and valued way of life, a shared definition of the common good" (March and Olsen 1989, p. 161). Moreover, Pierce et al. (2001) pointed out that the more information and the better the knowledge an individual has about an object, the deeper the relationship between the self and the object and, hence, the stronger the feelings of ownership toward it. Such employees in GOEs are likely motivated by commitment to the public interest and by fulfilling obligations. Employees in GOEs come to find themselves psychologically tied to GOEs as a result of their active participation in or association with those sectors. It is not surprising that CPI was a dimension of PSM that could predict PO of GOEs' employees from various service sectors. Indeed, employees with PSM tend to be more considerate toward their fellow employees and more likely to help their fellow employees with job tasks. Thus, it can be argued that PSM leads to behaviors associated with positive organizational citizenship behaviors, consistent with Kim's (2005) results. It is not surprising that CPI was the only PSM dimension that consistently predicted PO of employees from various GOEs. In part, because CPI is central to the employee–GOE relationship, this increased sense of ownership for CPI over time is likely to spill over and give rise to similar ownership feelings for GOEs (Peng and Pierce 2011). As previously acknowledged, the CPI dimension of the PSM provides GOEs' context where there are significant opportunities for PO to take root within employees of an identifiable collective. Thus, we are inclined to believe that public interest is central to the employee's relationship with the GOE.

The results also indicated that SS appears to be positively related to PO via multiple and hierarchical regression analyses (see Tables 6 and 7). This supports Hypothesis 3, as there was a positive and causal relationship between SS and PO. Thus, the present study was consistent with previous studies, such as Liu et al. (2014b), Perry (1997), and Coursey et al. (2008). Those with a higher level of PSM have chosen careers in public service (Brewer 2003; Houston 2006) associated

with higher PO. Moreover, public human resource managers in GOEs can align incentives with intrinsic motivations by designing compensation systems that emphasize long-term attractiveness to GOEs' employees and avoid pay for performance that might crowd out intrinsic motivation (Anderfuhren-Bigeta et al. 2010; Perry and Hondeghem 2008). Rainey (1982, p. 243) characterized public sector employees as placing "a high value on work that helps others and benefits society as a whole, involves self-sacrifice, and provides a sense of responsibility and integrity." Furthermore, Perry (1997) found many significant relationships, such as a negative relationship between professional identifications and public policy making, but a positive relationship between professional identification and civic duty and self-sacrifice. Coursey and his colleagues (2008) also found strong support for Perry's original exploratory research. Most notably, their results showed an improvement on the SS dimension from the original model because SS employees experience a stronger propensity toward civic duty than their carefree counterparts (Liu et al. 2014b) and tend to work toward goals in an industrious and disciplined fashion. Pierce et al. (2003) also concluded that responsibility for a target leads to feelings of ownership – that is, as an employee is held or feels responsible for a GOE, he/she begins to invest himself/herself into that GOE through the energy, care, and concern expended. SS provides us with whatever job security that we have and plays a key role in making us candidates for career advancements. Finally, SS consumes the majority of our time and energy while at our place of employment and plays a key role in shaping the image that we form of ourselves.

PSM, as observed in the West, also exists in Taiwan (Chen and Hsieh 2014; Cheng 2015; Jang 2012), but the generalizability of the construct is limited: two of the four dimensions of the original PSM (CPI and SS) were significantly positively correlated with PO, but COM was significantly negatively correlated with PO via hierarchical regression analysis (see Table 7). However, Giauque et al. (2012) revealed an undesirable finding that COM and SS components of PSM increase the civil servants' job stress and resignation. In addition, the present study was also inconsistent with Anderfuhren-Biget, Varon, and Giauque's (2014) study, which found that employees in charge of welfare state policies are inclined to have high levels of COM. It is important to recognize that researchers who have thought about COM and PO have called our attention to the negative effects: counterproductive working behavior, stress, refusal to share, etc. Thus, PSM could be conceptualized as an altruistic service-related value, such as the desire to help others, benefit the public, or engage in meaningful public service (Crewson 1997). PSM varies across GOEs in Taiwan. This does not mean that the Taiwanese GOE is devoid of COM, and it is very possible that COM has merely been suppressed in traditional public administration. With every new government there always appears to be a new political commitment to marketization for GOEs, but there is too much rhetoric and paperwork rather than actual action in the context of Taiwan. As a result, the current findings indicate that it may be inappropriate to put PSM into practice and neglect PO, particularly in a market-orientation service. GOEs seeking to increase PO may want to consider techniques that increase SS as well as the CPI dimension of PSM.

Trying to find reliable answers is also challenging due to the potential for the social desirability effect; the implication is that researchers should unpack the PSM and PO concepts and strategically explore subdimensional relationships, but these results offer new insights into the influence of such subdimensions on the link between PSM and PO. Nevertheless, from a practical perspective, the present study has opened a new avenue for public HR practitioners to tackle PSM. Specifically, the findings here have revealed that CPI was the only dimension of PSM that very significantly predicted employees' PO across four GOEs. The findings also indicated that SS appears to be positively related to PO in the context of GOEs. PSM in GOEs has the great potential to enhance PO through high levels of CPI and SS. Furthermore, GOEs' management staff should acknowledge the value of PSM for PO

and, if applicable, praise it with substantial rewards. Following this advice may be initially costly to GOEs; however, the consequences should bring foreseeable benefits to both GOEs and employees in the long run. This indicates that GOEs can use and maximize the possible and positive effects of PSM by HR practice. Future research should be sensitive enough to explain the difference among service sectors and countries.

## Conclusion

Public personnel managers may discover that the findings have utility for the determination of future support mechanisms and the institution of new policies among employees in GOEs but should be viewed in light of some limitations. First, we tested our theory using a limited sample of public employees from Taiwan's GOEs. The cross-sectional design does not offer a clear cause-and-effect relationship as examined in the current study. Data collected only from GOEs in a Taiwanese sample may cause concerns for the generalizability of the present findings to other settings. PSM, due to its self-reported nature, involves the possibility of CMV (Podsakoff et al. 2014). However, the methods applied to avoid CMV may not alleviate the problem (Jakobsen and Jensen 2015; Meier and O'Toole 2013). To overcome this potential problem, future researchers may use a longitudinal design and measure variables (with other dimensions of PSM) (see Giauque et al. 2011; Kim et al. 2013; Vandenabeele 2008) at different intervals, providing enhanced conditions for the comparison and analysis of causal relationships.

Second, the current empirical findings are based on Taiwan's GOEs. Therefore, our observations should be interpreted with caution, because GOEs per se and their employees in general may have different backgrounds and dimensions of PSM from those in private sectors or public enterprises in other countries. It should be acknowledged that PSM represents psychological factors that could be influenced by multiple individual and organizational factors. It would prove useful to replicate the study using data from other settings to see if the results hold in different kinds of public enterprises and countries (Perry and Hondeghem 2008). A broader sample of employees would make the empirical results more generalizable beyond our country-specific findings.

Finally, the results of the current study indicate that the four dimensions of PSM display appreciable correlations with PO and that the four-dimension model is a fruitful basis for examining the dispositional source of PO. Whether other variables can contribute uniquely to the explanation of PO beyond the effects of PSM remains a question for future research. There is a need to use multi-method designs combining qualitative methods with longitudinal designs to better explore the dimensions of PSM. Future studies should attempt to model the organizational processes that may explain the relationships of PSM with PO.

[2]Department of Public Administration and Health Services Management, University of Ghana Business School, Accra, Ghana

## Synonyms

African countries; Literature review; Public administration; Public management; Public service motivation

## Definition

Public service motivation is defined as "an individual's predisposition to respond to motives grounded primarily or uniquely in public institutions and organizations" (Perry and Wise 1990: 368). Similarly, Brewer and Selden (1998: 417) defined PSM as "the motivational force that induces individuals to perform meaningful public service," while Rainey and Steinbauer (1999: 23) maintained that PSM is a "general, altruistic motivation to serve the interests of a community of people, a state, a nation or humankind." One of the most widely used definitions was given by Vandenabeele (2007: 547) as "beliefs, values and attitudes that go beyond self-interest and organisational interest, that concern the interest of a larger political entity."

## Introduction

The emergence of the concept of PSM is accredited to a discussion on public service ethics in the 1970s aimed at providing a counterview to cynical perceptions of self-interested, extrinsically motivated bureaucrats depicted by public choice theorists. Drawing insights from the work of Rainey (1982) which showed that public sector employees have stronger interest in pursuing ideological or altruistic goals than their private sector counterparts, Perry and Wise (1990) developed the idea of PSM. Over the last two decades, studies on PSM have reached new heights. For instance, 147 articles were published on PSM between a period of 14 years – 1998 to 2012. This however increased significantly to the extent that a total of 136 articles were published on PSM between 2013 and 2014 (Ritz et al. 2016). It is not surprising given the popularity and so much interest that PSM research has generated including efforts to advance measurement and operationalization of the concept as well as suggestions for methodological advancement (Kim 2017).

Though, several literature reviews have been published on PSM (e.g., Ritz et al. 2016; Van de Wal 2015; Perry and Vandenabeele 2015; Vandenabeele et al. 2014), none of them concentrated exclusively on Africa, leaving the body of literature somewhat unstructured and possibly hampering future research. Meanwhile, a systematic literature review is a natural step forward to consolidate and advance research (Ritz et al. 2016). The chapter fills this void by providing a systematic literature review of PSM scholarship in Africa from 2005 to 2017 in order to build an agenda for future research. The chapter addresses the following questions: What are the publication outlets, number of authors, and publications of African PSM scholarship? What research designs and methods are used in African PSM scholarship? What are the theories and content of studies of African PSM scholarship? What are the antecedents and consequences of PSM research in Africa? And what are the potential avenues for further PSM research in Africa?

## Methodological Approach

This systematic review focuses on publications discussing PSM in Africa from 2005 to 2017 and presents the state of knowledge in the field. The search started from 2005 because previous research has revealed that PSM research in non-Western settings started after 2005 (Van de Wal 2015). The keywords used for the search were "public service and motivation" and "PSM and Public Service," "public service and altruism," "public service and prosocial," "public work and motivation," and "public employee and motivation." Studies that were included in the present study were identified as follows:

First, a systematic search of seven major online databases – JSTOR, Public Administration Abstracts, Political Science Complete, ScienceDirect, ISI Web of Knowledge, African Journals Online, and Africa Bibliography.

Second, a search of 12 leading public administration journals.

Third, the concept of PSM as described by Perry and Wise (1990) had to be used in the article.

Fourth, the focus of the article must be on PSM conducted in Africa or with a sample from Africa.

Finally, the article must be published in English.

Articles not meeting these criteria were excluded, and this strategy made it possible to focus solely on PSM articles in Africa. One book chapter and one conference paper were included just to make sure that all articles on PSM in Africa were captured. Applying these criteria resulted in a set of ten research articles (marked with asterisk in the references).

## Findings

### Number of Publications, Authors, and Publication Outlets

Whereas African scholarship on PSM was almost nonexistent before 2005, it has grown in number steadily since 2013. A sum of ten PSM articles were published during the period of this study with slightly less than half published in 2016 (four articles, 40%). The 10 articles used for the review had samples from 18 African countries – Egypt 4, South Africa 3, Ghana 2, and Nigeria 2. The remaining countries have 1 each, Botswana, Burkina Faso, Ethiopia, Mali, Morocco, Rwanda, and Zambia. This illustrates a gradual interest in PSM research in Africa and even though relatively small but covered a number of countries in Africa.

Similarly, the number of authors of PSM research in Africa has increased over the past few years. A total of 23 different authors contributed to the 10 articles of this review as shown in Fig. 1. From only 2 authors in 2008, there have been a substantial increase in the number of new authors from 2013 to 2017 (20 authors), The highest number of authors – 13 – was recorded in 2016. Out of the 10 articles, 6 (60%) were co-authored, and out of this, 1 featured a partnership between authors from African institution and Western institution. The remaining articles featured a partnership between authors from non-Western institutions (1 article) and Western institutions (4 articles). The author affiliations showed the following: Ghana (7 authors, 31.82%), Nigeria (3 authors, 13.64%), the United Kingdom (3 authors, 13.64%), and the Netherlands (3 authors, 13.64%). Egypt, Botswana, Canada, the United States, Belgium, and South Korea had 1 (4.54%) affiliation each.

In terms of publication outlets, six (60%) of the articles were published in public administration/management journals, namely: *Public Administration Review*, *International Journal of Public Administration*, *Journal of Public Administration Research and Theory,* and *International Review of Administrative Sciences* – an indication of African PSM scholarship having established outlets for publishing its research. However, two journals were outside the discipline of public administration – *Personnel Review* and *Social and Management Research Journal* – implying that PSM is being studied in other disciplines and spreading across the social sciences but not an exclusive concept to the discipline of public administration.

**Public Service Motivation Research in Africa, Fig. 1** Number of authors per year (2007–2017)

### Research Designs and Methods

Almost all the studies in Africa used primary data collection methods mainly interviews and questionnaires. The data collection method predominantly used was survey questionnaires that are administered to respondents (5 articles, 50%), whereas three articles (30%) used secondary survey data from International and National surveys such as the World Values Survey, International Social Survey Programme (ISSP), and Egypt Labor Market Panel Survey. Only two articles (20%) employed a mixed method approach. A substantial share of the study participants were from the public sector, occupying managerial, non-managerial, or supervisory positions. Other participants included students in a Master of Public Administration (MPA) program and private sector workers. The sample size for the articles range from 60 to 12,085 respondents, with the study of Barsoum (2016) having the most extensive sample size – 49,211, consisting of 49,186 survey data and 25 interviews.

Research designs were categorized as either quantitative or mixed method. In other words, there was no pure qualitative design used in the articles analyzed. This resulted in 80% and 20% of the articles having used quantitative and mixed design, respectively. Similarly, Table 1 reports the various analytical techniques used in the articles that were reviewed. Inventory of the scales used to measure PSM in Africa reveals Perry's (1996) PSM scale as the main instrument. Half of the articles (50%) reviewed used all four dimensions of Perry's (1996) PSM scale. Some of the studies modified Perry's scale by using some of the dimensions in the scale but kept the changes in line with Perry's original scale.

**Public Service Motivation Research in Africa, Table 1** Distribution of analytical methods used[a]

| Analytical methods | Frequency | % |
|---|---|---|

| Qualitative analytical technique | 2 | |
| Total | 12 | 100.00 |

[a]Multiple classifications per study were possible

### Content of Study and Theoretical Approaches

The review categorized the various research goals into eight broad areas in accordance with the classifications employed by Ritz et al. (2016). Each study was coded according to this scheme, making it possible for multiple coding as illustrated in Table 2. The review of the scope and content of the various studies indicate that there is more room for further research in the field of PSM in Africa. Essentially, the review showed that there was no study that constituted a review or a research review on PSM in Africa. This may be partially attributed to the limited number and the "infant" development of empirical studies on the continent. However, this is unfortunate in that a systematic literature review serves as a natural step forward to consolidate and advance research in a particular field (Ritz et al. 2016).

Theoretical frameworks and approaches that were used in the articles were grouped in line with 11 major theoretical lines used by Ritz et al.

**Public Service Motivation Research in Africa, Table 2** Distribution of scope and content of study[a]

| Lines of study | Frequency | % |
|---|---|---|
| Correlating PSM with outcome variables | 10 | 26.32 |
| Implications for HRM/managerial practice | 6 | 15.79 |
| Correlating antecedents with PSM | 7 | 18.42 |
| Theory conceptualization, motives and dimensions, integration with other theories | 2 | 5.26 |
| Comparison (African country with countries outside Africa) | 3 | 7.89 |
| Further development of measurement instruments | 4 | 10.53 |
| Comparing PSM across sectors (public/private/nonprofit) | 6 | 15.79 |
| Review study/research overview | 0 | 0.00 |
| Total | 38 | 100.00 |

[a]Multiple classifications per study were possible

(2016) in their systematic review of PSM, even though only six were used in Africa PSM scholarship. The findings showed that theoretical frameworks used to explain the concept of PSM in Africa were adopted from available Western scholarship, such as rational choice theory, culture, job choice theory, and motivation as presented in Table 3. Even though there is evidence that the concept of PSM exists in many countries (Kim et al. 2013), the use of Western theories in African PSM scholarship is problematic in that there are cultural differences between the two contexts and this has a potential to influence both the antecedents and consequences of PSM.

### Antecedents and Consequences of PSM in Africa

The review showed that the most common researched antecedents were age, gender, personal values, and education (Barsoum 2016; Brenya et al. 2016). Other frequently studied variables include job attributes and behaviors, job security, academic specialization, training and development, and job stress (Gould-Williams et al. 2013; Ng et al. 2016; Oyewobi 2013). These findings are similar to other studies found in Western countries (e.g., Perry et al. 2008). Given the relatively small number of studies in this review, caution is required in generalizing the conclusions on the antecedents of PSM in Africa.

With reference to the empirically tested dimensions of PSM, findings of Brenya et al. (2016) in Ghana and Oyewobi (2013) in Nigeria reveal that a positive relationship exists among the dimensions of PSM and the desire of people to work in the public service and promote the interest of citizens. Similarly, findings from Ghana by Brenya et al. (2016) reveal a strong relationship between the desire of people to work in the public service and self-sacrifice. However, findings from Botswana shows that self-sacrifice and altruism have weak and no relationship respectively with people's desire to work in the public service (Ng et al. 2016). Again, findings also show that attraction to policy making has no effect on the decision of people to serve in the public sector (Brenya et al. 2016; Oyewobi 2013).

The review revealed that the most commonly researched consequences of PSM are job performance, person-organization fit (P-O fit), organizational citizenship behavior (OCB), job commitment, job satisfaction, job stress, and quit intentions (Barsoum 2016; Brenya et al. 2016; Gould-Williams et al. 2013; Kura 2016; Mostafa et al. 2015; Oyewobi 2013). These results are consistent with previous studies in North America, Europe, Asia, and South America that there is a strong relationship between PSM and other factors such as P-O fit, desire to influence public policy, work performance, and organizational commitment (e.g., Dur and Zoutenbier 2014).

**Public Service Motivation Research in Africa, Table 3** Distribution of underlying theories[a]

| Underlying theory | Frequency | Percentage (%) |
|---|---|---|
| Public administration | 10 | 47.62 |
| General theories of motivation | 4 | 19.05 |
| Job choice theories | 3 | 14.29 |
| Rational choice theories | 2 | 9.52 |
| Ethic, values, religion, and culture | 1 | 4.76 |
| Organizational culture | 1 | 4.76 |
| Total | 21 | 100.00 |

[a]Multiple classifications per study were possible

## Discussion of the Findings

This chapter adopted a rigorous review of the Africa literature on PSM with the purpose of providing a clear and comprehensive picture of the research done from 2005 to 2017. First, the number of authors in African PSM is consistently increasing. From 2 authors in 2008, who were both from Europe, it sharply increased to 23 authors by 2017 with African scholars (55.46%) dominating – a sign of African authors gaining grounds in PSM scholarships in their own "backyard." Excitingly, most of the articles (60%) were co-authored bringing a blend of different cultural backgrounds to PSM scholarship. Even though there are calls for context-specific theories on PSM, this collaborative research could also help in building universal theories of PSM as

called by recent studies. This also shows that African PSM research is not only of interest to Africans but Western scholars as well. Second, despite the "infant" nature of PSM scholarship in Africa, the publications are in highly ranked peer-reviewed journals. This demonstrates commitment to higher-quality research on PSM from African scholars and increased legitimacy of such research in the eyes of editors and reviewers.

Third, the findings showed that the antecedents of PSM in Africa include age, gender, personal values, occupation, education, job attributes and behaviors, roles, job security, and training and development. Similarly, the consequences of PSM in Africa among others are P-O fit, OCB, job commitment, job satisfaction, job stress, job performance, and quit intention. Thus, in general, findings of PSM research in Africa are similar to Western context. Perhaps, this is probably due to the use of similar theory, research methods, and instruments for measuring PSM. Despite these similarities there are few differences such as job security and cultural values. Indeed, the findings also showed that organizational factors such as values and culture, human resource practices, working conditions, and mission alignment strongly influence PSM in Africa.

In addition, the analysis of PSM scholarship in Africa brings to bear a number of methodological issues. First, the use of cross-sectional survey data (50%) raises concerns about the causality of the results, and perhaps, at the moment scholars should refrain from making causal interpretations of the result, but instead make associational inferences. Second, whereas most of the respondents are public sector-related employees, the samples were taken from respondents occupying managerial, non-managerial, or supervisory positions, MPA and MBA students, and unemployed youth. This shows that the respondents of PSM studies in Africa are skewed toward a "managerist" perspective and students raising concerns about the generalizability of the findings. Third, even though a different context, Western theories were used to explain PSM in Africa. Indeed, findings from Egypt (Barsoum 2016; Gould-Williams et al. 2013) show that Islamic culture influences the preference for public sector jobs.

## Avenues for Further Research

Even though efforts are being made to study PSM in Africa, there is the need for more PSM studies. First is testing or developing PSM instrument in Africa. Whereas there are differences between the West and Africa, most Africa PSM studies have used Perry's (1996) scale for measuring PSM. Similarly, little effort has been made to test Perry's (1996) PSM scale in Africa. To bridge this gap, it is suggested that Africa scholars take the field of PSM further by not only testing and validating Perry's (1996) scale or debunking Western PSM findings but also developing PSM instrument that fits the African context. Second, there is the need to examine how cultural differences affect the supply and motivation of workers in African public service. This includes research that disentangles the unique contributions of PSM vis-à-vis collectivism, which appears to have synergistic effects on PSM in Africa. Cultural theories especially Hofstede's (1983) cultural dimension framework could be useful in this direction.

In addition, it is crucial for further studies not to only compare Western and Africa countries but also compare several African countries in order to highlight possible differences and similarities in PSM findings given the different sociocultural practices across the African continent. Finally, the use of robust methodologies will help strengthen the existing results of Africa PSM scholarship. Thus, robust methodologies would increase both internal validity and contextual realism in PSM research in Africa. Among such robust methodologies may include policy-capturing and longitudinal research designs, field experiments, and quasi-experiments.

## Concluding Remarks

This chapter aimed at taking stock of PSM research in Africa from 2005 to 2017 in order to build an agenda for future research. Even though the review shows a paucity of PSM research in Africa, it is gradually gaining prominence especially since 2013 as the publications increased from 2 in 2008 to 23 by 2017 with most of the

articles published in highly ranked public administration/management journals. Quantitative research designs dominated with most of the data collected by survey instruments while theoretical frameworks developed in Western context and Perry's (1996) measurement scale widely used in African PSM research. Age, gender, personal values, education, job attributes and behaviors, job security, and training and development are the most widely studied antecedents of PSM in Africa while P-O fit, OCB, job commitment, job satisfaction, job stress, and quit intentions were the dominant studied consequences of PSM in Africa.

In terms of agenda for further research, it is imperative to not only test for the reliability and validity of Perry's (1996) measurement scale but also develop PSM scales that fit the African context. Comparative studies either within African countries or between Africa and Western countries are significant in understanding the nuances of PSM. Because the African culture is different from the Western context, future research needs to disentangle the unique contributions of collectivism which appears to be dominant in Africa and may have synergistic effects on PSM. Experimental and longitudinal studies are highly welcome as they would help increase internal validity as well as establish causalities in African PSM research findings.

# Public Trust in Government, Japan

Masao Kikuchi
Meiji University, Tokyo, Japan

## Synonyms

Accountability; Appropriateness; Capacity; Collaborative governance; Confidence; Equity; Government reform; Performance; Public support; Transparency

## Definition

Trust in government can be understood as positive perceptions of citizens about the state of government. It is grounded either in actual experiences or by the subjective assessment. Trust in government is both a driver of government effectiveness and an outcome of government actions and reforms.

## Introduction

The decline of public trust in government has developed to be a universal phenomenon. Many governments and international organizations have tried to identify the reason for the decline and, at the same time, to rebuild trust in government with reform measures (OECD 2013). Decline of trust in government may affect the efficacy of government policies. The declining support of government may contribute to the growing difficulty of recruiting the best and brightest for the civil service. The government distrust tends also to increase tax evaders. While government is losing its exclusive position in holding public sphere, well-informed critical citizens increasingly expect high quality services, streamlined administrative procedures, and to have their view and knowledge take into account in public decision making. Trust in government is a critical factor whether government and the society could achieve the consensus to have a more open and more collaborative governance structure (Pollitt and Bouckaert 2011).

There is a rash of incidents that made citizens cast their critical eyes on civil service in Japan in late 1990s and early 2000s; continuing media exposure of public officials' scandals implicated in sex, money, and even drunken driving. To take the National Pension Program for example, the government could not adopt environmental change such as declining working population and even misuse of deposit money with corrupted manner. Given the declining citizens' support, the government decided to dismantle the Social Insurance Agency in 2008. As this case indicates, both central and local governments in Japan now take the decline of citizen's support as a serious problem.

Against these backgrounds, this chapter discusses trust in government and the government efforts to (re)build trust in Japan. The chapter is basically divided into three parts. The first part checks into the level of trust in government in Japan with historical and comparative perspectives. By doing so, it tries to capture common and peculiar characteristics. It is followed by the critical assessment of Japanese government efforts to (re)build trust in government. The concluding part argues the challenges of government as to how government can identify the declining trust and how to respond it in the age of governance reform.

## Public Trust in Government in Japan

There are certain complexity and limitations to elaborate the trust in government in Japan due

to insufficient data (Pharr and Putnam 2000). Nonetheless, with its limited data, trust in government in Japan shows some different perspectives. Figure 1 illustrates the longest time series data on political satisfaction indicator monitored by the Cabinet Office. This indicates the steady decline of public trust in politics and government. Mostly less than 30% of the respondents are satisfied with the government. Downturn from the mid-1990s would be the reflection to the citizen's low evaluation toward the central government. Its trend corresponds with the policy failures and corruption outbreaks in the 1990s. As Pharr and Putnam (2000) pointed out, misconduct reports in media may offer an important key to the understanding declining citizens' confidence in government.

Another credible study endorses these negative views of Japanese citizens about their governments. A 2017 report by the Central Research Service "Trust in Social and Public Institutions" revealed that of ten Japanese social institutions, bureaucrats were the second least trusted institution (average trust level was 2.6 on a five-point scale). Nine of its surveys (2000, 2001, 2004, 2007, 2008, 2009, 2012, 2015, and 2017) showed that the national civil service was the least trusted of the ten institutions in five times (The Central Research Service 2018). All the other institutions' (with the exception of Members of Parliament) trust levels were higher than national civil service in 2017 survey: Self Defense Force (3.7), Medical Institutions (3.6), Commercial Banks (3.5), Judicial Court (3.5), Police Officers (3.4), School Teachers (3.3), Big Businesses (3.1), Media (2.6), Civil Service (2.6), and Parliament Members (2.5).

Low level of trust in its national government by Japanese people seems to fit a global trend of declining public trust in national governments; however, when local government is included, the results are somewhat different. Most research on trust in government has been focusing on trust in government at national level, but evidence suggests that trust in government is somewhat higher at the local level (Hetherington 2006). These differences are probably attributable to the fact that citizens have more contact with their local government officials and generally identify more with smaller governments. Compared to trust in national government, trust in local government level has remained more stable over time.

Public trust in local government in Japan is higher and more stable than in national government level as well (Kikuchi 2013). Although recent and reliable data are unavailable to compare the trust level between central and local level,

**Public Trust in Government, Japan, Fig. 1** Evolution of Trust in government in Japan. (Source: Prime Minister's Office, *Public Opinion Survey on Society and State* [each year; data on 1999, 2001, and 2003 are not available]). Note: Response ratio of "well" and "to some extent" for the question "Does national policy reflect the will of people?"

citizens may trust more in local government than central government. Moreover, this implies that alleged declining trust in government is more entrenched in central government level. It has been argued that the reasons for continuing trust in local government lie in the role and function of local government. They have been providing the extensive variety of social services much more so than any other countries. The conventional way to analyze the importance of local governments in a national system of government is to measure its expenditure size. The size of local public expenditure and the number of local civil service in Japan are about three times larger than that of national level. Local governments are central actors in various social services, including school education, welfare and public health, police and fire services, and the construction of sewerage systems. These wide roles and functions of local governments involve a close relationship with the daily life of citizen (Jennings 1998). Contrary to the declining role of national bureaucrats and hardly seen their activities, citizens seem to have much a big stake in their local governments. Local governments in Japan have succeeded in developing a sufficiently broad-based constituency for themselves.

This claim is partially supported by the fact that for most citizens, "the civil service" connotes the local civil service, not the national civil service. The National Personnel Authority (2005) surveyed, by questionnaire, the public perception of civil servant to the registered citizen policy monitor in the government. The survey asked "Which level of service do you call in your mind a 'Civil Servant'?" 35.5% chose Local Civil Servant, while 14% chose National Civil Servant; and the remaining 50% chose both.

For ordinary citizens, the image of the civil service is confined to the *local civil service*; for the national civil service, the most frequently contacted civil servant is a mailman (National Personnel Authority 2005). For citizens, the image of bureaucrats (literally *Kanryo* in Japanese) is that of an influential elite (Class 1) of public officials employed by the central government (Nakamura and Kikuchi 2011). Japanese citizens may believe that the root cause of problems lies not with the mailmen, but with the elite national civil servants who are never seen in daily public life. This view may persist because bureaucrats had extensive power to exercise. But once their image has deteriorated, it could be easy that their positive image turns into negative. Indeed, it is natural for citizens to have more trust in a local civil servant who daily serves public life than in a national bureaucrat who they have never encountered.

## Government Reform and Trust

In most nations, the government reformers quite explicitly pledged to improve their citizen's trust in government (OECD 2013). Re-building trust in government becomes one of the government reform agenda. This is quite salient among aggressive (former) New Public Management reformed courtiers (Pollitt and Bouckaert 2011; Suleiman 2005). In those countries, NPM reforms turned out to entail unexpected consequences, eroding public confidence in government. Theoretically, very fragmented and complex networks create the government hollowing out and they undermine the government capacities to deal with public problems. Also, many marketization and devolution processes to both front levels and private suppliers cause concerns about new emerging corruption problems. Moreover, fragmented and complex network of service delivery would result in government insensible and less visible. On the other hand, the government position for promoting any reform tends to raise citizen's expectations.

In New Zealand, one of the most aggressive NPM reformers trust in civil service significantly dropped to around 10% after a series of NPM led reform (State Service Commission 2000). In the UK, many initiatives to restore trust in government were taken under labor party administration in the 2000s. The main objective of "Government Modernisation" in the UK reform was to restore government capacity, which was regarded as once destroyed by the NPM inspired reforms, and the ultimate goal of the reforms was to restore public trust in government.

Reform and trust in government is an old and new issue in Japan. Its concept has been found for many years. As early as in the 1960s, the government recognized the significance of trust in government. The first Provisional Commission on Administrative Reform (called *Rincho* 1 in Japanese) was set up by law in 1961 and submitted its final recommendation in 1964. The commission modeled the Hoover Commission in the US federal government in its authority and structure. The commission member recognized the importance of citizen's support to accomplish its duty in its early session. The commission's activity was expected to encounter severe resistance from the old guard, both from the elected parliament members and the bureaucrats. The commission was afraid of that the bureaucrats did not accept the recommendations and parliament members watered down the reform bill in a legislative process. The commission had to request citizen to support their activity as a final constituency and a reform driving power. The commission utilized public trust in government as a strategic tool to promote reforms. By the same token, the Second Provisional Commission on Administrative Reform (called *Rincho* 2 in Japanese) employed the trust in government for a strategic tool to promote privatizations. With the media campaign, they provided many cases on how the Japan National Railway had misused resources in an inappropriate and inefficient manner.

However, the way the government exercise the public trust seems to change after the late 1980s. The collapse of the real estate and stock markets from the speculative bubble economy of the late 1980s left banks with huge portfolios of nonperforming loans. It triggered a series of bank crash result in a low growth era referred as "lost decades." For a long time, bureaucrats have been seen as more trustful social agents than the political party members in the government. However, prolonged economic stagnation with these events causes Japanese start to doubt the bureaucrats' capacity to deal with cumulative issues. Japanese commercial banking system was well controlled by the Ministry of Finance with the convoy system and its activity was bounded by strict regulations. Trillions of taxpayer's money was put into banking sector to offset the huge mountain of accumulated bad debts. It turned out how incompetent the government was to adopt the fierce global competition. In addition, high-ranking officials involved in scandals hit the headlines on TV and it accelerated public doubts. Two retired administrative vice ministers, once they sit in the highest position in the civil service carrier, had been arrested for alleged corruption in the late 1990s. Japanese citizens witnessed the dramatic fall of bureaucrats' prestige and clout in the 1990s.

To respond to this severe situation, the government had started to capture the decline of citizen's trust as a serious problem. For the government, trust in government was no longer for supporters to promote reforms. The government had to consider how to restore public trust in government. In 1999, National Public Service Ethics Law (Law No. 129 of 1999) was enacted with the parliament member's initiative and the article one of the law stipulated as follows. It was the first legislation which public trust in government was written into the law.

> The objective of this law is to ensure people's trust for public service, deterring activities that create suspect or distrust against the fairness of performance of duties by introducing necessary measures to contribute to retaining ethics related to the duties of national public service officials, acknowledging that national public service officials are servants of the whole people and their duties are to fulfill public service entrusted by the public.

In both at central and local levels, there have been many government reform programs both in late 1990s and 2000s in Japan. Although not every reform measures aimed to ensure trust in government in more explicit way, there are still other indirect measures to ensure public trust in government: improving efficiency, strengthening accountability, and ensuring citizen's participation. The issue is to clarify how each the individual reform content influences the components of trust in government although each kind of trust is interrelated to some degree.

At the central level, performance information from the comprehensive performance measurement and evaluation system starting from 2001

and the agencification of the government organizations may give a positive impact on trust, since the citizens and service recipients can evaluate the services with solid base. In contrast, privatization and streamlining of government services may create government less competent. Government's responsibility of service delivery became blurred with privatizations. Deregulation causes troublesome cases. For instance, there has been a big policy debate on the privatization of building inspection authority. Numbers of condominiums were turned out to be built and authorized with the poor earthquake proof. Other reform measures such as public information disclosure system, public comments system, and administrative procedure law, all these measures have some positive impacts. However, lots of poor performance and management cases were revealed with the information disclosure. This may have a negative impact on trust at the same time.

In comparison with the central level, there seems to be more positive impact on trust in government at the local level. Performance information provided by the performance management system furnishes citizens with the solid base information on service. The citizen's satisfaction survey is a part of the efforts to ensure performance trust. However, fiscal decentralization may have a negative impact for small and weak municipalities without enough tax bases. Public information disclosure system, public comments system, and administrative procedure ordinances have a positive impact on relational trust in the same way as at the central level. Furthermore, PPP or collaboration with NPOs and citizens has a significant impact on trust. This measure may induce the citizens' participation to reflect their view in decision making and service delivery. Although it is not quite certain these efforts for more participatory, responsive, and partnership local governance become successful, awareness of citizen's participation among local officials has been greatly improved.

In a nutshell, impacts of reforms at the central level seem to be rather limited and unsuccessful (Kikuchi 2007). These limited and even negative impacts correspond with the side effects of NPM (Dunleavy et al. 2005; Suleiman 2005). There are positive impacts on trust with the information disclosure efforts toward transparent government. However, these measures seem only confined to be utilized for the exposure of scandals in government. At the local level, there seems to have more positive impacts on trust in government. Local governments in Japan are indigenously close to the real public life with extensive list of functions and services. Nonetheless, local governments are currently encountering financial difficulties; the citizens would be disenchanted with the fraud of the reform, if the efforts of PPP or collaboration are just resulted in the off-loading of local governments' responsibilities to their citizens.

## Discussions and Conclusions

This chapter so far discussed public trust in government in Japan. It first checked into the state of public trust in government in Japan and assessing impacts of government reforms on trust. This final part tried to argue critical issues in discussing public trust in government for better understanding of the state and nature of public trust in government and for better understanding on how to improve public trust in the age of governance reform.

Many government reform policies presupposed that trust was decreasing or simply stated that trust was in crisis without solid empirical evidences. Incorrect diagnosis may lead incorrect treatments, and it is even harmful to existing trust. Trust is said to be declining; however, there is no conclusive evidence of general pattern of declining public trust in a global way (Van de Walle et al. 2008). It is mainly because due to lack of reliable long term data on public trust in government. Some countries seem to enjoy stable level of trust, and EU countries even gained trust after the global financial crisis. On the other hand, some country may suffer long erosion of trust in government, and the others may simply fluctuate based on business cycle of one's economy. Trust in government research flourished after widely believed that trust is declining among

policymakers. In other words, events that affect trust in government such as political scandals or government maladministration brought trust as widely discussed public agenda, and then polls followed. The result of the polls after the event may not reflect the general trend.

Or rather, policymakers and government officials now recognize that they need to rely on the citizens' moral support and voluntary compliance than ever, to make government work in more efficient and effective manner. So the attention on trust in these days would be the reflections of ever increasing dependence of government to the citizens, and impatience of the people in the government for the rush supports from the citizens.

It is generally believed that trust is in the other extreme side of distrust. However, low trust does not necessarily mean high distrust, and trust and distrust is not one dimensional and thus has different dimension. In other words, trust in government and distrust in government can coexist. NPM is based on both trust and distrust. It gives more autonomy with the expectations that managers use resources effectively. At the same time, strict audit of the performance with indicators is imposed based on the assumption that government officials seek public interests, unless otherwise controlled. More broadly, democratic institution exists based on public trust in government, and at the same time, it functions based on public distrust in government, as demonstrated in institutionalized check and balance mechanism. In discussing how to enhance or rebuild trust in government, one cannot put aside the existence and functions of distrust.

This dual approach from both trust and distrust leads us the question how much do we need to restore trust, or is there adequate or optimal level of trust? The same as too low trust, too much high trust would be dysfunctional. This question reminds us the concept of "good enough governance" coined by Grindle (2004). Among the multitude of governance reform that "must be done," there is no common understanding as to what is critical and what is not, what should be prioritized and what should follow, and what can be achieved in the short period and what can only be achieved in a long run (Grindle 2004). "Rebuilding public trust" is a catchall poplar slogan among reformers. However, often time they do not provide us "where" to go and "how" to achieve it. As too much high trust tends to become blind trust to the authority and thus even harmful, there should be much more attention on the high enough trust or necessary minimum level of trust for better understanding of the reform and trust issues, and priorities and feasibility of reform measures.

Relationship between trust and reform is not static, it is rather a dynamic process. Trust can be the cause, objective, driver, and leverage of the reform (Bouckaert 2012). Also, ostensibly lowering trust can be an outcome indicators of the reform to enhance transparency or anticorruption campaign, as most of hidden incidences under the table revealed with the reform. So there is a certain difficulty to identify the causal relations. Nevertheless, trust is still key concept in the reform agenda. That means one needs to carefully and explicitly conceptualize the trust in the reform. Public trust is now topical and a "buzz word" in the reform campaign and agenda. It seems to be even trust is overloaded in the reform process. Trust is an ambiguous concept, yet it is not the easy catchall concept for the reformers. This further research agenda noted above should be done for better understanding. More empirical and comparative study is necessary. Although there is certain difficulty, it is clear that further steps are necessary for better understanding of public trust in government. It is a considerably significant and necessary prerequisite in the pursuit of sound governance (Braithwaite and Levi 1998; Farazmand 2004). In that sense, trust in government is imperative for the future role and shape of public administration.

# Public Use Files: Keys for Successful Dissemination

Sergio I. Prada
Centro PROESA, Universidad Icesi, Cali, Colombia

## Synonyms

Anonymized data; De-identified data; Microdata; Open data; Open government; Public data; Public information

## Definition

A public use file is a data file published by any public or private organization that is free to download from the internet or free to access by other means.

## Introduction

Many government organizations are currently sharing data either online or by other means at no cost to users. These are called public use files (PUFs). Public release of data is part of an open data trend that benefits both governments and citizens in several ways. First, it enhances transparency and informs citizens about what kinds of data governments are collecting, which translates into more civic engagement and actions to hold governments accountable (Janssen 2011). Second, it generates mechanisms to improve government performance, leading to better provision of services and outcomes (Virnig and McBean 2001). Third, it is also very valuable for creating innovative products and services that help businesses and citizens alike. Fourth, it reinforces the right of freedom of information that has been constitutionalized in western countries (Huijboom and Van den Broek 2011).

However, the implementation of open data initiatives comes with several technical challenges. Before data becomes available to the public, there

P

are at least three phases that need to be sorted out: (i) data generation, (ii) collection, aggregation, and processing; and (iii) de-identification and privacy protection (Ubaldi 2013). There is a growing interest in releasing administrative data to the public; this entry summarizes valuable information about several dimensions of the process of doing so and lessons learned from successful initiatives (Prada and Martínez 2017).

## Keys for Successful Dissemination

All initiatives must start with a comprehensive background document; it must clearly specify what data is to be released and why that data is important to the public. It should have a discussion on the quality of the data and the frequency in which it will be published.

The next step is creating (and de-identifying) the file, this is a lengthy process that is better performed following a detailed and standardized procedure. De-identifying is a technical term that refers to the need to protect the privacy and confidentiality of the individual records in the file by deleting or transforming all information that could allow an intruder to identify the person, the household, or the unit of observation. For example, the inclusion of vehicle make, model, and year in conjunction with specific geographic identifiers is unacceptable because these items can be matched to automobile registration lists that contain name and address.

The US Government Confidentiality and Data Access Committee's (CDAC) "Checklist on Disclosure Potential of Proposed Data Releases" is widely used as the tool to assess disclosure risk of proposed data. This tool holds key questions to help practitioners to go through the many ways in which releasing certain information can compromise the file. Also important as a guideline is the Statistical Policy Working Paper 22 issued by the US Federal Committee on Statistical Methodology in which there is a complete discussion on statistical disclosure limitation methodologies and data confidentiality practices and procedures.

The result of this process is a checklist memo to be submitted to a Disclosure Review Board (DRB) or other similar panel for review. Government agencies must establish such DRB, and it must be staffed by experts on several disciplines including mathematicians, data scientists, and subject field experts such as physicians, demographers, economists, sociologist, etc.

One of the most critical information that needs to be removed from PUFs is geographic information. While few respondents could likely be identified within a single regions with millions of habitants, those respondents with rare and visible reported characteristics could be identified easily within a small geographic area. Removing geographic information could affect severely the analytic utility of the file, for that reason a compromise can be achieved releasing geographic indicators for populations after a certain threshold. For example, "all geographic areas that are identified must have a minimum of 100,000 persons in the sampled area."

Along the same lines, another key issue is whether to release statistical weights. The statistical final weight is the number of people in the population that the sampled person represents. PUFs whose data is collected through surveys only release final weights. They do not release the components that make up the final weight, because these may be indicative of geographic areas. They usually do not release the actual PSU and strata identifiers because that can be risky as well. Instead, they provide pseudo-strata and pseudo-PSU variables containing less information than the replicates.

Initiatives that would like to release data must be aware that the level of expertise necessary to create PUFs is high as well as interdisciplinary and scarce. Several senior statisticians and mathematicians must be involved in the PUF creation process. Additional experts are also involved, including DRB members and other senior staff who review the files before release and data analysis experts such as economists and epidemiologists (depending on the data collected). As far as internal personnel procedures, there must be also strict procedures. For example, some agencies require each new employee or contractor to watch a confidentiality video, sign a non-disclosure affidavit (which spells out the

particulars of the laws covering their conduct while under contract), and review documents and material dealing with their responsibilities with respect to confidential information while working at or for the agency. On departure from employment, the individual is also required to undergo an equally well-defined exit process.

In order to identify risk, the main criterion used to identify potentially identifiable records in PUF initiatives is whether a record is unique with respect to a combination of key variables. This method is called *k-anonymity* in the statistical disclosure control (SDC) literature (Skinner and Elliot 2002). Typically, demographic indicators such as gender, age, race, education, marital status, number of children, and geographical location are used to define combinations. Which variables and the exact nature of the combination(s) used must be defined by each agency or initiative.

Among the many SDC methods, currently there is no preference among SDC experts. Agencies use various techniques including coarsening, suppression, top and bottom coding, rounding, random rounding, and data swapping. The decision on which method to use is typically case specific and even variable specific. For instance, to protect people of very high age, usually age is top coding at "80 or older." It also depends on internal deliberation. Similarly, each initiative must develop its own algorithm for disclosure avoidance and refrain from using disclosure avoidance software. The reason for not using software is the possibility of reverse engineering.

Privacy and confidentiality can also be compromised if agencies do not take into consideration other files available to the public both online and off-line when evaluating the risk of disclosure. This is true for both external datasets and previously released data (e.g., reports, tables) from the same source. These comparative activities should be conducted both by in-house and outside contractors (particularly data security firms). The degree and level of sophistication of these activities vary but need to be accounted for.

As mentioned, instead of suppressing data all together from the file, data can be transformed; however, the risk in doing so is to alter the fundamental relationships among variables, which may result in utility loss. Thus, data utility analyses must be done before release and should concentrate on comparisons of means and distribution tests before and after disclosure treatment to determine their effect on pretreatment statistical characteristics of the data. In-house and consultant statisticians also should do multivariate tests to study effects on relationships among multiple variables. Data utility analyses are very important, and, in particular, the coordination of such analyses between statisticians and program directors (topic experts) is key to avoid unnecessary distortions in the data to be released.

Regarding access to the data, there are several alternatives, being the most common online query systems and online downloadable PUFs. Which method must be chosen in response to user demand. The degree to which access to detailed information is allowed (of the type that is not available in PUFs) depends on both the pertinence of the research question and the degree by which an individual (or individuals) can be held accountable for the use of the data.

Another issue in releasing data is the degree to which an initiative must warn users-to-be on confidentiality issues (such as to explicitly avoid actions aimed at re-identifying individuals).This is important and must be tailored to the importance of the release, ranging from short statements on the webpage where the data are located to the acknowledgment of online data use agreements (DUA) before download.

Similarly, documentation is a key success factor. Descriptions of data fields are provided in data dictionaries. Descriptions cover the content of each field, method of presentation, and disclosure avoidance steps taken to provide confidentiality. However, initiatives must be cautious of not revealing unnecessary information, and therefore the language used must be rather generic.

Lastly, there must be a clear communication strategy, both to promote and make sure the data is used and to listen to users. There are three main channels of two-way communication between initiatives and its users that are frequently used: email, phone numbers, and personal communication at conferences. Regarding diffusion of data releases, the main channels are via listserv and

notifications on agency's website. As for user feedback, when errors are discovered, either by staff or by users, corrections are made and the PUFs are re-released.

## Conclusion

Citizens, governments, researchers, and businesses are the likely beneficiaries of the open data government movement. Open data initiatives seek to make administrative data publicly available in a way that access and use is guaranteed without having to make a request or pay a fee for access to the government. This is done by publishing datasets directly on the governmental agency's website or on "open data portals" such as Data.gov in the USA or Data.gov.uk in the UK. Key to the sustainability and credibility of these initiatives is to preserve the confidentiality and privacy of personally identifiable information. However, it is now clear that success in this endeavor involves not only issues of privacy but also utility, that is, reaching out to the public to solicit input and to encourage use of the datasets for the public good.

While publishing datasets directly on websites is not new for statistical agencies or other producers of data, other public agencies are joining a movement that is now global, with at least 41 countries starting to make administrative data public.

To maximize the likelihood of success, PUF initiatives should allow enough time for development, begin with limited scope, gain experience, keep in focus the objective that motivated the project when facing challenges and obstacles, surround themselves by highly skilled SDC experts and program content analysts, allow enough time for rigorous and constant risk analysis, produce comprehensive documentation, provide users with more than raw data to spark and keep the interest in the files, have enough two-way channel communications, and design a tiered system of access to better respond to users' requirements.

Challenges associated with the creation of PUFs may be different depending on the source of data, be it from a survey or from administrative records. Several characteristics make survey data different and more suitable for release as PUFs: first, consent to include information in PUFs (provided confidentiality is protected) is usually explicitly asked and granted by respondents; second, survey data is usually comprised of small samples, where each individual represents hundreds if not thousands of people; third, while both are subject to reporting error, it is easier to track and compare administrative data than oral responses to a survey (e.g., income reported as $25,000 versus payroll records showing $25,550 as income).

Although there are successful initiatives to learn from, all face important challenges ahead. The first challenge is a lack of human capital. The re-identification threat is another major problem for PUFs given the increasing pace at which personal information is being collected, stored, and sold or shared in today's society. While it is true that the risk of re-identification is low, because it takes someone highly skilled in SDC methods and computer programming with the time, intention, and money to disclose the identity of a few records, what data producers fear the most is public embarrassment and a possible lack of trust by the public.

# Public Value Account: Establishment and Application

Shijun Li
College of Public Administration at Huazhong University of Science and Technology, Wuhan, China

## Synonyms

Public value accounting; Public value chain; Public value scorecard

## Definitions

Public value accounts include the use of collectively owned assets and associated costs, financial costs, unintended negative consequences, social costs of using state authority, achievement of collectively valued social outcomes, mission achievement, unintended positive consequences, client satisfaction, justice and fairness, etc. Public value account, like financial statements, has two columns. The left column is cost, and the right column is outcome, and each row represents the gain or loss of a specific value in a certain dimension. It is applied to specific public affairs and reflects an input-output relationship.

## Introduction

Public value theory is the fourth public management research paradigm after the traditional public administration, public policy, and new public management theory. In the context of market failure, public administrators should look for public values focused by a wider range of stakeholders and a stronger foundation of legitimacy.

The notion of public value has been increasingly important along with neoliberalism and new public management-oriented reforms. It arouses a rethinking of value-based norms of public sectors. The public administration transforming from governance and controlling to service and protection marks a fundamental change in the value paradigm. Nowadays, the creation of public values is critical to counteract reduction in credibility on account of fiscal restraint and departmental reduction in place, especially in the post-economic crisis.

As a concept rooted in the category of philosophy, public value has been introduced into the field of public administration since the 1990s, but the academic community has always lacked a clear and consensus definition of it. Generally speaking, there are three arguments for the analysis of public value: (1) public value based on citizens' expectations of the government (Moore 1995); (2) public value based on the collective preference of citizens (Stoker 2006); and (3) public value of consensus based on rights, obligations, and norms (Beck Jørgensen and Bozeman 2007).

In general, the core research issues of public value revolve around the definition, nature, characteristics, composition, classification, and quantification of public value, which can be summarized into four aspects:

1. Identifications of public value: the theories and methods of multiple public value identification; public value identification mechanism of public organizations; and public value mining based on big data.
2. Conflicts of public value: the source and mechanism of public value conflicts; the framework and path of public value conflict management; and the communication and negotiation mechanism of public values.
3. Creations of public value: research on the subject of public value creation; coordination and cooperation mechanism between public sections; and framework and path to realize public value.

4. Evaluations of public value: the evaluation framework of public value; methods and techniques of public value evaluation; and public sector performance evaluation.

Ambiguous definitions limit the fields and methods of application of public value theory, and the abstraction of value brings about controversies about measures and standards. Hence, the final problematic area is measurement. In order to make the value "visible," more and more attempts emerge. One of the main methods is "public value accounting" proposed by Moore (2014), which originated in accounting and then became popular in the public domain. This method aims to provide a reference framework for public administrators to identify and grasp important public values in practice while ensuring that government agencies have a clearer understanding of input-output situations. This comparison of benefits and costs is based on multidimensional assessments such as economic value (efficiency, productivity, and overall financial performance level), social value (fairness, transparency, and satisfaction), intangible value (humanity, structure, relationship, sympathy, and development), etc., whose dimensions change with changes in principles and perspectives. Another influential method is a public value-centric model, similar to the market failure model, proposed by Beck Jørgensen and Bozeman (2007). This model judges the degree to which the government department satisfies the public value standards based on "public values inventory."

## Towards a Public Value Account Measurement

Since Mark Moore puts forward the paradigm of public values based on public expectations, PVA has been proposed as a potential approach for articulating common goals that are valued by the stakeholders. Based upon the strategic triangle model (value, legitimacy and support, operational capability), PVA operates in an authorized environment. Moore argues that public sectors are responsible for the value of outcomes by PVA. So it calculates social and financial costs in the process of creating public value. As a result, its contribution is greater than the bottom line of the pure economy and customer satisfaction.

Public value accounts include the use of collectively owned assets and associated costs, financial costs, unintended negative consequences, social costs of using state authority, achievement of collectively valued social outcomes, mission achievement, unintended positive consequences, client satisfaction, justice and fairness, etc. (Moore 2013). With the different performance objectives of the government, the contents of the table change slightly, and the branches increase with complexity (Table 1). The division of levels naturally forms the hierarchy of public values.

PVA, like the financial statements, has two columns. The left column is cost, and the right column is outcome, and each row represents the gain or loss of a specific value in a certain dimension. It is applied to specific public affairs and reflects an input-output relationship. First, at the philosophical level, it identifies the important values that the public sector should create. And it is a response to the concerns of authorized environment at the political level. Then, it takes appropriate steps to populate the categories at the technical level. Last, at the management level, it motivates offices or staffs to focus on creating

**Public Value Account: Establishment and Application, Table 1** Moore's public value account

| Public value account | |
|---|---|
| Use of collectively owned assets and associated costs | Achievement of collectively valued social outcomes |
| Financial costs | Mission achievement |
| Unintended negative consequences | Unintended positive consequences |
| | Client satisfaction |
| | Service recipients |
| | Obligatees |
| Social costs of using state authority | Justice and fairness |
| | At individual level in operations |
| | At aggregate level in results |

valuable results and help them learn how to maximize the creation of public value.

## The Application of Public Value Accounting

Public value accounting is a systematic measurement method. When measuring government performance, three steps are followed. First, collect performance information through the "public value chain," and then use the "public value account" to guide public organizations to increase value creation, and finally use the public value scorecard to digitize the collected effective information, so as to complete the public value performance measurement of government.

### Public Value Chain

When evaluating the process and results of public value, the public value chain is the beginning of government public value identification. The value chain is evaluated along a process of five stages:

1. Input (capital control): evaluate and control costs (improve efficiency, performance, and allocation efficiency).
2. Organizational output process: record and monitor operations and conduct compliance audits (prevent fraud, waste and abuse, improve efficiency and effectiveness, and ensure consistency and fairness).
3. Output: assess the quantity and quality of the output results (create responsibility and learning).
4. Customer satisfaction: estimate citizen and customer satisfaction.
5. Social output: assess the desired social output.

Throughout this entire public value chain, a balance has been achieved between process evaluation and result evaluation of public value creation.

### Public Value Account

Public value account needs to be applied hierarchically. First, it identifies theoretically the important values that the public sector should create. These value groups are a response to the enabling environment. Second, it populates the input-output set in the public value account. Finally, it motivates staff to focus on creating valuable results and helps them learn how to maximize public value creation. It provides an important standard and framework for public administrators to establish public value.

According to the public value account model, a rough evaluation index system can be established. First, the public value account is a utilitarian way to raise the government's awareness of cost efficiency, that is, direct comparison of government fiscal expenditure and public satisfaction (left-right). Second, due to the difficulty in quantifying authority, the public value account measures the public authority used by the government in its actions by enforcing authority and absolutely obeying the financial expenditure required or by compensating citizens for infringement. Third, public value account lists and measures intangible values such as fairness and justice.

The starting point of public value assessment is mainly to help public institutions achieve the expectations of citizens. In addition to completing the tasks assigned by citizens, administrators must also meet citizens' requirements for reducing the cost of producing public value. The evaluation system, which is based on customer satisfaction, can represent the attitude and evaluation of the public on the public value production of public institutions. This requires that the government must produce more corresponding public value in order to protect citizens' rights while increasing customer satisfaction. At the same time, without justice, public policy has lost its foundation. For a public project, its audience is all citizens. The power and legality of the public sector is granted by citizens, and public resources serve the needs of citizens, and then the feedback effectiveness of citizens' acceptance of policies should be as fair as possible. Fiscal costs, institutional tasks, customer satisfaction, and fairness are complementary elements in the realization of public value, and they together constitute an essential element of public value evaluation.

### Public Value Scorecard

Based on the definition, analysis, and identification of inputs and outputs of public value, the public value scorecard translates the abstract view of creating public value into a series of specific performance evaluations. The public value scorecard is composed of a simple three-dimensional framework that contains value circle, legitimacy and support, and operational capability. In fact, the public value scorecard is to separate specific value goals step by step, so that the abstract value can be described by events that can be quantitatively described (Table 2).

Due to the complexity and potential conflicts of public sector policy evaluation, public sector administrators must refine and rank the complexity and importance of organizational goals under the value circle. At the same time, it is necessary to establish a multifaceted dialogue and consultation mechanism at a strategic level with the general public and participants in evaluation activities. In the end, the evaluation is based on the judgment of the organization's own capabilities, combining the public value account with the public value scorecard, so that the entire public value evaluation process is unified under the value circle and authorization environment.

## Conclusion

Under the public value theory centered on the creation of public value, the traditional model for measuring and evaluating policy choices and the quality of public services of government has become increasingly inappropriate. These policy tools can only capture certain aspects of public values such as service output and transaction costs that are easily quantified. Related values such as public value preferences, fairness, public satisfaction, and trust in government are not quantifiable. The public value accounting system is actually a set of processes suitable for measuring the value creation of the public sector in the framework of the analysis of the strategic triangle model.

**Public Value Account: Establishment and Application, Table 2** The three-dimensional of public value scorecard

| | The value circle | The legitimacy and support | The operational capability |
|---|---|---|---|
| Strategic objectives | Focus on the composition of the final value produced by the organization | Create an enabling environment | Improve the effectiveness and impact of organizational programs |
| Overall missions | Social goals of the public sector, such as:<br>1. Change the general situation of society<br>2. Reduce crime<br>3. Reduce early pregnancy in adolescents<br>4. Infant health<br>5. Reduce world population mortality | 1. Upstream customers and third-party payers<br>2. Establish a win-win relationship with funders<br>3. Follow other government charitable organizations, tax bureaus, and auditing agencies | 1. Organization output<br>2. Integrity of funds<br>3. Human resources<br>4. Partner capabilities<br>5. Learning and innovation ability |
| Secondary goals | 1. Human happiness index<br>2. Number of children who have been provided with immune protection<br>3. Routine physical examination of babies<br>4. Ensure a certain level of measles vaccination in Africa | 1. Monitor the utilization of physical and financial resources<br>2. Record who provided material financial resources<br>3. Improve the satisfaction of upstream customers and ensure their purchasing power | Compared with organizations that help the organization in terms of shared goals or ability:<br>1. Operating costs<br>2. Using methods to measure ideal output and ideal results<br>3. Estimated financial resources related to abuse, fraud, and waste in management, to increase output in standard activities |

In the process of identifying the specific public value preferences of a certain sector, public value chain lists the multiple values included, which are public, hierarchical, conflicting, and symbiotic. This process gives priority to the generation of public value. Then, in order to ensure the balance between public value creation and sacrifice, the public value account came into being. Through the form of left-right correspondence, the public value account intuitively shows the possible costs and benefits to avoid the sacrifice of value in order to obtain a higher total value or net value. Finally, the utilitarian approach, the commercialist approach, and the public value approach are combined through a public value scorecard. The arbiter of public value has expanded from a public administrator to all citizens, that is, representatives selected through democratic procedures will be committed to consider the wishes of all citizens, which also essentially change the facts of what needs to be truly evaluated. Although values such as fairness and justice cannot be easily measured, they can be objectively recorded and scored.

The ambiguity of value always affects the accuracy of measurement. First, in the process of consultation between citizens and government organizations, the imbalance of political resources may make it difficult to reach a value chain benchmark that meets citizens' value preferences. Second, with the diversification of stakeholder composition, the conflicting roles of administrators make the authorization environment more complex. Finally, subjective assessments of intangible factors such as democracy, trust, and fairness are susceptible to many factors such as the culture of public organizations, social changes, the level of civic service, and leadership behaviors of public organizations. Therefore, in the face of different public sectors with complex environments, conflicting goals, and different customers, it is difficult for public value accounting to form a fixed paradigm, which makes public value account doomed to be an open value account with changing subject.

## Synonyms

Bureaucratic initiative; Civic discovery; Criticisms of public value; Managerial realpolitik; Rhetoric

## Definition

Bureaucratic Rhetoric, or "public value as rhetoric," is a criticism of public value theory which asserts that public managers (bureaucrats) can employ the notion of "public value" as a rhetorical device in justifying their work, increasing their relative power, and allowing them greater intrusion into political affairs.

## Introduction

Public value theory is an area of inquiry in public administration that has gained many adherents over the past two decades, in part because it attempts to recontextualize the work of public administrators as a process that is driven by the co-creation of value by politicians, public managers, and citizens (Moore 1994; Moore and Khagram 2004). This notion of synergy among various elements of society, and their co-creation of value, has strongly resonated among practitioners (the bureaucrats and public managers themselves). However, there has been some skepticism among academics, and for a variety of reasons (see Alford and O'Flynn 2009), as to whether public value theory really does advance a better understanding of the role of the public manager.

In this regard, one of the most strident and enduring critiques is commonly referred to as **Public Value as Rhetoric**. Critics of public value raise an accusation that for all the talk of public managers about "creating public value," what is really at work is merely a rhetorical ploy (Oakley et al. 2006; Alford and O'Flynn 2009), which uses the unobtrusive and mild language of "creating value for the public" in order to justify more selfish agendas. These cloaked agendas may include justification for mandates and projects, the usurpation of political power, and the means of intrusion into more politicized domains.

An early articulation of this critique defined the rhetoric of public value as "the idea that managers may legitimize the exercise of discretion by showing it to be consistent with a mandate that is produced through a fair process of deliberation," (Roberts 1995, p. 291). In other words, public value as rhetoric is the accusation that public managers (bureaucrats) use the ostensibly friendly language of "value creation" to advance more surreptitious goals, which means that public value as a whole is akin to a "public relations exercise" that puts a good spin on the work of public managers and helps them to justify their budgets, their powers, and their mandates in a seemingly neutral and unalarming manner (Oakley et al. 2006).

The spectre of rhetorical strategems is deeply ingrained in public value theory, and even its founder, Mark Moore, recognized early on that public value does have a rhetorical aspect, but would need to move beyond that in order to prove truly relevant to public administration thought (Moore 1994). Forceful critiques of public value as rhetoric were put forth in the very early days of the theory's dissemination within the public administration literature. As early as 1995, critics cautioned that public managers could use public value as a form of defense for increased involvement in political decision making, after "allaying public concern about bureaucratic power" (Roberts 1995, p. 293). They further warned that public value as a rhetorical strategy "may overestimate the ability to build mandates, the ability to build deliberative processes that are manifestly fair, and the willingness of dissentient citizens to defer to such mandates" (1995, p. 291).

Since then, there has been an intermittent to-and-fro between the proponents and opponents of public value theory on just how important the rhetorical element really is in public value. The strongest opponents of public value have asserted that much of the theory is premised on and driven by rhetoric (Roberts 1995; Oakley et al. 2006), while the strongest proponents have argued that, even as rhetoric may well have some presence in the process, this does not detract materially from the essence and purpose of public value theory (Moore 1994; Alford and O'Flynn 2009; Chohan and Jacobs 2016, 2017).

The debate on public value as rhetoric is far from settled (see discussion in Chohan and Jacobs 2017). However, as it stands today, the accusation of rhetoric does contain certain implications about public administration and the role of bureaucrats that warrant a more careful examination.

## The Implications of Public Value as Rhetoric

Whether or not the accusation of public value as rhetoric is true or meaningful, there are several implications about public managers that arise from asserting thus. These implications are

examined below from the perspectives of public value theory's proponents and opponents (See also Table 1).

First, the criticism of public value as a rhetorical device implies that the theory lacks substance, because public value is then an innocuous catch-all term for the work of bureaucrats, but which fails to add precision to the normative understandings of what bureaucrats should do. By acting as a broad *portmanteau* for bureaucrats, public value generalizes the work of bureaucrats in a positive tone, without tackling the more nuanced aspects of bureaucratic engagement with the public and with other agents such as politicians. However, the generality of public value theory can be seen as both a strength and a weakness. On one hand, the broad nature of the public value discourse allows scholars to engage with multiple aspects of the public manager's role and work in a way that other theories would not allow. On the other hand, the lack of precision also generates ambiguities in the understandings of bureaucratic engagement that may be couched in rhetoric that can advance the interests of certain groups including bureaucrats. The growing literature on public value would seem to suggest that the theory does not lack substance, as scholars continue to develop its subfields in a variety of contexts.

Second, the accusation of public value as bureaucratic rhetoric implies that advocates of public value theory may encourage deception with a view to politicized ends. If public managers are using the rhetoric of public value towards self-serving agendas, then this implies that proponents of public value theory are abetting the use of bureaucrats' rhetorical stratagems towards those self-serving purposes. Opponents of public value theory would therefore make the accusation that public value's rhetoric essentially facilitates "managerial *realpolitik*" (Roberts 1995). Proponents of public value theory have responded in three different ways to this insinuation. In the first instance, they have noted that given that the value of government is inherently difficult to monetize and that the critics are mired in "private sector nostrums," which lead them to "misconstrue the notion of public value," it is in fact the critics who are employing rhetoric rather than the targets (Alford and O'Flynn 2009, p. 182). Yet this is not a particularly powerful defense. In the second instance, they have noted that insofar as there is a rhetorical element in public value theory, it is not

**Public Value and Bureaucratic Rhetoric, Table 1** Implications of public value as rhetoric

| Implication | Explanation | Counter-arguments |
|---|---|---|
| Lack of substance | Public value is a rhetorical catch-all term that lacks any real substance. | 1. Broad nature of the public value discourse allows scholars to engage with multiple aspects of the public manager's role and work<br>2. Growing literature suggests that public value is useful in a variety of contexts |
| Encourages deception | Proponents of public value theory are abetting the use of rhetorical stratagems by bureaucrats towards self-serving purposes | 1. Bureaucrats and politicians *both* employ rhetoric.<br>2. Bureaucrats and politicians must reconcile the contradictory values articulated by the public, thereby diverting resources to address some values, and rhetoric to address others.<br>3. Critics misconstrue the notion of public value through the misapplication of a private sector orientation, so the critics are themselves employing rhetoric. |
| Anti-democratic | Public managers are antidemocratic and use public value rhetoric to circumvent accountability | 1. Public value theory is not antidemocratic insofar as public managers can move beyond rhetoric and reconcile the supposed trade-off between "efficiency" and "democracy" by simultaneously fulfilling the objectives of professionalism (efficiency) and accountability (democracy) |

just public managers who can employ rhetoric, but *politicians* as well (see Chohan and Jacobs 2017). As such, the application of rhetorical ploys is not an aspect of public value relegated to the bureaucrats, but is employable by other agents as well, and should therefore not be a singular criticism of the public manager. In the third instance, they note that the use of rhetoric emerges from the need to dedicate a finite set of resources towards satiating the desires of the public, which means that bureaucrats and politicians alike need to prioritize between the values (and the needs) articulated by the public. If the public articulates competing (or contradictory) values, then the bureaucrats and politicians are forced into a position where they divert resources to some values and rhetoric to others (see Chohan and Jacobs 2016, 2017).

Third, the accusation of public value as bureaucratic rhetoric implies that public value theory possesses a staunch antidemocratic element and that public managers are antidemocratic in their orientation, since they employ the ruse of public value to circumvent accountability from politicians and from the public at large (see Rhodes and Wanna 2007). After all, bureaucrats are not "elected" into their offices by the public and are therefore not beholden to the democratic process as politicians are, since politicians can be removed as part of the regular process of an electoral system. While the notion that public value is antidemocratic is powerful and was for a long time perhaps the most potent criticism of public value theory (Rhodes and Wanna 2007; Alford and O'Flynn 2009), more recent examinations of "public value in politics" (see Chohan and Jacobs 2016) have come to disagree with the general denunciation of public value as antidemocratic. Using *Legislative Budget Offices* (LBOs), as an example, Chohan and Jacobs show how public managers can reconcile the supposed trade-off in public value between "efficiency" and "democracy." They do so by showing that LBOs can simultaneously advance both (1) efficiency, by producing superior analytical and professional work, and (2) democracy, by making politicians and other bureaucrats more transparent and accountable within the larger process. With respect to the accusation of public value as rhetoric, however, the logic behind the antidemocratic accusation continues to resound, for if the public manager aims to mitigate external scrutiny from the public and politicians, it is logical for her to deploy rhetoric as a means for obfuscating her real agenda.

## Addressing Rhetoric in Public Value

The accusation that public value can serve as a rhetorical ploy for public managers, helping them to justify their agendas and present an innocuous language for encroaching into political ambits, continues to persist in the public administration literature. Critics of public value have forcefully argued that public managers, not having been elected by the public, can use the seemingly harmless nature of public value discourse to cloak their ambitions for greater political and decision-making power, and engage in "managerial *realpolitik*" (Roberts 1995). Meanwhile, even the founder of public value, Mark Moore, had recognized that public value has a rhetorical aspect and would need to move beyond that in order to prove relevant to public administration thought (Moore 1994). This means that the accusation of public value as a rhetorical device is one that is unlikely to subside.

However, instead of seeing the issue as to-and-fro between public value theory's proponents and opponents on the fairness of this accusation, what is perhaps more enriching for the public administration literature going forward is the elaboration of more nuanced perspectives on the *manifestations* and *consequences* of rhetorical aspects in public value theory. One such elaboration has been that, contrary to the usual debate, the use of "public value as rhetoric" is not just relegated to public managers, but also extends to *politicians*, who can employ the rhetoric of public value to engage the public without undertaking actual and meaningful reform (see detailed discussion in Chohan and Jacobs 2017). Another such elaboration is that public managers have to strike a balance between the execution of mandates and the risk of recrimination from politicians and political

agents, and the rhetoric of public value can help to defuse that strain of contention (see example of Legislative Budget Offices in Chohan and Jacobs 2016).

A yet further elaboration is that politicians and public managers alike must prioritize between the different, and sometimes conflicting, values that are articulated by the public. This means that with respect to the values that are deemed of higher priority, politicians and public managers may divert resources, but with respect to other values of a lower priority, they may instead divert rhetoric (see Chohan and Jacobs 2017). The way in which politicians and public managers prioritize between values that are articulated by the public is itself an avenue of inquiry that warrants further investigation. These are but some examples of the nuances that require greater attention from scholars of public value theory, if the debate on its rhetorical aspects is to move forward.

Public value has been an area of keen interest within the broader public administration literature, but it is not without vociferous critics. The notion that it can serve as but a rhetorical device is one of the most enduring criticisms of the theory, and one that has not been singularly or conclusively repudiated. The fact that bureaucrats and other practitioners have so avidly welcomed public value theory may in itself be an indication of its rhetorical allure. As such, it is important going forward to focus on the finer and more nuanced elements of public value as a rhetorical device.

# Public Value Dynamics

Toon Kerkhoff
Faculty of Governance and Global Affairs, Institute of Public Administration, Leiden University, Leiden, The Netherlands

## Synonyms

Changing ethics; Moral development

## Definition

Public value dynamics is the change and stability in the occurrence of and meaning attributed to public values over time.

## Introduction

Administrative and political behavior that is considered good or appropriate in one context can easily be considered bad or inappropriate in another. Take, for instance, the sale of public office. While largely accepted in much of early modern Europe, this is mostly outlawed today. Another example is the practice of gift giving to public officials. It depends very much on context whether this is an acceptable form of payment, a gesture of trust, an obligatory ritual, or an act of bribery. In short, moral judgment (what is right or wrong behavior) largely depends on context of

time and place. This in turn raises the important question when and why moral judgment – and with it public morality as such – actually changes. When and why, for example, did a public office cease to be considered personal property one can buy and sell for personal gain? What actually makes a gift an act of bribery rather than a gesture of trust?

Answers to such questions can partly be found through the study of public value dynamics, defined here as the change and stability in the occurrence of and meaning attributed to public values over time. In a nutshell, since public values make up public morality, understanding when and why public values change helps in understanding the changing public morality and conceptions of "good governance" as a whole. Various scholars – in particular from the disciplines of political science, public administration, and public policy – continuously stress the importance of a well-functioning public sector; both in a managerial and a normative sense. As such they often assess the specific ethical challenges and changes in public morality that stem from changes in political-administrative decision-making, public policy, and public management. Research has, for example, focused on challenges and changes such as *New Public Management*, multilevel governance, or increased globalization and their impact on administrative ethics, public values, and integrity (cf. Lawton et al. 2016). Are public values compromised by New Public Management's business techniques of targets and performance management and one-sided attention for "the bottom line"? Does multilevel governance – in which multiple public and private actors cooperate in public service delivery – necessitate the emergence of new skills, capabilities, and values for public officials? Does globalization require new national and international approaches to values and "good governance," corruption, and anti-corruption?

In this entry the concept and study of public value dynamics will be discussed. The entry offers an overview of how scholars – mainly in the disciplines of political science, public administration, and public policy – frame their study on such topics as (changing) public morality, "good governance," and integrity in terms of public values and public value dynamics. To this end, the following first offers definitions of key concepts. Next, main theories and approaches to conceptualize and measure public value dynamics are discussed as are main empirical findings. Finally, the entry concludes with a brief assessment of the theoretical and practical relevance of continued (interdisciplinary) study of public value dynamics.

## Public Values, Public Value Systems, and Public Morality

In order to understand public value dynamics, key concepts should first be defined. A first of these is the concept of public values. While public values have been studied extensively in public policy and management research (cf. Van der Wal et al. 2015), a definition remains contested. This is mostly due to variance in the interpretation of both "values" and "public." A useful, although slightly complex, definition of values is provided by Oyserman, who sees them as "priorities, internal compasses or springboards for action – moral imperatives" [. . .] "implicit or explicit guidelines for action, general scripts framing what is sought after and what is to be avoided [. . .], social agreements about what is right, good to be cherished" (Oyserman 2001: 16148, 16150–16151). Next, Bozeman offers a useful and widely acknowledged definition of *public* – as opposed to private – values. He defines public values as "those providing normative consensus about (a) the rights, benefits and prerogatives to which citizens should (and should not) be entitled; (b) the obligations of citizens to society, the state and one another; and (c) the principles on which governments and policies should be based" (Bozeman 2007: 17).

In addition, the concepts of public value systems and public morality need to be defined, since public values are best understood as parts of larger public value systems and public morality as a whole. Firstly, a public value system consists of both values and norms. Norms are the concrete written or unwritten rules commanding or regulating social conduct, derived from the more

general values. For example, wearing a helmet while on a building site is a norm derived from the value of safety. The notion of public value dynamics (discussed below in more detail) is crucial to a public value system because a change in the meaning or occurrence of one value is likely to be affected by change in or occurrence of another value. For example, one's understanding of *justice* is likely to have an impact on one's understanding of *legitimacy* and vice versa. Public value systems are systems of criteria (values and norms) in society by which public behavior is judged, and sanctions are applied. Of course, different systems can coexist simultaneously, adding to the difficulty of assessing changing meaning in or occurrence of public values. For instance, parts of society might defend public values and value systems which others fiercely oppose. The latter, finally, points to the important and related concept of public morality. This can be defined as the totality of – potentially opposing or separated – values and/or value systems held by individuals or groups in a society. Public morality is therefore about the totality of views (and values) on right or wrong in society, how life should be lived, and what people in the public sphere should and should not do. As such, it is subject to change and variation as well.

## Public Value Dynamics

With aforementioned definitions in mind, the concept of (public value) *dynamics* still remains to be discussed. Public value dynamics has been defined earlier as the change and stability in the occurrence of and meaning attributed to public values over time. For a proper understanding, this definition needs to be broken up in parts. These parts are, first, change and stability in the occurrence of public values and, second, the attribution of meaning to public values over time.

### Change and Stability in the Occurrence of Public Values

The notion of change and stability in the occurrence of public values points to the possibility that public values can be common in one time, but nonexistent or hidden in another. Values might simply be around for long periods while not being used or emphasized in equal fashion during this time. Public value dynamics considers, for instance, whether values are dormant at one stage, reappear in another, or disappear entirely. An example is the value of "honor." While nearly omnipresent in ancient, medieval, and Renaissance "mirrors for princes" (in which rulers were instructed on proper behavior and good rule), one would be hard-pressed to find this value in today's equivalent of codes of conduct. Such "coming and going" of values over time is a core part of public value dynamics (see below). Closely related is the notion that public value dynamics is also about a change in relations between public values. Essentially this revolves around the question how a stronger emphasis on or introduction of value X might affect values Y and Z, which also has a bearing on both the occurrence and the meaning (see below) of public values. For example, a strong emphasis on the value of "innovation" in public policy might lead to a stronger adherence to other values such as "participation" by and "equality" of employees in the design of this policy.

### The Attribution of Meaning to Public Values Over Time

It has previously been suggested that the meaning or interpretation of a term (or, in this case, a value) can differ per person, group, and context of time and place. A brief look at a specific strand in the philosophy of language is important to grasp how meaning might be assigned to values and, therefore, how meaning tends to change. Following the work of Ferdinand de Saussure (1857–1913) – and his differentiation of terms in *signifiant* and *signifié*, known more widely as denotation and connotation – one can distinguish the concrete shape or word that refers to some object in reality (*signifiant* or denotation) from the mental concept which that *signifiant* refers to (the *signifié* or connotation). Importantly, the connotation is determined by time, language user, and context. As such, values might have been around as a *signifiant* for centuries but might also have acquired a different *signifié* over time. Take, for

instance, the value of accountability. This might have meant something different to a twentieth century Englishman or a twentieth century Bulgarian, considering the fact that the Bulgarian was raised and educated in communism and the Englishman in a liberal democracy. After all, in the first system, a civil servant might, for instance, have been accountable first and foremost to the communist party and in the second to the minister and/or parliament. To who or what public servants are to be accountable matters for the meaning of the term. In one system political actors are held accountable for their actions to the electorate. In another, the electorate might be replaced by a politicians' political party or his or her family relations. In short, values are likely to have different connotations in different systems. A different context can easily lead to a different meaning and interpretation of the same value.

Like de Saussure's, other scholars in the philosophy of language are important to help one understand the aspect of attributing meaning to public values in public value dynamics. The early Wittgenstein (1889–1951) or Peter Winch (1926–1997) has, most notably, emphasized how the meaning of a term is enclosed in its use. Related to this is the work by Quentin Skinner (1940–1979) on the idea of "speech acts." Skinner emphasized that all text has to be understood in its linguistic and ideological context. It is only the conventions of a specific time and place which determine the *pointe*, or "intended significance" (cf. de Saussure's *signifié* or connotation) of a term. To return to previous examples, the understanding of "honor" or "being honorable" therefore depends on when you ask someone and who you ask. Stepping down by a politician because of mistakes made can either be seen as the "honorable" thing to do or as an "easy way out" to avoid public debate (and accountability). Likewise, a politician staying on under the pretense of claiming that s(he) wants to rectify mistakes made can either be applauded as a true leader or as a schemer, simply trying to stay in power. To conclude, while being the same words, some values can come to mean quite different things and related norms and value judgments on right or wrong behavior then differ accordingly. A gift to a public official might, for instance, not be considered an act of corruption precisely because of a different meaning attributed to accountability. Naturally, the aforementioned also applies to other public values, such as "representation," "integrity," "justice," or "efficiency," to name but a few.

## Conceptualizing and Measuring Public Value Dynamics: Theories and Results

As already became apparent from the previous, whatever is considered "good" administrative behavior is constantly reevaluated, reinterpreted, and redefined in a complicated and potentially volatile social and political setting. Because of the complexities of the public sphere, of administrative behavior, and of attributing meaning to behavior and values, it is imperative that scholars of politics, public administration, and public policy use insights from other disciplines to study public value dynamics. Useful insights have come from philosophers of language who look at language and meaning, from historians who pay attention to the historical development of ideas and political institutions, from sociologists and anthropologists who examine socially acceptable behavior, and from political economists who look at decision-making or, quite literally, the valuing of one thing over another in a context of scarce resources and opposing political agendas. While much could still be done to improve the interdisciplinary nature of research on public value dynamics, the topic can only be approached in such a way. For these reasons, the following section presents an overview of the main theories and approaches that can be used to conceptualize and measure public value dynamics and that can or should be a part of such an interdisciplinary effort. Main empirical findings and conclusions so far are discussed in the process.

### Historical Approaches

Studying public value dynamics can be considered inherently historical since it deals specifically with time, context, and change and continuity. Examples of explicit use of history and historical

methods to investigate public value dynamics are relatively scarce but out there (cf. Kerkhoff and Wagenaar 2016). One outlet is to be found in explicit historical approaches offered by public administration and political science scholars who focus on public debates on corruption to assess public value dynamics. With a historical comparative perspective, some scholars have attempted to lay bare large-scale and lengthy but slow-moving processes of changing public values. A key conclusion from such work concerns the importance of path dependence, which stresses that present public value systems are largely defined and shaped by the past course of events and past decisions. This is useful for policy analysis, for instance, since knowledge of the long-term historical development of a particular policy helps one better understand and weigh current problems as well as appropriate solutions. Furthermore, historical work on public value dynamics shows one cannot change matters all that easily or quickly. Instead, public values and public morality change as a result of decades if not centuries of historical institutional development. Ramifications of this are many. For example, one should not expect very quick results when advocating or implementing moral reform (such as through codes of conduct) and one-size-fits-all anti-corruption policy which is too often focused on the present alone. Likewise, historically inspired work on so-called administrative traditions has been instrumental in explaining how present-day national public value systems underlying politics and administration have been created in long and peculiar histories of institutional development.

Historical approaches to public value dynamics have also been useful to understand the complicated interplay between incrementalism and critical junctures in processes of public value dynamics. From this perspective, public value systems are gradually and incrementally built up over relatively long periods of time, in small steps of constant readjustment. However, sometimes – as some historians and public policy scholars contend – these gradual motions are interrupted by certain "fast" or "sudden" periods, events, or crises in history that are supposedly crucial in changing social and political processes, including public value dynamics. One such scholar, famously, was Reinhart Koselleck who noted the importance of a so-called European *Sattelzeit* between 1750 and 1850 as a key period of change in which political concepts (and public values) acquired radical new meaning. Similarly, one can see how long-running and seemingly dead-end conversations about public morality are likely to be pushed forward by extreme events such as a major crisis of war or sharp economic decline.

Yet more historical approaches have been useful to come to terms with the difficulty of establishing causality in public value dynamics. For instance, one important realization from historically inspired research in political science has been that a direct link between changing institutions (for instance, the emergence of a parliament and elected representatives) and changing or emerging public values (for instance, popular sovereignty and representation) is difficult if not impossible to establish. Historical research shows that causal chains (including those suggested in various theories on public value dynamics, see below) are often not straightforward, in a direct line from X to Y. Rather, it is the case that X triggers sequence a, b, and/or c which yields Y. Because of the strong emphasis on context and time, this offers a more realistic – if also more complex – image of causality in public value dynamics. Historical approaches are useful to also point to unintentional events, emotions, and sheer luck in political-administrative development rather than reason and intention. This counterweights scholars who, for instance, ask what kind of organizational structure is likely to safeguard value X and thereby clearly adopt the idea of intentional value change. To be sure the problem (impossibility?) of determining the direction and nature of causation should not lead one to ignore the question of public value dynamics altogether. While it remains an important realization, it should not preclude a search for processes and mechanisms of change of public values nonetheless.

### Axiological Approaches

A second approach that is of interest to understand public value dynamics is connected to axiology: the (philosophical) study of values. Values are interconnected elements of wider public value systems (see above), which often conflict in

political-administrative decision-making. Consider, for instance, "liberty" versus "equality," "mercy" versus "justice," or "love" versus "impartiality." Given the usual absence of common ground on which to base a choice for one value over the other and given the lack of consensus on the importance of specific values, discussions among public administration, political science, and public policy, scholars also focus on useful categorizations (by means of ordering, arranging, ranking) of public values (cf. Rutgers 2008). One such categorization is by Montgomery Van Wart, between personal, professional, organizational, legal, and "public" values. Another example is Christopher Hood's distinction between lambda, theta, and sigma values.

Categorizations of values are usually based on empirical research of values found in literature on the topic (by way of literature study) or in the practice of administration (by way of surveys or questionnaires). A key article by Beck Jørgensen and Bozeman (2007) was distinguished between 72 values in public administration literature which they categorized in sets. The values "accountability" and "responsiveness" were, for instance, part of a value set in the category called "relationships between public administrators and politicians." Many other attempts at categorization of values can be found. Naturally, this is related to public value dynamics since values are constantly categorized in a different way and "move around" in public value systems. Work that attempts to understand the "coming and going" of values in value systems therefore assesses how important certain public values are. Other work explores acts of balancing different and potentially conflicting values and so-called public value trade-offs. While many such overviews do not themselves provide more than snapshots of public values and value conflicts at certain moments or periods in time, taken together they offer a basis for more research on and knowledge of public value dynamics over longer periods of time.

## Public Organization Theory and Public Management Approaches

A third and final approach (or rather, cluster of approaches and theories) which is useful to conceptualize and measure public value dynamics is to be found in scholarship on public organization theory and public management. Some studies have asked how contextual change challenges existing values and how a quest for new values or changed value profiles can be dealt with by different types of change mechanisms. Different so-called change mechanisms have been suggested in a key article by Beck Jørgensen and Vrangbæk (2011). One mechanism is *teleological* or intentional value change. Here, research has shown how people in organizations opt to emphasize a certain value for strategic purposes in codes of conduct, mission statements, and other official documents relating to the organization. Another mechanism is focused on *conflict* which arises when different values collide. In such a view, the opposition of and clashes between values and their carriers (individuals or institutions) partly determine value dynamics. For example, a difference of opinion about what is important between management and workforce results in clashes and conflict which can trigger organizational responses to go for value X rather than value Y. A final change mechanism is *value internal*. Here values may change in and of themselves or develop in life cycles or as fashion trends as elaborated upon below.

Organization and public management scholarship have also assessed how the type and scope of value changes can be conceptualized. This offers an insight into how lasting value change is, how deep value change has penetrated in a public organization, and how many public organizations or sectors have been affected by value change. Different hypotheses and interesting initial empirical results can be found. One is the crowding out hypothesis, where "old" values are supposedly replaced or pushed out by "new" values. For example, a more businesslike approach to public management might lead one to favor the value of "efficiency" at the expense of another (opposing or contradicting) value such as "due process." Instead of crowding out, research has shown that different values simply appear in different phases of public policy (see above). Also, the supposed threat of private values pushing public values out seems as yet mostly a theoretical idea rather than an empirically proven fact. This matter arguably deserves more attention. While some scholars have presented the idea that different systems

(such as market and law) follow separate and possibly opposing or conflicting dynamic patterns of value change, others remain skeptical.

Other hypotheses are equally interesting. One of these concerns the notion of value sedimentation which posits that long-living organizations and societies may consist of several layers of values. Old values are, for instance, no longer emphasized but may still be around under the surface. Likewise, some values might be very much "alive" in some parts of an organization while being "dead" in others. Management and employees might hold very different values. The same could be said for the public relations and finance departments of a public organization. Research has noted different levels of public value change where public values change at a different pace on each level. Sometimes it is suggested there is a distinction between a fluid "play of the game" level on the one hand and a level of more "embeddedness" on the other, where informal institutions, customs, traditions, norms, and religion influence evolving, changing values and value systems. Similarly, one can imagine a core-periphery movement, in which value systems are visualized as onions: a deep core of basic and long-lasting beliefs, a policy core of sector/policy-specific values shared by members of a certain coalition, and a third layer of less deeply rooted beliefs pertaining to specific policy instruments or operational arrangements.

Such work closely deals with visibility which may be linked to dominant values overriding non-dominant values in unequal sociopolitical settings and/or the possibility of a different pace of change. Some values (at the periphery of an organization) might be more visible and less dominant and might therefore change faster. Others (at the heart of an organization) may be less visible and more dominant and then change occurs at a slower pace. Visibility, dominance, and pace of change are crucial elements in the study of public value dynamics. Useful examples are offered by scholars of organizational culture (after all, consisting in large part of values) such as Edgar Schein, who conceptualized organizational culture as consisting of artifacts (such as a logo or a uniform), basic values (such as hierarchy), and internalized assumptions (lower echelons are not expected to partake in deliberations on policy), respectively, moving from more to less visible and from more to less changeable. These and other studies offer the important realization that not every value is as easily changed and that the level of institutionalization or "embeddedness" matters for the establishment and penetration of values into the core of an organization or society. Related as well is the hypothesis that suggests a potential "division of labor" between values. Here, certain public values might arrive together with new (organizational or public) tasks and move to the background once that task has been completed. When considering phases of organization or project development, it becomes apparent from research that some values are more emphasized in the beginning, middle, or end of a process. In the process of public-private partnership projects – for instance, where a private contractor is hired by the government to build a road – the values of "sustainability" and "economic development" seem most important in the beginning of the process. As the project develops, however, other values (such as efficiency, transparency, and democracy) become more important, for instance, to gain trust from various stakeholders.

Similar to the idea of "division of labor" is the thought that public values move in "life cycles" with "time lags" or "pendulum shifts." Values might appear and disappear every few years, decades, or centuries, in accordance with certain institutional arrangements or social processes. Earlier, the example of "honor" was mentioned. Likewise, values such as "frugality," "equality," or "temperance" might reappear or be more emphasized in times of (perceived) economic decline. This also has to do with the idea that some values simply become "fashionable," for instance, by looking at other contexts and copying what happens elsewhere. Processes of isomorphism are sometimes at play here where organizations (and their values) gradually become similar. Life cycles also form an important element in work reminiscent of organization and population ecology on the rise and fall or birth, aging, and death in and of organizations. Here it is also argued that different values become important in different phases of organizational development. Classic work by Anthony Downs in the late 1960s already showed how bureaucracies tend to

emphasize different values as the organization grows older and bigger. Related is work that explains public value dynamics by looking at different parts or phases of the political-administrative decision-making process.

## Conclusion

In this entry, definitions of core concepts surrounding and including public value dynamics have been offered and explained. Furthermore, various approaches have been discussed that are common to the study of public value dynamics. From the overview it has become apparent that many different scholars are working on public value dynamics and changing public morality – although they do not always call it as such. The overview has also underlined that work on public value dynamics is and/or should be an inherently interdisciplinary affair. Since public values and their dynamics are such complex social phenomena, it seems imperative to use insights from a wide range of disciplines and to move back and forth between useful theoretical debates and practical guidance.

While work on public value dynamics has therefore undoubtedly already yielded interesting results that link theory and practice in a meaningful way, the study of public value dynamics in politics, public administration, and public policy studies as yet remains an emerging area of scholarship. As the field is constantly in motion, some major questions will remain on the agenda in times to come. Four questions seem especially relevant. First, it seems imperative to continue to question the practical validity of the various theories and approaches mentioned in this entry. What is needed is more empirical testing – which might of course lead to yet more theorizing as well. Second, the question remains whether change in morality is a linear (or even teleological) or a cyclical process. Is public value dynamics a straightforward process from one stage to the next "without looking back" or is it a cyclical, incremental, and constantly repeating process? More can and should be done to investigate this issue.

A third key question is whether – and if so how – public values can actually influence behavior, since the latter can of course be influenced by many factors other than values. A fourth and final key question is whether one can establish the causal direction of public value change and whether it makes sense to look for causality at all. Are institutional arrangements (such as rules and new organizations), for instance, necessary and/or sufficient causes for changes in public values and public value systems, does it work the other way around or is it a mixture of both?

Discussions of these questions have a tendency to derail into "chicken-and-egg" squabbling. Rather than going in circles, it seems better not to look for "hard" causality or direct linear influences. Instead, one can adopt a more pragmatic and realistic perspective, as well as offer better conceptual understandings, to solve practical issues in light of increasing value pluralism and value conflict. Issues of causality notwithstanding, more in-depth knowledge on the complicated workings of public value dynamics remains important for the systematic clarification of public values and change therein. Further study of public value dynamics should serve to explain how one might institutionalize changes in public morality in new governance settings. It can show how changing public values can be related to socialization, organizational behavior, administrative culture, public service motivation, and ethical leadership. To be sure, in the quest to find ethical bearings in society and its administration, it is important to keep looking for meaningful relations between changing public values and a changing environment to elucidate current problems faced by public managers and politicians alike. Essentially, knowledge of changing public morality and public value dynamics helps trace the origins of key normative ideas in many societies concerning good government. It is therefore of continuous importance to understand the most basic foundations of social, political, and administrative interaction in different contexts in the past and present.

# Public Value: Bureaucrats Versus Politicians

Usman W. Chohan
UNSW Canberra, Business School, University of New South Wales, Canberra, ACT, Australia

## Synonyms

Bureaucratic initiative; Civic discovery; Criticisms of public value; Politics-administration dichotomy

## Definition

"Public value in politics" refers to the question of the degree to which bureaucrats, in an effort to create value for the public, assume mandates that might otherwise be deferred to politicians and then examines the tensions, consequences, and solutions to the tussle between bureaucrats and politicians in that value creation effort.

## Bureaucrats Versus Politicians in Public Value

The theory of public value is premised on the co-creation of value by three social elements: politicians, public managers (bureaucrats), and citizens (Moore 1994; Moore and Khagram 2004). The theory draws on a normative approach to assert that (1) the process by which value is created by and for society depends on the mutual interaction between these elements, and (2) there are synergies to be realized by such interaction.

However, the sense of co-creation between these elements raises a simmering question that is the subject of considerable controversy and debate and represents one of the core criticisms of public value theory among scholars. It pertains to the relationship between two of the aforementioned elements, the public managers and the politicians, and can be phrased as follows: as both politicians and public managers work toward co-creating value, where does the mandate of one end and the other begin? Or to put it more precisely, what is the degree to which public managers should be involved in mandates that can be deferred to politicians?

This is a question about the nature of bureaucracy in democratic societies, and one that is not just relegated to public value theory, in the sense that all thinkers of bureaucracy have had to grapple with questions of bureaucratic power. However, public value theory faces a particularly strident bent of criticism on this point of "bureaucrats versus politicians," given that (1) the theory has been touted as "the next big thing in public management" (Talbot 2009, p. 167) and because (2) it is a theory of public administration that has

emerged in a post-Cold War world where liberal democracy is heralded as the best arrangement of society, leading the "politics-administration dichotomy" (Chohan 2017), which is to say the tension between democratically elected politicians versus the bureaucratic experts, to come into heightened focus. In fact, "public value in politics" has been described as the "most contentious iteration of the public value debate" (Chohan and Jacobs 2016).

The emergence and persistence of this criticism are explained by two fundamental aspects about the legitimacy of bureaucracies. On one hand, bureaucrats derive legitimacy from the fact that they are the experts in their respective fields, with an intimate knowledge of the subject matter far surpassing that of politicians, and this becomes all the more true for complex affairs such as inter alia the budget process (see Chohan and Jacobs 2016; Chohan 2017), national security, urban planning, healthcare, agriculture, financial market regulation, pensions, and social security. On the other hand, bureaucrats are not elected into office, and so are not beholden to the public in the sense that politicians are, with their accountability processes being more distant and remote, sometimes excessively so. They may indeed pursue agendas that are internally driven, including the maximization of their budgets and mandates for reasons including remuneration, power, and prestige. As such, the advantage of public managers as the "experts" is partially counteracted by the need for holding them accountable.

This problem is mirrored in two aspects of the legitimacy of politicians. On one hand, they are directly beholden to the public (or at least nominally so), and are held to account repeatedly and frequently, for they can be and sometimes indeed are removed from office. On the other hand, politicians do not necessarily possess the subject matter expertise to deal with their portfolios and mandates to the degree that public managers do. As such, politicians wield a public mandate entrusted through an electoral process, but require the cooperation of public managers for expert-led advice, and a more comprehensive knowledge of their areas of focus, not to mention for the actual execution of policy programs.

In sum, there are complementary considerations that can impel bureaucrats and politicians to work together, but there is also a simmering tension between the two in the need for power over actual decision-making and policy implementation. This is a quandary that public value theory, as with all other streams of public administration thought, must address.

## Reconciling "Efficiency" and "Democracy"

Public value theory's original response to this quandary was to place public managers in a position subservient to politicians. The founder of public value, Mark Moore, described politicians as the "final arbiters" of public value (1995, p. 38), giving them the primacy in public value creation. However, this statement was made with the qualification that "political decision-making is vulnerable to many kinds of corruption" and that "these well-known difficulties can and do affect the moral claims of political decision-making on the conduct of government in the eyes of both citizens and managers" (1995, pp. 54–55).

As the appeal of public value theory grew, particularly among practitioners (public managers), the question of political involvement by public managers was sidestepped and not directly engaged for many years (see also Table 1). However, scholars began to return to the question more proactively as views among them regarding public value's salience and comprehensiveness began to significantly diverge. The balancing act between allocating greater powers to public managers or politicians was thus described as a fundamental trade-off between "efficiency" and "democracy" (Stoker 2006, p. 43). Since then, however, harsher criticisms of public value theory have emerged, with some academics describing public value as an inherently "nondemocratic notion" (see Rhodes and Wanna 2007, p. 408), because greater

**Public Value: Bureaucrats Versus Politicians, Table 1** Brief timeline of discourse on "public value in politics"

| Time | Research | Author(s) |
|---|---|---|
| 1990s | Public value theory is proposed | Moore (1994, 1995) |
| | Politicians are recognized as the "final arbiters" in public value | |
| 2006 | Balancing act between "efficiency" and "democracy" noted | Stoker (2006) |
| 2007 | Public value explicitly denounced as "nondemocratic" | Rhodes and Wanna (2007) |
| 2009 | Politicians v. public managers identified as one of the most pressing and salient criticisms of public value | Alford and O'Flynn (2009), Talbot (2009) |
| | Public value lauded as "next big thing in public management" | |
| 2016 | Public managers shown to enhance "efficiency" and "democracy" simultaneously through example of Legislative Budget Offices | Chohan and Jacobs (2016) |
| 2017 | "Politics-administration dichotomy" revisited and addressed through example of Legislative Budget Offices | Chohan (2017) |

powers for public managers represented, for these scholars, an outright usurpation of power and thus a trend toward suppressing democratic processes.

However, more recent examinations of "public value in politics" have taken much more nuanced perspectives and have even demonstrated that, in some instances, public managers can enhance *both* the level of efficiency and democracy. For example, Chohan and Jacobs (2016) use the lens of the Legislative Budget Office (LBO), to show that public managers can (1) increase efficiency, by providing more accurate and rigorous budgetary analysis that is transparent and nonpartisan, and (2) increase democracy, by improving the level of transparency and accountability in the budget process, through the simplification and open dissemination of budget analysis. Such recent works help to mitigate the impulse toward outright and total denunciations of public value as a "nondemocratic notion," but further research is required to elaborate on the ways through, and instances in, which public managers succeed in enhancing both "efficiency" and "democracy."

## The Post-Truth Era: Implications for Bureaucrats Versus Politicians

As mentioned earlier, public value is criticized particularly harshly with respect to the "politics-administration dichotomy," given that it is a product of post-Cold War era beliefs, when liberal democracies were being heralded as the best practicable social arrangement. However, the very recent events of Brexit in the United Kingdom (2016–), the ascent of the Far Right in Eastern and Central Europe (2013–), and, above all, the election of Donald Trump in the United States (2016–) are collectively casting a new, seething, and derisory light on the assumption that the primacy of liberal democracies is either (Alford and O'Flynn 2009) sustainable, given the disruptions from radical parties and ideologies within the West, or even (Chohan and Jacobs 2016) desirable, as expressed in terms of growing numbers of votes cast for these parties and ideologies.

These events are generally subsumed within the term "post-Truth era," which alludes to the fact that impartial expertise, and "experts" in general, do not wield the same currency or legitimacy that they once did (Chohan 2017). This creates serious problems, not just for politicians who promote socially inclusive agendas, but even more so for public managers, as (Alford and O'Flynn 2009) more and more of the public adopts a derisory attitude toward the experts, and (Chohan and Jacobs 2016) politicians can reap electoral dividends by demonstrating condemnatory attitudes toward these experts.

While this may allude to the demise of the "expert" and an ostensible conclusion to the

"politics-administration dichotomy" in favor of the anti-bureaucratic and anti-intellectual demagogue, it may also portend the revitalization of the public manager's role. Future research by scholars of public administration may find this avenue ripe for inquiry. In a post-Truth era, there may be room for the public manager to reassert her expertise and her commitment to impartial analysis. But beyond this, it may also create room for the ambitious public manager to co-opt more of the policy initiative, very likely in surreptitious ways, while the politicians thrive on feeding rhetoric to the public. Future research may engage with such situations, where the public manager may drive more practical and implementation-based strategies toward gaining her foothold in politics in a less overtly obtrusive manner, while politicians continue to resort to rhetorical ploys to engage the public.

With such sociopolitical transformations underway, future public administration research on public value may consider the relevance of public managers to fields as diverse as inter alia environmental protection, defense and national security, financial market regulation, international relations, police powers, anti-narcotic policy, and public finance (budgeting). Chohan (2017) uses the example of Legislative Budget Offices (LBOs) to illustrate the case for expertise, or more specifically for "public value in politics," in a post-Truth era. This work cites the example of the Congressional Budget Office (CBO) in the United States as an example of public managers (economists) who are playing an ever more important public role as the Trump administration resorts to a mix of rhetorical gambits and populist ploys, while engaging in the destruction of public value through policies such as the attempt to repeal and replace the *Affordable Health Care Act* ("Obamacare"). The CBO's nonpartisan analysis has shown that repealing and replacing Obamacare would leave tens of millions of Americans without adequate healthcare coverage, and their analysis has formed the basis for an active resistance not just from the public, but from politicians on both sides of the aisle. As such, the CBO's example shows that public managers have not just an important role in politics in a post-Truth era, but in fact may find themselves thrust into that public value creating role more than ever (Chohan 2017).

## Conclusion

The simmering tension between public administrators and politicians is a long-standing one, and one that all theories of public management must address to some degree. In public value theory, the original primacy was accorded to the politicians (Moore 1995), but with the recognition that politicians face numerous drawbacks and shortcomings as well. As noted earlier in this chapter, there is a mirror image reflected in the deficiencies of bureaucrats and politicians: for while public managers wield expertise but limited accountability, politicians are democratically entrusted to make decisions for which they lack expertise.

While this creates room for mutual cooperation, the bureaucrat may find herself encroaching upon the politician's mandate, and vice versa, which creates a seemingly interminable power tussle. This was characterized as a trade-off in public value theory between "efficiency" and "democracy" (Stoker 2006) and was even pushed to descriptions of public value as a categorically "nondemocratic notion" (Rhodes and Wanna 2007). However, more recent examinations of the question have shown that, in some instances, public managers may enhance both "efficiency" and "democracy" (Chohan and Jacobs 2016) which reiterates the need for future research on the ways and means by which public managers can do so.

Public value theory has been constructed with a view to situating public managers in a context that is Western and founded on the precepts of liberal democracies. As mentioned earlier, there are transformations within the politics of Western countries that are themselves questioning the legitimacy of this order and the assumptions that underpin it. Beyond this, however, given that public value theory is focused on Western countries, future research must examine the normative roles of public managers, particularly vis-à-vis politicians, in non-Western contexts. This is to

say that, in research on other societies, including post-Communist, post-Colonial, "Third World," etc., there is a glaring gap in the literature on public value, specifically with respect to the power relationships, and processes of negotiation and interaction between bureaucrats and politicians, that must be addressed by scholars in the years to come.

"Public value in politics" has been described as the "most contentious iteration of the public value debate" (Chohan and Jacobs 2016). In fact, for public administration more broadly, the tension between politicians and bureaucrats lies "at the very heart of the discipline" (Chohan 2017), which is why it is unlikely that the debate, even as it becomes more nuanced and precise, is ever to subside.

## Synonyms

Beliefs; Core values; Philosophy; Principles

## Definition

The philosophical foundation of an organization that reinforces behavior, decision-making, and overall culture

## Introduction

General principles which can be used to describe a person, profession, or organization may be referred to as core values. Values provide a philosophical guide to a code of conduct and help organizations determine what is right from what is fast, fun, or easy. They are designed to be such a part of the fabric, or makeup, of the company that they remain steadfast through the years. Broadly applied, they reinforce an organization's culture, shape the vision for the future, and guide decision-making. Applied at the micro level, they serve to underpin how work is performed, how employees interact with each other, and how they serve their customers.

Research has shown that the attention given to public service values is increasing (Kernaghan 2003; Molina and McKeown 2012). Scholars hold that public and private organizations benefit both internally and externally when they prescribe to a set of core values (Peterson 2013; Ott 1989; Kernaghan 2003). While literature does not identify a consistent list of values that should be applied, a set of value *types* has gained support over the years (Molina and McKeown 2012). This chapter will discuss the importance that has been

placed on values in professional public administration degree programs, how core values can influence public organizations, and which values have been promoted as the standard for public service.

## Design of Public Administration

With the election of President Jackson in 1828, the spoils system, political corruption, and patronage became the norm. However, when the government expanded into new and diverse service areas after the Civil War, the American people called for more accountable and professional representation. Citizens no longer accepted poor congressional oversight, lack of citizen involvement, and the hiring of unqualified personnel. In 1883, Congress passed the Pendleton Act which established a Civil Service Commission. This new Commission was charged with creating a more professional, qualified, and nonpartisan civil service through merit-based hiring and promotion regulations.

As the government took steps to reform itself, a new field of study began to emerge that also supported the professionalization of public service and a civil service free of political manipulation. Lead by Professor Woodrow Wilson of Bryn Mawr College, the science of administration argued for a clear delineation of politics from day-to-day administrative duties. Wilson explained that the "field of administration is the field of business, it is removed from the hurry and strife of politics, and that administration lies outside the proper sphere of politics" (Wilson 1887, p. 18 and 210). This separation is known as the politics-administration dichotomy, and the extent to which the two can, and should, interact has been argued since its inception. One conundrum the dichotomy debate presents here is how the presence and influence of values effect public positions which need to maintain political and policy neutrality.

## Evolution of Values in the Public Administration Field of Study

In an ironic twist, possibly due to the proliferation of public administration programs in colleges, administrators are now armed with a vast amount of technical knowledge and have evolved into roles of trusted political advisors. It is not uncommon for city managers, and even those at the department director level, to work closely with mayors and council members to lobby for new policies and policy changes. This is contrary to Wilson's design and is the root cause for the need to reinforce appropriate behavior (Goss 1996; Frederickson 1993). In an effort to stem this administrative role creep, the Ethics in Government Act was passed in 1978, and the US Office of Government Ethics was created. Among its responsibilities were to issue rules and regulations about ethical conduct, monitor organizational policies, and provide training (5 USCS 101). As was done nearly 100 years prior, practice was also promoted in theory. Universities introduced ethics courses in public administration curriculums across the country to better arm future civil servants with the tools to rise above political pressures.

The term "values" also began to gain recognition during this time due to the influence of private sector business models on public sector organizations. While some interchange the terms "values" and "ethics," they do not mean the same thing. Values have been defined "enduring beliefs that influence the choices we make among available means or ends" (Rokeach 1973, p. 5). He also stated that "once a value is internalized it becomes, consciously or unconsciously, a standard or criterion for guiding action, for developing and maintaining attitudes toward relevant objects and situations" (Rokeach 1968, p. 16).

An organization's success is linked to its culture, and values are the very fabric of culture. As such, lofty documents like mission statements, strategic plans, and vision policies proclaim an organization's values and provide a philosophical direction for action and decision-making which builds the culture. Ethics, by comparison, deals with what is right and wrong, what is good and bad, and what is virtuous and non-virtuous. Ethics are focused more at the micro level and guide actions via regulations such as standard operating procedures, employee policies, ordinances, and laws.

Recognizing this difference and emphasizing the growing importance of values in the public

administration field, the National Association of Schools of Public Affairs and Administration (NASPAA) adopted new accreditation standards in 2009 which prominently feature the instruction of public service values in college curriculums. Specifically, "NASPAA expects an accredited program to be explicit about the public service values to which it gives priority; to clarify the ways in which it embeds these values in its internal governance; and to demonstrate that its students learn the tools and competencies to apply and take these values into consideration in their professional activities" (Molina and McKeown 2012, pp. 375–376).

## Value Categories Identified

While a definitive set of public sector values has yet to be determined, a field of four broad categories has been established in the industry. These categories, and the eight specific values contained therein, are consistent with NASPAA direction to emphasize values in higher education classrooms. Although each value may not resonate universally, the categories provide standards by which values can be developed and similarities can be seen across in public sector organizations in the country.

Through a series of interviews and in-depth examinations of value statements, Kernaghan sorted public service values into ethical, democratic, professional, and people categories (Kernaghan 1994). The supporting values for each category are listed below.

### Ethical

Integrity, fairness, accountability, loyalty, excellence, respect, honesty, and probity

### Democratic

Rule of law, neutrality, accountability, loyalty, openness, responsiveness, representativeness, and legality

### Professional

Effectiveness, efficiency, service, leadership, excellence, innovation, quality, and creativity

### People

Caring, fairness, tolerance, decency, compassion, courage, benevolence, and humanity

The groups reflect a combination of conventional public sector values with principles generally attributed to private sector companies (Kernaghan 2003). The history of public administration and public service can also be seen in the specific values that have been identified. From these categories, one can glean the strife and types of challenges that were prevalent in all levels of the public sector, the areas of importance that have been emphasized over the years, and the intended direction for the future of this profession.

Just a simple Internet search reveals that the types of values espoused by public sector organizations across the country are in line with what Kernaghan has identified and what is supported by NASPAA. For example, the City of Pasadena lists its values as responsiveness, innovation, diversity, and inclusiveness (http://cityofpasadena.net). The Olathe, Kansas Police Department, values integrity, accountability, service, and respect (http://www.olatheks.org/Police). And the City of Naperville boasts a group of core values made up of people, respect, pride, and trust (www.naperville.il.us).

An organization can create its set of values through a number of methods, including, but not limited to, a series of formal workshops with the governing board, leadership mandate, and employee surveys. Values can also develop organically through leadership and employee behavior. Regardless of how values come to be, they are designed to be steadfast and reliable over time. However, they are not immutable. Values that guided an organization decades ago may not be the same ones that provide direction today. Just like in the private sector, legislative priorities change, and new leadership comes and brings with it new goals and new ideas. Public sector organizations must evolve, respond to societal changes, and provide services that the customers want in the manner that is most convenient.

One obvious change in public sector values is the emphasis on innovation. The days of standing in line for permits, calling city hall for information, or even addressing your city councilman are becoming numbered. Citizens are busy,

commutes are long, and people value their time. They are increasingly mobile and have become skilled multitaskers. Public sector organizations must be nimble to meet the demands of its customers. As such, municipalities and other public sector groups are availing themselves to technology solutions that allow businesses, residents, and students to conduct business on their time. A motto that is gaining popularity among municipal organizations which reflects this shift to be creative in the way services are delivered is "online, not in line."

## Benefits of Values in the Public Sector Organization

Values are at the heart of an organization's culture and can be recognized in artifacts, language, behavior, procedures, and legislation. Because they are prevalent and far-reaching, it is imperative that they accurately reflect the beliefs and philosophy of the organization. When values and behavior are incongruent, the mission of the organization may be placed in jeopardy. However, when they align, internal and external benefits can be realized.

This is most notably seen by observing those in power. The success of an organization is inextricably linked to the values exhibited by those in leadership roles. Employee performance is high when behavior is in sync with values. Staff is more engaged, trusting, and loyal when leaders strive to adhere to the values that have been established. When values are not reflected by the leadership, it is time for the leadership to change.

When an organization publically announces its core values, residents, businesses, and employees can hold it accountable for its behaviors. Some public sector organizations choose to combine mission and values, but there is a subtle distinction. An organization's mission statement clearly and succinctly states the purpose of an organization. An organization's values identify how it will fulfill its mission. For example, the mission statement of the City of Naperville is "to provide services that ensure a high quality of life for our residents and a dynamic environment for our business community through collaboration, innovation and sound fiscal management" (www.naperville.il.us). Here, it can be seen that the City of Naperville is emphasizing a blend of traditional (fiscal management or accountability) and new values (innovation).

Values also help to clarify the organization's brand to current and potential residents, developers, and retailers. For example, municipalities that encourage innovation and creativity may attract more tech companies and start-up businesses. In areas that value community spirit, volunteerism, and service, one may see a prevalence of social programs aimed at adolescents, seniors, and improvements to accessibility. Likewise, more special events such as festivals, parades, and races may be popular.

Decision-making is also easier when core values are established. They provide the tool against which decisions can be measured. Solutions to financial, personnel, legislative, and even technology challenges can be more thoughtfully considered and evaluated against the organization's values.

Values play a key organizational role as a recruiting and retention tool. Job applicants can be drawn to companies that espouse a set of values that they believe to be important. But recognizing qualifications is the first criteria to meet potential candidates highlight their experience, education, and technical knowledge on resumes. While they may hint at some generally accepted characteristics such as highly motivated, self-starter, and professional, it is not until the applicant is interviewed, or hired, that their true values begin to emerge. For this reason, it is critical that the interview panel draws out as much of candidate's value system as possible and evaluates fit within the team and the overall organization. During this time, "employers should trade 90 percent talent for just 10 percent character" (www.forbes.com). Once hired, employees who embrace and display the core values will be better suited for leadership roles and promotional opportunities. Finding the person whose values are on par with the culture the first time can result in high performance, quality service delivery, and an engaged and

committed employee pool. Value alignment can also reduce conflicts with other members of the organization, turnover, and related training expenses.

## Conclusion

The creation of public sector values is not a new concept, and over time a common set of value types has been supported. What is relatively current is the *value* that has been placed on values. Mandating instruction as part of an accredited curriculum is a step that pledges that tomorrow's public sector leaders will appreciate the magnitude and benefit of establishing, and adhering to, a set of guiding values. Developing values is essentially branding an organization, and those values will manifest in the type of community that is created and the employee population that serves that community for many years.

# Public Versus Private Sector

Anurag Kumar Srivastava
Department of Public Administration, School of Liberal Studies, Pandit Deendayal Petroleum University, Gandhinagar, Gujarat, India

## Synonyms

Corporate Sector; Government administration in opposition to Private enterprise; Government agency contrary to business sector organisation; Public owned vis a vis for-profit business; Public-private sector analysis; Service motive and profit orientation; State led administration

## Definition

Private Sector: The private sector is the part of a country's economic system that is managed and operated by individuals and companies, rather than the by government. Profit making is the foremost objective of private sector organizations.

Public Sector: The public sector consists of all publicly controlled or publicly funded agencies, enterprises, institutions, and other entities that are engaged in delivering public services, goods, policies, programs, and schemes.

## Introduction

Public administration can be broadly distinguished from private administration on the basis of the nature of the institutional arrangements. Public administration is governmental administration concerned with achieving the objectives of the state as enshrined in constitutional values and public policies for development of all along with service motive. Private administration, on the other hand, is concerned with administration of private business organizations having policies to cater the interest of business entities/individuals along with profit motive.

It is essential to draw and define the boundaries of public sector in order to avoid ambiguity. Therefore,

it is necessary to identify specific criteria for defining the boundaries. The concept of public sector is broader than merely that of government and might overlap with the not-for-profit organizations or private sector entities. The public sector consists of an expanding sphere of organizations, with government lying at the center, followed by commissions, institutions, and public enterprises. In the region of this sphere there exists a zone consisting publicly funded, privately executed projects through Public Private Partnership (PPP) and government services contracted out to private players.

The last two decades have witnessed an upsurge of economic reforms intended to curtail the role of the public sector and expand the role of the market (Cook and Kirkpatrick 1988).

Privatization, therefore, has its roots deeply embedded in the ideological foundations of the neo-liberal ideology right that recognizes market as consistent and benevolent (Martin 1993), and considers the private sector superior to the public sector.

Two schools of thought signify the public versus private sector debate. The public sector school believes that society has some common concerns, problems, and developmental needs which can be addressed by the state. The state has political, legal, and moral mandate to identify common concerns along with the competency to tackle them.

The private sector school, on the other hand, believes in economic rationality of man who is capable of maximizing his interest without being dependent upon the public sector. This school believes in providing choices to the people. Plane (1997) observed that today's uncertain enthusiasm for the private sector is similar to the one policy makers once had for public sector-led development in the 1970s.

## Differences Between Public and Private Sector

### Political Direction

Public sector administration is political, while private administration is a political, public administration operates in political settings, however private sector remains free from political context and considerations.

### Broad Base and Democratic Decision Making

Public sector is characterized by broad base decision making in which various segments of the society are given an opportunity to reflect their concerns. The decision making is also democratic in the sense that it allows possibly all the stakeholders to be part of decision making.

### Devoid of Profit Motive

Public sector is largely devoid of profit motive, whereas the private administration gives imminence to profit motive. The major objective of government is to provide services to the people and promote welfare of all.

### Social Prestige

Public administrators enjoy high status and social prestige in comparison to their counterparts in private enterprises especially in developing countries.

### Public Scrutiny and Public Accountability

All the actions of public administration are exposed to wide public scrutiny and gaze because the public closely observes the conduct and working of the public institutions and bureaucracy. Public accountability is the hallmark of Public administration especially in regard to democratic system. The responsibility and accountability of public administration lies to the public, not directly but indirectly through political executive, legislature, and judiciary. On the other hand private administration does not operate under such kind of public glare and largely remain free from public accountability.

### Service and Cost

Most governments spend more money than their revenues. This results in having a deficit budget wherein expenditure exceeds revenue. However, private sector earnings often exceed expenditure.

### Legal Framework

Public sector operates within a constitutional and legal framework. It is bound by laws, policies, and rules. The responsibilities of public administrators are determined by a set of constitutional-legal

practices, code of conduct, and regulations. Government officials are mandated to act within their legal powers and purview of law.

### Consistency of Treatment

A public official is required by law to maintain a high level of dedication, uniformity, and accountability in his dealings with the public. Officials are required to observe the principle of equality of treatment in serving the people and not discriminate against any person; however, the private sector prioritize differential and preferential treatment of people in order to further its profits motives.

### Comprehensive

Public sector administration is comprehensive administration. It is believed that almost everything under the sun is directly or indirectly under the domain of public administration. It is by all means larger than any big private entity in regard to size, scale, complexity, and diversity.

### Monopolistic and Indispensable Services

In public administration, there are various sectors wherein monopoly of the government exists and private parties are not allowed to compete with it. For instance, defence, national security, foreign affairs, law and order, mint and currency, etc., as these are the exclusive fields of the government and thoroughly important for the community and polity of the country.

### Anonymity

In public administration, even the most senior officials carry out administration in an anonymous manner and political executive takes the credit or blame for the administrative actions; however, in private administration the anonymity is not recognized and credit or blame for their acts lies on the individuals.

### Lower Level of Efficiency

By and large public organizations rank poorly in terms of efficiency with their private counterparts. However, due to diverse responsibilities, involvement of a various hierarchical levels, complex maze of rules and regulations, job security and strict adherence to policies has resulted in lower level of efficiency in public organizations. Efficiency is not considered as the hallmark of most public sector organizations. With profit as the major motive and flexibility in operations the level of efficiency in private organizations is higher than public sector organizations.

## Similarities Between Public and Private Sector

The public and private sectors are gradually becoming interdependent. There has been an extensive collaboration between public and private sector. Public services in the domain of health, education, social welfare, etc., are contracted out to private sector. **Henry Fayol**, **Mary P. Follet**, and **L. Urwick** as quoted in (Sharma and Sardana 1988) do not consider that distinction exists between public and private administration. The classical writers believed the view that public and private administrations are the undifferentiated members of the genus administration. **Henri Foyal**, for instance, says that there is only one administrative science, which can be applied equally well to public and private sectors. The following similarities have been observed in public and private administration.

### Common Skill Sets

Both public and business administration depend upon common skill sets, techniques, and procedures.

### Profit Motive

In context of globalization and neo-liberal policies times the principle of profit motive is not limited to private sector only, because profit motive and revenue generation is considered as a virtue even for public sector.

### Common Personnel Practices

In personnel management, the public and private organizations have been mutually influenced by each other and best practices have been adopted in both the sectors.

### Adhering to Legal Framework and Policy

The private sector entities are also subjected to many legal restraints. Government exercises wider control over private sector through regulatory legislation such as trade, taxation, monetary and licensing policies, for checking monopoly, unfair competitive practices, market monopolization, etc. Consequently, private sector is not as free as it once used to be.

### Hierarchical Organizations

There is also a system of hierarchy and management in private sector organizations. Both have almost similar organizational structure, superior–subordinate relationships, and authority of command and direction.

### Close Contact with People

Public and private administration both have to maintain close contact with people and to remain informed about their services and also to get feedback about services and product. Therefore public relations have been recognized as an important tool to gauge the perception of the people for improving their service delivery. Public and private administration is constantly engaged in carrying out efforts to improve their working, management practices, for effective and efficient delivery of services to people or customers.

The foregoing discussion shows that differentiation between public and private administration is not absolute. In fact, they are becoming more and more identical and complementary to each other in various prospects. However, it does not suggest that there are no significant differences existing between these two types of administration.

## Public Versus Private Debate

Both public and private administrations have to operate and compete in the same area for catering the needs of the people. New public management puts emphasis on managerial techniques, efficiency, free market; profit-oriented government, etc. which are to be adopted by public sector administration for the efficient delivery of public services. This reflects the belief that public sector should espouse practices prevailing in private sector. Expansion of public–private partnership, disinvestment of public sector undertakings, and privatization of various core sectors of economy reveals that private sector has emerged as a dominant player in the domain of manufacturing, defense, security, communication, aviation, transportation, education, and health. It is also quite obvious that around 40–50% of the governmental work is being contracted out to the private sector which reflect the close integration and engagement of public and private sectors in delivering services to the people.

Private sector will work best when the private interest is aligned with public interest. For this to take place, the government must define and characterize the public interest in such a way that private sector can easily comprehend it and work for it. In order to promote this alignment between the private sector and the public interest is through promoting fair competition between public and private entities.

Vickers and Yarrow (1991) used economic theory to demonstrate that there are imperfections in both private and public ownership. Public interest suffers when public sector pursues activities that are not in the interests of the citizens or private sector performs actions which are inconsistent with the public interest. For instance, superior efficiency of private sector is emphasized as an argument for promoting privatization; however, too much emphasis on efficiency of private sector efficiency has its own implications specially in regard to developing economies and democratic countries. Democratic political sphere is different from market. Democratic polity provides for unequivocal articulation, information, debate, accountability, social justice, criticism, advocacy, and protest as its key elements. Privatization creates restraint on this public sphere. These are the vital elements of democracy whose significance cannot be reduced to efficiency.

## Conclusion

Under the aegis of neoliberal ideology and with the emergence of liberalization, privatization, and

globalization, advocacy for wide-ranging economic liberalization and policies that extend the rights and abilities of the private sector over the public sector is quite noticeable. Promotion of massive privatization and reduced governmental intervention in the economic life of nation is an accepted tenet of neoliberal philosophy.

However, amid repeated market failure, growing debate on deglobalization, it is high time to revisit and reconsider the unbridled faith in competency, efficiency, and effectiveness of private sector. The role of state in considering people as citizen is paramount; customer-centric approach of private sector towards people serves limited purpose and hence cannot be a substitute for state-led holistic approach towards welfare and development of the people.

There are pertinent questions such as how public sector should work in order to achieve greater efficiency? Should the government be run like business? Can the government be run like business? Can state absolve its responsibility of being the protector of public interest? Will private sector be able to fill the space vacated by public sector in core domains of socio-economic development? These questions require serious deliberation and substantiation through empirical evidences from global and national perspectives before arriving on the conclusive opinion for advocating the retreat of state in the sphere of socio-economic welfare. In fact, the global experience of privatization has brought mixed outcomes in developed and developing nations due to variations in the market, competitive advantages and disadvantages, regulatory framework, policy orientation, and socio-economic realities, henceforth, it is equally challenging to draw generalization for advocating or rejecting privatization.

State is under constitutional and moral obligation to perform its sovereign duty of protecting the rights and interest of citizens. Therefore, the state should be an active player in the pursuit of ensuring development of all. It is also significant to ensure that neoliberal ideologies and free market system do not compromise the civil liberties and interest of the people. Sound regulatory, legal, and oversight framework is essential for ensuring that private sector operates in fair and transparent manner. In this regard, the role of public sector becomes crucial in realizing the objectives of development by assimilating the virtues of private sector within public sphere without compromising the cherished goals of democratic polity.

The governmental administration is affected by virtually everything that exists in the life of a nation. It includes policies and activities of enormous complexities for transforming the life of people. Public sector conduct necessitates the wisdom, intelligence and interplay of legislators, bureaucracy, and political actors within socio-economic-cultural and legal milieu in advancing the public interests and achieving welfare for all.

# Public-Private Partnership and Bureaucracy

Meena Subedi
Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Administration; Alliance; Industry; Infrastructure

## Definition

The partnership involves cooperation – i.e., "to work or act together." A partnership can be defined as a collaboration between people or organizations in public or private sector for mutual benefit. Public-private partnership (PPP), according to Harding, (1990) is "any action which relies on the agreement of actors in the public and private sectors and which also contributes in some way to improving the urban economy and the quality of life" (p. 110). In the United States, PPP plays a vital role to restore local and urban communities (Osborne 2000)

## Introduction

Public-private partnerships between state and local governments are often advocated as a "best-of-both-worlds" substitute to public provision and privatization. The government decides for a public-private partnership with an assumption that collaboration offers a better way to finance infrastructure without adding burden to the public debt (Wang 2015). PPP works as a method of utilizing private financing and expertise for the effective implementation of investments in infrastructures such as airports, railways, highway construction, toll roads, and so on. Therefore, PPP can be understood as a method of collaboration involving public authority and a private legal corporation to provide goods or services to the public (Koppenjan 2005; Yang et al. 2013). With the use of a contract (granted by public authority to the private sector partner), the responsibility of PPP is to build infrastructure, design equipment, and finance the project for public service (Wang 2015).

PPP denotes a division of labor between government and the private sector across the policy domain. The use of PPP is evident in various policy fields, such as education, health care, energy policy, criminal justice, transportation, environmental policy, technology policy, and many more (Rosenau 2000). PPP has demonstrated its cost-effective services by "combining the strengths of the public sector and their financial stability, willingness to invest, and the innovative management techniques of the private sector" (Bult-Spiering and Dewulf 2008, p. 10).

## Public-Private Partnership on Toll Roads

The private sector was mostly responsible for the construction and management of the roads and highway in the eighteenth century (Edwards and Roth 2017). Klein (1994) reports that in the eighteenth and nineteenth centuries more than 2,000 companies built private toll roads in the United States. With the advancement of the nineteenth century, the private road companies were gradually put out of business by the railroads (Edwards and Roth 2017). However robust automobiles industries in the twentieth century put a strain on the railroad companies, which demanded the increment and advancement in the roads. Also, the economic growth in the twentieth century also created excess demand for roads. The governments (both state and federal level) in the twentieth century responded to these needs of the new roads by getting involved in the construction of modern highways financed by federal funds, tolls, and tax-exempt revenue bonds (Wang and Zhao 2014).

The use of PPPs in the last two decades has grown almost five-fold around the world (PWC 2010). The increasing admiration of PPPs is evident in many developed, developing, and emerging economies (Roehrich et al. 2014). PPP has been one of the most effective governance structures for public infrastructure projects (Geddes 2011). The concept of partnership gained a worldwide popularity in the 1980s although it is not a new concept. During the 1950s and 1960s, private sector started to get involved in the public service delivery while the government was beginning to increase the investment to promote regional privatization to reduce their responsibilities and tasks (Bult-Spiering and Dewulf 2008). The main idea behind partnership in toll road project is to bring together the strengths of both public and private sectors to provide services in cost-effective manner with the highest quality (Warner and Hebdon 2001; Zhao 2002). However, the decision to use

partnership for US highway development is believed to be significantly affected by the socio-economic factors, political conditions, and other external influences.

"In principle, PPPs involve clarity in specification and requirement, clear and enforceable contracts with proper cost efficiency incentives, and transparency in the bidding process. The intention is that government sets either the general objectives or specific outputs and leaves the private sector to design and manage the project, including the input mix" (Parker and Hartley 2002, p. 98).

## Theoretical Benefits/Problems Associated with PPP for Toll Roads

Three major public finance theories – principal-agent theory (P-A theory), transaction cost economics theory (TCE), and resource-based theory – can be used to discuss the public-private partnership for toll roads.

### Principal-Agent Theory (or Agency Theory)

Numerous public finance literatures rely on agency theory to explore the nature of public-private partnerships. Laffont and Tirole (1993) and De Palma et al. (2012) use the approach of incentives and principal-agent (P-A) to explain PPPs. In an agency relationship, one party, called the principal, delegates a portion of his/her power to another party, agent. Thus, the agent makes decisions and acts on behalf of the principal. This theory applies to the case of a public and private partnership for toll road construction and management in that public sector acts as the principal and private sector as the agent. As the theory suggests, for the partnership of toll roads, government mandates the private sector to perform a specific task on its behalf. If the public sector (i.e., the principal) succeeds in aligning its primary objective (i.e., to construct the roads most efficiently and effectively) to the private sector (i.e., the agent), the principal-agent relationships serve very well for PPPs.

However, the principal-agent problem arises when the principal cannot accurately monitor the productivity of the agent. "The result of opportunistic behavior may be adverse selection, the ex-ante choice of an inferior option, or moral hazard, increasing the ex- post risk that one party will exploit the terms of the contract to the disadvantage of the other party" (Parker and Hartley 2002, pp. 99–100).

*Adverse Selection*: An inefficient private firm succeeding to get government contract by lobbying is an example of adverse selection problem as the public sector (i.e., the principal) delegates the road construction responsibilities to the private sector (i.e., the agent) without having complete information about its technology. In economics and finance literature, the most commonly given example of adverse selection problem for insurance companies is that an insurance company provides insurance to agents who privately know how good a driver they are. In our former example the private sectors secretly know how good they are in road constructions; hence, in the lack of proper information, public sectors always face the risk of contracting inefficient private contractors.

*Moral Hazard*: Our daily life is replete with examples of moral hazard problems. A driver after purchasing full liability insurance becomes careless and performs reckless driving is an example of a moral hazard problem. A salesperson getting paid net salary, not on sales numbers, tends to shirk as she/he gets paid salary regardless of a number of sales. In these scenarios, both the driver and the salesperson are acting in bad faith by underperforming the job. In the case of public-private partnership of toll roads, there is always a risk of moral hazard issues on the part of the agent. The private contractor, for example, using low quality/quantity materials in road constructions without the knowledge of the public sector.

Prior literature such as De Palma et al. (2012), Dewatripont and Legros (2005), and Williamson (2002) recommend the following remedy to address the adverse selection and moral hazard problems in PPPs:

- A fully specified, enforceable contract between the government and the firm
- Stable terms of contract over time

- Measurable output indicators, and service delivery that can be monitored
- Credible punishment in case cheating is proven. For example, the public sector can perform ex-ante, and ex-post audits to detect any contract violations

## Transaction Cost Economics Theory (TCE)

Transaction economics, the dominant theory, has been used to describe PPP (Roumboutsos and Chiara 2009). Much of the prior literature (Ping Ho et al. 2015; Roumboutsos and Chiara 2009) view TPPs through the lens of transaction cost economics (TCE). TCE theory posits that "the three major opportunism problems embedded in infrastructure PPPs are possible to cause substantial transaction costs and render PPPs a costly governance structure" (Ping Ho et al. 2015, p. 1). The three main opportunism problems are the firm's holdup problem, government-led holdup problem, and opportunistic bidding problem due to unbalanced profit pool (Ping Ho et al. 2015). A high transactions cost may render PPPs an inferior choice.

### Private Contracting Firm Holdup and Transaction Costs

Ping Ho et al. (2015) argue that "when PPP projects are in distress, governments are often willing or compelled to renegotiate and provide various aids, such as helping the concession firms to acquire more loans or to be relieved of some financial obligations, granting direct or indirect subsidies, and extending the concession duration" (p. 5). Their study suggests that governments in PPPs are more prone to open the door for renegotiation. Thus, renegotiations will often be expected ex ante by the private contractors in PPPs. Since renegotiation is expected later, the private contracting bidders will bid aggressively just to win the project in anticipation of future negotiation. This practice results in increased transactions costs.

The private sector firm holdup problems are common in projects where investment from the government is high, the project is politically and economically important, the project scale is too large, the project complexity is high, the projected uncertainty of revenue/demands is too high, and the capital market is immature. Identification of these project characteristics before the agreement to collaborate with a private contracting party may help the government to avoid future transaction costs by enforcing stable contracts with clear objectives and output indicators, and punishment in case of violations or unnecessary future renegotiations.

### Government Led Holdup and Transaction Costs

The government can also act opportunistically and initiate renegotiation once the private concessionaire builds the roads and starts the operations. The government may ask to reduce the tolls paid to the private party or increase taxes paid to the governments (Guasch et al. 2007). The prior literature argues that many government-led renegotiations are opportunistic, with politicians trying to please their constituencies. From the TCE perspective, government's opportunism through government-led renegotiation also causes substantial transaction costs regarding ex-ante and ex-post inefficiencies (Erkan 2011).

The government-led holdup is ordinary in institutional environments where the legal climate is immature, government income is low, and the political and policy stability is low. Identifying these institutional characteristics ahead may help to prepare better-specified contract backed up by penalties for unnecessary future renegotiations and contract violations.

### Opportunistic Bidding Problem Due to Unbalanced Profit Pool and Transaction Costs

Government roads projects with short-term profits provide an incentive for private contractors to win the contract and earn the short-term construction returns. This incentive is profound if the equity investors (i.e., shareholders) of the private contracting firm can invest in the project at the expense of debt investors (i.e., bondholders). Since shareholders are the primary decision-makers, they are tempted to bid on the road project using money that they raised from debt financing. This may lead to opportunism problem due to unbalanced profit pool in PPPs. The inefficiency due to opportunistic bidding and investment is

profound (Ping Ho et al. 2015, p. 4). Opportunistic bidding drives out honest and efficient bidders and awards the projects to the opportunistic bidders, thereby rendering the projects to face early failures and need government bailouts.

This opportunism problem may lead to increased transactions costs between the public and private contracting parties. The literature provides evidence that the high transaction costs could make PPPs a flawed governance choice for transport infrastructure (Ping Ho et al. 2015). Thus, it is imperative to reduce transaction costs in PPPs. The above-mentioned opportunistic bidding problem is typical in a project where the profit is attractive for initial constructors, not to future operators. This problem can be addressed by asking a contractor to share both constructions and operation responsibilities. Similarly, the institutional characteristics for the above referenced opportunistic bidding problem are inexperienced government and immature capital markets (i.e., a small capital market with low financing capacity and lack of professionals in finance). Identification of these institutional characteristics before the agreement to collaborate with the private contracting party may help the government to avoid future transaction costs by enforcing stable contracts with clear objectives and output indicators and punishment in case of violations or unnecessary future renegotiations.

### Resource-Based View (RBV) Theory

Ho and Tsui (2009) and Roumboutsos and Chiara (2009) argue that although TCE is the dominant theory and has also been used to describe PPPs, resource-based theory helps better explain the rationale for and success of alliances. As argued by Das and Teng (2000) the value-creation potential of resources can be obtained when the funds are appropriately pooled together. According to the resource-based theory, there could be two potential motives for the local governments to have used public-private partnerships to design, build, finance, and operate public toll roads:

1. The local government aims at accessing additional funds and managerial expertise in the private sectors, thereby gaining access to the valuable and/or additional resources possessed by the private sectors.
2. The private sector in the PPP may wish to retain its personnel. Thus, local government partnership with the private sector helps the private industry work together with the public sector without losing its valuable human capital.

Thus, the resource-based view of the PPP to design, build, finance, and operate public toll roads as a valuable strategic alliance where the alliance is based on the expectation that pooled resources will produce an outcome more effectively and efficiently than each party could provide independently. From the resource-based view, the value creation advantage stems from each party sharing their capabilities and financial risk and compensating for each other weakness, thereby creating synergy.

According to Robmustus and Charia's (2009) resource-based view of a public-private alliance, the alliance will tend to perform when:

1. Goals are aligned with clear advantages for all parties
2. The alliance partnership contractual agreement builds on the assets of potential partners
3. Capacity is enhanced by compensating for each party's weaknesses

The proper incentive mechanisms must be in place to assess (1) above. To assess (2) and (3) above, the SWOT (Strengths, Weaknesses, Opportunities, and Threats) analysis is performed for the principal parties (e.g., the government and the private sector) involved in the designing, building, financing, and operating of the public toll roads. Similarly, the PEST (Political, Economic, Social, and Technological) analysis is performed at a county, state, or federal level to assess the overall longevity of the endeavor.

## Conclusion

In the past, the use of PPP was relatively rare. At present, some "governments are keen to shift

more welfare provision into private hands to keep public spending under control and to avoid having to raise taxes or cut benefits" (Rosenau 2000, p. 2). And this venture between public and private business currently celebrates remarkable approval in both official and scholarly circles.

The alliance between public and private sector requires actors from each sector to embrace each other's characteristics and points of view. Public sector actors would need to think and behave like entrepreneurs, and private sector actors would need to carefully consider the public interest and expect greater public accountability (Linder 1999).

## Introduction

Public-Private Partnerships, also known as PPP, are contracts amid government agencies and private organizations that involve the government agency paying, reimbursing, or transferring a public asset to the private sector in return for goods or services over a set period. Public-Private Partnership in the delivery of public services is considered a balanced approach as it tries to mingle the best of both worlds: the private sector with its resources, management skills, and technology and the public sector with its regulatory actions and protection of the public interest (UN 2007). Their key characteristics include long-term service provisions, transfer of risk to the private sector, and various forms of long-lasting contracts between legal entities and public authorities (Nwangwu 2013). In recent days, PPP have gained wide interest around the globe.

## Defining Public-Private Partnerships

Partnership is a contractual arrangement between two sectors where the public sector assigns certain missions to a private operator with some specified objectives to attain. The public sector partner retains regulatory control and owner-ship of the infrastructure while private sector playing the role of implementing agency (www.suez.com/metiers/english/environnement/lexique.php, retrieved on 12 Oct 2007). Government of India (GOI) and Asian Development Bank define PPP as arrangement between a government or statutory body or government owned entity on one side and a private sector unit on the other, for the provision of public assets and/or related services for the advantage of public, through investments being made by and/or management undertaken by the private sector entity for a specific time period, where there is a substantial risk sharing with the private sector and the private sector receives performance linked payments that conform or are benchmarked to specified, pre-determined, and measurable performance standards (Nwangwu 2013).

Despite the fact, that there is no single definition of PPP, the primary aim of this cooperation broadly refers to long-term, contractual partnerships between the public and the private sector agencies explicitly targeted toward financing, designing, implementing, and operating infrastructure facilities and services that were customarily provided by the public sector. Asian Development Bank (ADB) asserts that effective PPP requires certain advantages on both the public and private sides in performing specific tasks. The government's contribution to a PPP may take the form of capital for investment available through tax revenue, a transfer of assets, or other commitments or in-kind contributions that support the partnership. The government also provides social responsibility, local knowledge, environmental awareness, and the capacity to mobilize political support. The private sector's responsibility in the partnership is to make use of its knowledge and proficiency in commerce, management, operations, and innovation in order to run the business more competently and efficiently. In addition, the private partner may contribute investment capital based on the form of contract (Nwangwu 2013).

## Emergence of Public-Private Partnerships (PPP)

The story of private provision in the public spheres points to the fact that there has always been some amount of public and private sector collaboration in various aspects. The tales of private contracting in the public sphere are many: Mathew, the private tax collector from the Bible, the private cleaning of public street lamps in

eighteenth century England, private railways of the nineteenth century, or conquering of the Spanish Armada in 1588 where 82% of the 197 vessels in Drake's fleet were private contractors to the Admiralty, all were examples of contracting. The first ship sailed to America was a joint effort between public and private actors, an example of cooperation (Greve and Hodge 2005). The turnpike era in England beginning in the 1650s and in the United States beginning in the 1790s, both lasting until the second half of the nineteenth century, illustrate many forms of PPP. In England, roads were organized as trusts, quasi-public corporations, chartered by parliament, but with the aim of earning a profit. There was significant oversight; the right to operate turnpikes was not in perpetuity but had to be renewed by parliament. When turnpike organizations went bankrupt (often due to the rise of railroads), they were taken over by local government. Toll farming, the selling of the right to collect tolls, was another aspect of private involvement, reducing public sector risk (in principle) by exchanging a lump sum payment for the right to collect tolls which were subject to the vagaries of demand and required entrepreneurship and incentive for enforcement (Levinson et al. 2006). From history, it is seen that mixing of public and private spheres has taken place over many centuries in various forms like cooperation, cooptation, contracting, etc. So PPP cannot be said a recent reform agenda, rather discovering new modes of partnerships to find out what useful refinements and adaptations are must for a people oriented competent government has come into sight in current days (Wettenhall 2005).

By the early 1980s, a number of diverse factors caused changes in the widespread perceptions of governance and of the proper function of the state. Rising intercontinental trade and investment; increasing economic, social, and political interface across national borders; rapidly emerging technological innovations; and the spread of knowledge and information globally made the change faster one. The notion of governance extended its scope to embrace not only the government but also other societal institutions, including private sector and civil associations. Discussions and debates shifted from the proper distribution of responsibilities inside government to how robustly the state should mediate in economic activities. To make public service delivery more proficient governments started decentralizing their functions. Globalization forced some governments to restructure their composition. A change in the development theories and strategies in international aid agencies and participatory development also led to increasing decentralization. By the mid-1980s, with the continued weakening of centrally planned economies, the waning of the Cold War, economic, and political forces restructured the conventional impression of governance and decentralization. The fall of authoritarian regimes in Latin America during the 1980s and in Central and Eastern Europe during the early 1990s; the rapid spread of market economies; more democratic principles in East Asia; trends of privatizing state enterprises; downsizing large central government bureaucracies; and pressures from the International Monetary Fund, the World Bank, and other international development organizations all led to new interest in decentralization and a new concept of governance. Pressures by various political, ethnic, religious, and cultural groups seeking greater autonomy in decision-making and stronger control over national resources, also pushed governments to decentralize its functions that ultimately has encouraged forming partnerships among different sectors. Moreover, it was found that in some sectors performance of private sectors are much more efficient than government (Cheema and Rondenelli 2007).

In addition, new public management and entrepreneurial government in industrialized countries shaped the way international development organizations and many reforms-oriented public officials in developing countries began to think about what governments should do and how they should perform (Cheema and Rondenelli 2007). Moreover, it was perceived that in the period of globalization and global economy, partnerships can be useful to expand resources effectively, and improve infrastructure and citizen services, while reducing financial and other burdens on government. Partnerships can leverage resources and

funds. So gradually partnership in various forms has started its journey all over the world both in the developed and in the developing (Paoletto 2000). Specially in 1992 by the staging of the Rio Earth Summit, where major transnational corporations and political leaders emphasized on "cooperation" and "dialogue" rather than "confrontation" with each other, interactions among governments, private enterprise, and civil society organizations have increased and all three of these entities have come to be seen as institutions of governance, whose participation is crucial to delivering services to the people (Rizvi and Bertucci 2007).

## Typology and Theory of Public-Private Partnerships

The applications of PPP vary from country to country. There are various types of PPP, established for diverse reasons, across a wide variety of market segments, reflecting the different needs of governments. However, the following terms are commonly used to describe typical partnership agreements:

- Buy-Build-Operate (BBO): Transfer of a public asset to a private or quasi-public body usually under contract that the assets are to be upgraded and operated for a specific period of time. Public control is exercised through the contract at the time of transfer.
- Build-Own-Operate (BOO): The private sector finances, builds, owns, and operates a facility or service in perpetuity. The public constraints are stated in the original agreement and through on-going regulatory authority.
- Build-Own-Operate-Transfer (BOOT): A private entity receives a franchise to finance, design, build, and operate a facility (and to charge user fees) for a specified period, after which ownership is transferred back to the public sector.
- Build-Operate-Transfer (BOT): The private sector designs, finances, and constructs a new facility under a long-term concession contract and operates the facility during the term of the concession after which ownership is transferred back to the public sector if not already transferred upon completion of the facility. In fact, such a form covers BOOT and BLOT with the sole difference being the ownership of the facility.
- Build-Lease-Operate-Transfer (BLOT): A private entity receives a franchise to finance, design, build, and operate a leased facility (and to charge user fees) for the lease period against payment of a rent.
- Design-Build-Finance-Operate (DBFO): The private sector designs, finances, and constructs a new facility under a long-term lease and operates the facility during the term of the lease. The private partner transfers the new facility to the public sector at the end of the lease term.
- Finance Only: A private entity, usually a financial services company, funds a project directly or uses various mechanisms such as a long-term lease or bond issue.
- Operation and Maintenance Contract (O&M): A private operator, under contract, operates a publicly owned asset for a specified term. Ownership of the asset remains with the public entity. However, many do not consider O&M's to be within the spectrum of PPPs and consider such contracts as service contracts.
- Design-Build (DB): The private sector designs and builds infrastructure to meet public sector performance specifications, often for a fixed price, turnkey basis, so the risk of cost overruns is transferred to the private sector. Many do not consider DB's to be within the spectrum of PPPs and consider such contracts as public works contracts.
- Operation License: A private operator receives a license or rights to operate a public service, usually for a specified term. This is often used in IT projects (UNECE 2008).

The options available for delivery of public services range from direct provision by a ministry or government department to outright privatization, where the government transfers all responsibilities, risks, and rewards for service delivery to the private sector. Within this spectrum, public-

private partnerships can be categorized based on the extent of public and private sector involvement and the degree of risk allocation. However, the private sector is motivated by profits and so may give insufficient weight to quality or safety for the general public. Before the partnership is initialized, two things must be examined: whether the partnership add efficiency in use of limited resources and will the public be better served by the partnership (NCPPP 2002)? Both partners have risk associated with the partnership: the private businesses have to risk their own time and money and need to disclose financial conditions to the public; the public sector risks overcharging by the private partners, being forced into a poor negotiating position, and the potential for declining benefits over time (Levinson et al. 2006).

Chris Heymans (2002) identifies a number of fundamental principles underlie the feasibility and sustainability of partnerships. It is particularly important that they are transparent, that the participants are appropriately accountable, that key stakeholder considers them legitimate, and that the procurement is fair and competitive. At the same time, private sector participation in service delivery must be adaptable and flexible. According to him the fundamental principles of partnership are:

- Transparency: Clear rules, fairness, and transparency can ensure an attractive environment for private investors and other potential partners to work with local government in service delivery. Transparency is about the inclusive process that ensures that all stakeholders have proper information about potential impacts, policies, partnership objectives, and procurement criteria and processes. This is concerned with awareness building.
- Accountability: Private sector participation raises accountability questions because partnerships place certain responsibilities, normally carried by the public sector, in the ambit of private operators. Accountability is closely linked to creating incentives for the different parties. Elected councils have the incentive of meeting voter demands. Municipal officials may be encouraged through performance measurement that is linked directly to successful delivery through the partnership. The private partner has the incentives of maintaining a sustainable business and winning future contracts. Such incentives should be carefully considered during the negotiation of a partnership contract. Often, accountability is reinforced through penalty clauses applied if contractors fail to meet the expectations set out in the contract. Mechanisms that allow rapid response to customer needs also facilitate accountability. Customer complaint handling systems is one important element, and the introduction of the necessary support systems should enable service providers to function with sufficient accountability. Such systems enable end-users to make known what they require from the service industry and help service providers to respond to those requirements. Throughout, it remains important for a local council to make the best use of its links to the community that elected it, as a primary channel to gather information and to continuously convey customer views on the quality of services.
- Legitimacy and legality: To be credible, partnerships with the international and large-scale private sector need support from key stakeholders and a firm legal basis. This creates a safe environment for investors and a sound basis upon which the delivery of services can take place. If the legal basis of a partnership is in question, the accountability of the parties will be tenuous, compromising certainty that the contract obligation will be met. The key to addressing these challenges lies in effective process management and the due legal process. Stakeholder participation is essential, as it enables different parties to air their views, raise their concerns, and feel that they are part of the process. Special arrangements may be necessary to ensure that poor communities are well informed, and are able to influence decisions about various aspects of the partnership, such as service levels or tariff levels. The government should be clear about what it wants to achieve through private sector participation as this would enable it to engage with

stakeholders, either to convince them or at least to ensure a working arrangement that would avoid any stakeholders fundamentally opposing the partnership in ways that make it unworkable. Policy frameworks should be clearly articulated, information made accessible to all, and procedures for procurement should be open, fair, and credible. The legal basis of the contract must be beyond doubt. The statutory framework must provide the rights and obligations of the participating partners, and any regulators must be clear, and the legal basis must provide certainty for the partnership.

- Participation: Stakeholder participation is vital in enhancing ownership and sustainability. This would enhance the overall legitimacy of the project and also help to ensure that the service providers act accountably and with sensitivity to the needs of consumers. Participatory decision-making ensures a better fit between public investment decisions and community realities and preferences.
- Organizational culture: In the absence of legal and institutional structures for implementing decentralization, enforcing public accountability, and promoting participatory approach and partnership in development, the extent these features are reflected in social services depends on to a large degree on attitudes, values, and preferences of individual functionaries occupying influential positions. The functionaries at the top in governance hierarchy appear to be comfortable with the ascendant position for them. There is a lack of great enthusiasm and energy on the part of the political and government leaders for building a national partnership in health to achieve national objectives (Sobhan 1998).
- Trust: Trust is considered as one of the most crucial elements in forming a partnership. Fountain and Atkinson (1998) expressed that trust lowers the costs of coordination and cooperation and thereby increases collective productivity. Low trust led either to complete failure or to poorly performing non-collaborative networks. According to them, trust develops over time as individuals gain confidence in the reliability of others through a series of interactions.

Brewer and Hayllar (2005) opined that strong partnerships are built and sustained by norms of reliability consistent with the high levels of systemic trust. High levels of trust facilitate interactions within societies and organizations. When the government provides a strong legal system and tackles problems of injustice and inequality, social trust increases. Yet despite the improvements promised by recent public sector reforms, current levels of citizen distrust in government, both in developing and developed countries, pose a serious threat to the capacities of governments to govern effectively. PPP in the delivery of public services have become a popular phenomenon which is spreading all over the world and generating greater interest. In the words of Mc Quaid (2000), the underlying basis of the partnership may be a high level of trust, as in the view of partnership as a marriage which develops over time but is underpinned by trust and a mutual belief in the positive gains for both partners. So it is evident that forming effective partnership depends on mutual trust between partners.

Measuring the successful implementation of a PPP can be a controversial issue. PPP evaluation process has to take into account parameters including:

- The support for the PPP project by the public, government, politicians, and private firms.
- The satisfaction of stated objectives (costs, demand, timetable).
- The extension of the project or undertaking of new projects with similar parties.
- The project improves the efficiency of the system, the equity of the system, the environment, and the experience of neighbors to, and users of, the project.

## The Case: The Urban Primary Health Care Project (UPHCP)

This section examines in detail a project of PPP in the health sector in Bangladesh to establish the

criteria that lead to success or failure of PPP. The Urban Primary Health Care Project was designed and prepared by the Ministry of Local Government, Rural Development and Cooperatives (MOLGRD&CO); the Local Government Division (LGD) of the MOLGRD&CO was the formal executing agency of the project. The primary objective of the project was to improve the health of the urban poor and reduce preventable mortality and morbidity, especially among women and children and ensuring good quality preventive, promotive, and curative services. Another important objective of the project was to strengthen the managerial, financial, planning, evaluation, and coordination capacities of local government and thus make the Primary Health Care sustainable (ADB 1997).

The UPHCP went into operation, officially, on 30th March 1998. The first phase of the project ended on 30th June 2003 and then got extension in two slots, first up to 31st December 2004 and then again extended up to 30th June 2005. Since 1st July 2005 the project was renamed as UPHCP-II and started another 5-year journey (ADB 2005). The project covered more than 10 million urban population of Bangladesh and had a Primary Health Care (PHC) network of 25 Comprehensive Reproductive Health Care centers, 112 PHC centers, and 224 satellite clinics at community level. The project financed 24 partnership agreements, each covering 200,000–300,000 people. Each partnership agreement area consisted of one CRHC center, at least one PHC center per 30,000–50,000 people, and at least one satellite or mini-clinic per 10,000 people.

PHC centers provided a full range of essential services, including basic emergency obstetric care. The CRHC centers provided comprehensive emergency obstetric care, newborn care, and specialized essential services package. The partnership area was mapped and divided into areas containing approximately 5000 people or about 1000 households (ADB 2005). Mitra and Associates, Bangladesh, in collaboration with John Hopkins University, the USA, in 2005 found that there had been an increasing trend since the baseline period in most of the services. A high level of satisfaction among beneficiaries had been observed by their evaluation study. The report further opined that clients were satisfied with the quality of services and the goal of targeting the very poor was achieved by most Partner Organizations (POs) under UPHCP. They commented that UPHCP was efficient in reaching the poor and urban population in general, though there were some logistic problems with the POs (Mitra and Associates 2005). It was further explored that at the service providing levels, especially among the POs, there was dissatisfaction regarding overall management of PPP. POs were suffering from timely allocation and supply of medical equipment and some essential drugs which had a negative impact on service delivery. Additionally, the POs had no autonomy to procure medical logistics and family planning items directly from the market. The level of trust among and between different actors in the project was at low ebb. They did not trust each other and there was a lack of mutual respect mainly on the part of public sector towards Partner Organizations. Lack of mutual respect and misunderstanding was prevailing on both sides. Overall, the partnership under UPHCP was successful in satisfying beneficiary. However, there were a number of severe issues that hampered the overall governance of the project. Lack of adequate human, financial, and material resources; the absence of beneficiary participation; low level of accountability; and rigid and nonflexible organizational culture in the public sector all hindered management performance of the project thus challenging the success of partnership. The mechanism of accountability in the project was designed in such way that there was no room for the beneficiary by which they could hold the policy makers and service providers accountable. Only upward accountability mechanism was practiced in the project management. Furthermore, the public sector organizational culture was dominated by traditional centralized practices inherited from the British and Pakistani rules that created obstacles. Lack of trust and mutual respect between POs and public side, fear towards public sector by POs, superiority complexity and the tendency of underestimating, and lack of

coordination in program management all hampered the governance of the project (Ara 2011).

## Conclusion

Partnerships have come with both merits and demerits. It has been asserted that Public-Private Partnerships work best if the roles and responsibilities of each partner are defined. The government is responsible for defining the details of the objectives and that the standards are met and enforced to ensure the public's benefit and safety. The private sectors operating proficiently to be profitable take risks in new approaches and designs that the government is not always able to achieve. Partnerships to a great extent depend on how well the private sector manages the risk transferred to it and on the public sector's capability to manage the contracts for a long time. Care should be taken so that the best of both sides are efficiently utilized. Evaluations of the partnerships need to be carried on a continuous basis and any discrepancy must be reported immediately to avoid any unexpected situation.

# Public-Private Partnership Coordination: Lessons from Tanzanian Water Sector

Ethelbert Chinedu Nwokorie
School of Management, Public Management, University of Vaasa, Vaasa, Finland

## Synonyms

Coordination agency; Public-private partnership units; Success factors; Tanzania; Water sector

## Definition

Through public-private partnerships (PPPs), government agencies collaborate with private sectors to provide quality infrastructures and services to the people. Coordination agencies provide project support and guidelines and promote PPPs by coordinating and building trust among partners.

## Introduction

Public-private partnerships (PPPs) are avenues for private sector participation in provision of public infrastructures, goods, and services. It is a form of management where government agency/agencies collaborate with the private sector to provide quality infrastructures and services to the people (Nwokorie 2016: 1; Mahalingam et al. 2011: 341–372). PPPs utilize the strengths of both public and private sectors to bring affordable quality infrastructure and social services to the people. This chapter contributes to the literature on the role of coordination agencies (CAs) in the success of PPPs. CAs provide project support and guidelines and promote PPPs by coordinating and building trust among partners. This entry agrees with the conclusions of Van Den Hurk et al.'s (2016: 17) and Mahalingam et al.'s (2011: 341) studies that emphasize the need to involve CAs in PPPs in order to bring expertise in project development and structuring; bid process management, coordination, project risks, and mitigation; and attract political support to PPP programs. Lessons from the failed Dar es Salaam Water and Sewerage Authority (DAWASA) of Tanzania and City Water Services (CWS) PPP highlights the role of experienced CAs in PPP success.

This chapter argues that the DAWASA/CWS PPP failed due to the absence of an experienced CA. The failure illustrates the effects of poor coordination of the PPP process. The project marked the first time the government of Tanzania (GoT) was using PPP in water sector. CWS was to rehabilitate and expand water supply facilities and sewerage system services in Dar es Salaam and its surrounding towns (Triche 2012: 2; Qizilbash 2011; WaterWorld 2013). The project was to build a road map for further utilities and infrastructural development in Tanzania through PPPs. However, the Tanzanian Ministry of Water and Livestock Development (MWLD) canceled the PPP because of disagreements between DAWASA and CWS shortly after commencement. GoT created DAWASA in 1997 to provide piped water and sewerage services to Dar es Salaam and its surrounding towns. The infrastructure in Tanzanian water sector lacked maintenance for years, and DAWASA inherited infrastructure that was in a state of disrepair. As a result, DAWASA lost most of the produced water and could not provide the required services in this sector. In 2002, GoT adopted a National Water Policy (NWP) that introduced PPP in water sector to deliver affordable and sustainable water and sewerage services to the people. The NWP authorized DAWASA to appoint a private operator and endorsed the establishment of an independent CA to coordinate activities of the parties during the PPP process. This led to the creation of Energy and Water Utilities Regulatory Authority (EWURA) in 2002 (WaterWorld 2013).

The PPP process started in 1997, when Biwater International submitted a proposal to GoT for a joint venture with DAWASA. GoT invited three other companies (Saur International, Vivendi Environment, and Northumbrian Water Group PLC). Three of the firms opted for lease contract, but when GoT accepted and requested for bids, only Saur and Vivendi submitted bids. In May

2000, the bids were canceled, and a prequalification process was organized for the bidding companies. Saur and Vivendi met the prequalification criteria, while Biwater Gauff Tanzania (BGT) failed; yet it was prequalified. Nevertheless, Saur and Vivendi requested some amendments to reduce high operator's risks, but DAWASA rejected their requests; they withdrew from the process, and BGT emerged sole bidder and winner. The World Bank and the transaction advisor expressed doubts on financial soundness of BGT's proposal and its ability to meet performance expectations, but DAWASA ignored their concerns (WaterWorld 2013). Later, BGT merged with a Tanzanian firm Superdoll Trailer Manufacturing (STM) and formed City Water Service (CWS). In 2003, CWS and DAWASA signed the lease contract, and CWS began operation later in the year (WaterWorld 2013).

## Review of Related Literature

Proper coordination reduces possibilities for conflicts that might affect PPP success, strengthens interdependence of partners, builds trust, and helps PPPs succeed. Coordination aims to make every part of an organization function without difficulties and achieve its purpose with less friction and maximum collaboration. It produces harmony and equilibrium and aligns organizational functions, structures, and resources together for the achievement of common organizational goals (Nwokorie 2016: 2). Coordination refers to managing interactions between and among organizations involved in partnership. It strengthens interdependence and fosters harmonious coexistence among different entities working toward common goals. This study defines coordination in PPP as the process through which differences among partners are harmonized in order to achieve the goals of PPPs. The purpose and aim of coordination make it an important instrument for successful management of PPPs from the beginning to its completion.

To ensure proper coordination and success of PPPs, many governments establish and staff CAs with specialists to supplement government capacity in awarding and monitoring PPP contracts. They coordinate the processes and activities of PPPs at every stage (Mahalingam et al. 2011; Nwokorie 2016). CAs perform other functions such as quality control, policy formulation and coordination, technical advice, standardization, and promotion of PPPs. The World Bank (2007: 20–21) define CA as any organization created to promote and improve PPPs, with mandate to manage quality of PPP projects, attract more PPPs, and ensure that PPP projects meet the defined criteria like quality, affordability, value for money, and risk transfer. CAs are important in designing PPP frameworks and implementing them. It is important for CAs to have expertise in project management; contract financial, technical, and legal management; monitoring quality of service; contract compliance; project evaluation; performance monitoring; and partnership management (Nwokorie 2016: 2). CAs fill the gap in lack of capability by government agencies in implementation of PPPs because requirements of PPP projects are large (Mahalingam et al. 2011: 345).

As specialized government organs, CAs oversee activities of parties in PPPs to ensure that they follow the terms and conditions of the contract and achieve success. Good knowledge of PPP project preparation, procurement, and management prepare CAs to engage private sectors where and when necessary. It also helps to protect private sector interests and shield them from direct or indirect expropriation (Nwokorie 2016: 2). They provide information linkage and balance the interests of the parties, stakeholders, and the public where necessary in the partnership (Mahalingam et al. 2011: 360). They collaborate with the awarding government agency and private sector to resolve any disagreement that could lead to PPP failure (World Bank 2007). Sanghi et al. (2007: 2) explained that governments establish CAs to manage PPPs effectively and avoid failures. They promote and improve PPPs where governments' procurement policy, strategy, and incentives are weak and address the challenges that are capable of truncating project realization.

Coordination in PPPs begins from assessing the best achievable type of PPP for a project,

assessing the chances of meeting the objectives of the parties, to clearly defining the project implementation structure. This helps partners to recognize the needs and interests of each other and prepares the ground for effective coordination from the beginning (Nwokorie 2016: 3). By making PPP design competitive to attract more bidders, experienced CAs bring transparency in the process and make negotiation easy and less time consuming. Despite the huge market in Tanzania, lack of interest in Tanzanian water PPP by companies across the world was an indication of a poorly designed contract, which made the bidding unattractive and uncompetitive. Low bidder turnout in PPPs is the result of poorly designed contracts that are unable to attract bidders. Since only three companies participated in the bidding and two withdrew midway, the present case is arguably an example of unattractive and uncompetitive contract design (Nwokorie 2016: 3).

Managing PPPs successfully requires the capacity to identify, develop, and weigh preferable financing options, optimal risk transfer, contract negotiation, and management. For PPPs to give real benefits to stakeholders, involvement of CAs with expertise in PPP coordination, administration, project structuring, and bid process management and understanding of PPP risks from the beginning to the end of PPPs are essential or increase the capacity of government agencies in this respect to effectively monitor PPPs (Mahalingam et al. 2011: 341). Specialized CAs act on behalf of government agencies to secure optimal deals with private sector organizations, carry out feasibility studies, prepare detailed project reports, manage the bidding process, and monitor performance and progress of PPP projects (Nwokorie 2016). They promote PPPs in response to failures by government agencies and ensure that projects fulfill quality criteria (World Bank 2007). Due to the roles CAs play in PPPs, many governments use CAs to deliver PPP projects.

In a comparative study of success and failure factors of three PPPs in the United Arab Emirates (UAE), Dulaimi et al. (2010: 397–401) discovered that two of the PPPs failed due to inappropriate risk allocation and lack of political support due to the absence of specialized CA to equitably allocate risks and attract political support to the partnership. They were of the view that for PPPs to succeed, there is need for a well-organized and committed agency to coordinate it. Similarly, PPP clients should improve their knowledge of PPP projects. In a comparative study of the performance of three CAs in water sector PPP in India, Mahalingam et al. (2011: 341) argued that involvement of agencies that lack PPP and specialized knowledge affects the success of PPPs. In a study of PPP challenges in Malaysia, where Unit Kerjasama Awam Swasta (UKAS) was a CA, Ismail and Harris (2014: 8) found that UKAS's inexperience and lack of knowledge of PPPs manifested in poor coordination led to the failure of the PPP. The Batu Pahat Municipal Council (BPMC) PPP in Malaysia failed because of UKAS's poor supervisory frameworks and insufficient guidelines for the PPP. UKAS, which is a government department, lacked the experience and knowledge to coordinate PPPs.

Furthermore, the failed London underground PPP displayed the effect of poor coordination. Transport for London and London Underground Limited could not successfully coordinate the PPP with Metronet due to lack of technical knowledge. That led to the failure of the PPP (Nwokorie 2016: 3). The 2002 Farum local government PPP with FIH institute in Denmark could not achieve the construction of the indoor sports arena and soccer stadium due to similar reasons (Nwokorie 2016: 3). In a case study by Abd Karim (2011: 10), the Batu Pahat Bus Station PPP between BPMC in Malaysia and a confidential private developer failed due to long delay in negotiation and poor negotiation and management skill by the BPMC personnel who were inexperienced in handling PPP projects. In India, it was difficult for urban local bodies to conceptualize, procure, and manage PPP projects due to weak competences. The central and state governments addressed the weak competencies of PPPs by urban local bodies in India by creating specialized CAs. The specialized CAs help the urban local bodies to identify PPP opportunities, conduct initial feasibility studies to develop PPP projects, obtain approvals, and

coordinate the stakeholders involved the project (Devkar et al. 2013: 126).

In a comparative study of success and failure factors of water PPPs in Mozambique and Tanzania, Qizilbash (2011: 49) observed that the Government of Mozambique that introduced PPP in its water sector in 1998 recorded incremental success, unlike the DAWASA/CWS PPP. After 5 years of the PPP in Mozambique, investment started nearing breakeven and financial performance in four provincial capitals steadily improved. Water became available 24 h a day in three districts, 22 h a day in one district, and 14 h a day in another district. One important factor for the success of the PPP was that the government created Water Supply Regulatory Council (WSRC), a CA, and empowered it from the beginning to balance conflicting objectives among partners, ensure that financial goals of government were met, and secure fair pricing for customers (Qizilbash 2011: 45). However, in the case of Tanzania, though GoT created EWURA as a CA, it failed to empower it to start functioning immediately until the PPP failed. The Tanzanian case failed mainly due to EWURA's inability to function, while Mozambique succeeded because WSRC functioned from the beginning. All these explain how the absence of specialized CAs, unofficial expert body, or experienced government agency affects coordination and success of PPPs.

In India in 1996, Alandur Municipality lacked the capacity to coordinate the building of a state-of-the-art sewerage system PPP; it approached INFRACREATE, an agency that coordinates PPPs in water sector in the State of Tamil Nadu, for assistance. INFRACREATE designed and structured the project; prepared project memoranda; negotiated lending rates; developed the financial structure and conflict resolution mechanisms; prepared the bid documents, evaluation procedures, and a concession agreement that featured equitable risk sharing; and solicited for bids. Several companies submitted bids. The project was awarded through a transparent bidding process. Nevertheless, INFRECREATE's involvement was terminated at this stage. Having laid the foundation for a good start, the project took off on a good note. As the implementation progressed, INFRECREATE's exit began to affect the project. It started with delay in approvals and inspections to changes in project plan. This was followed by the absence of communication, which led to a conflict that subjected the PPP to litigation. This highlights the role an experienced CA plays in PPP structuring, coordination, and implementation from the beginning to the end (Nwokorie 2016: 4; Mahalingam et al. 2011: 341–372).

The PPPs in the Spanish transport sectors succeeded without CAs because at the Spanish national level, there are well-experienced sector and focused bodies such as Sociedad Estatal de Infraestructuras Del Transporte Terrestre (SEITT) that are deeply involved in the delivery of PPP projects in the transport sector. Although SEITT was not a designated CA, it performed the roles CAs perform in PPPs. SEITT functions include development of the business case for PPPs, analysis of tariff structures, definition of policies for the development of PPPs, preparation of the terms and conditions for procurement, viability assessment, and financial structuring of PPPs. To illustrate the importance of effective coordination to successful implementation of PPPs, governments of some countries have empowered unofficial expert bodies to assist CAs in PPP coordination and implementation in their countries. In Italy, the government empowered unofficial PPP expert body to assist the Italian Unita Tecnicà Finanza di Progetto (UTFP) to coordinate PPPs. In Slovenia, the Slovenian Division for Public Property Management benefited from the experience of unofficial PPP expert body in successful coordination and implementation of PPPs. Similarly in Portugal, the Portuguese management holding company has enjoyed the same benefits, as well as Cyprus, where unofficial expert bodies have been involved in PPP coordination with official CAs (Van Den Hurk et al. 2016: 13).

The positive roles of CAs notwithstanding, in some countries with weak government effectiveness like the Philippines, government institutions perform poorly. CAs cannot be an island of excellence in such poor performing government. In the 1990s, CA was directly involved in power sector

PPP in the Philippines. However, weak government and institutions constrained the CA's capacity to perform necessary coordination functions in the PPP, and the PPP was not a complete success (Sanghi et al. 2007: 2–3, 5). In some countries, organizational structure of CAs limits their authority and capacity to significantly influence and implement PPPs. In such countries, CAs' involvement in PPPs has been minimal, while the government uses other bodies to coordinate and implement PPPs (Van Den Hurk et al. 2016: 13). In such countries, organizations other than official CAs coordinate, drive, and shape PPP processes. In Belgium (Flanders), a government investment company (PMV) has been more active in coordinating and shaping PPPs than the official PPP unit. The PMV is very knowledgeable and experienced and regularly participates in coordination of large PPPs. The official PPP unit has played limited roles with only six staff. In Finland, there is no CA or PPP unit. In Estonia, there is a government-owned company (State Real Estate Ltd), a sophisticated, active, and expert player that coordinates PPP processes in real estate. Finland has well-trained government-constituted body of professional experts that provide a rigorous standardized cost-benefit analysis. They make PPP procurement and implementation successful. This body of field actors has been reliable and successful in coordinating PPP processes in Finland (Van Den Hurk et al. 2016: 8, 12). Bangladeshi CA has been less involved in PPPs. The National Investment Bank of Jamaica (NIBJ) performs coordination roles in PPPs than official CA; and in Portugal, the Parpública has become the new driver of PPPs (Van Den Hurk et al. 2016: 13; Sanghi et al. 2007: 3). Involvement of unofficial experts or experienced government bodies in PPP coordination in these countries emphasizes the importance of coordination in the success of PPPs.

However, in some countries, CAs are equipped with organizational, structural, and legal capacities to deliver successful PPPs without external help. The South African CA is central to successful development and implementation of PPPs. In the UK and the state of Victoria in Australia, CAs are major drivers of PPPs. The Korean CA plays a central role in PPP processes, and since its creation in 1999, PPP has become an increasing means of infrastructure and service delivery in the country (Sanghi et al. 2007: 3). On the contrary, the absence of specialized CAs, unofficial bodies, or government agencies to coordinate PPPs in some countries has affected successful implementation of PPPs. In the Czech Republic, when PPP became the best method for creating infrastructures, the government established a successful CA staffed by professionals. At some point, the government slowly lost interest in PPP programs. The CA became nonfunctional and eventually dismantled. However, since after dismantling the CA, the Czech government has made several unsuccessful attempts to implement PPPs without a CA, unofficial body, or experienced government agency in place to coordinate the process (Van Den Hurk et al. 2016: 12). This highlights the importance of coordination in PPPs by specialized CAs, unofficial expert, or experienced government agencies. Table 1 summarizes some studies on CAs and the results of PPPs that involved experienced CAs/PPP units, unofficial expert, or experienced government bodies and those implemented without CAs or expert bodies.

## Methodology

This chapter applies qualitative methodology to review secondary data on the failed DAWASA/CWS PPP. It extensively reviewed scholarly literatures and empirical studies relating to the failed PPP. Some PPPs implemented without CA were reviewed to find out why they succeeded and why others failed in the absence of a CA. The arguments and conclusions presented in this chapter are based on the reviewed secondary data. Information from the reviewed data were used to analyze the effects of poor coordination on successful implementation of the PPPs due to the absence of a specialized CA. Documents like those found from the World Bank, United Nations, and OECD and other reports on the DAWASA/CWS PPP were reviewed. In addition, this study analyzed the implications of EWURA's inactive role on the failed PPP and compared it with the success it

**Public-Private Partnership Coordination: Lessons from Tanzanian Water Sector, Table 1** The result of studies some PPPs implemented with and without CAs in different countries

| Country and year | PPP partners | Presence of a specialized CA, unofficial PPP expert, or govt. body | PPP project area | Level of coordination by a specialized CA, unofficial PPP expert, or govt. body | Outcome of PPP |
|---|---|---|---|---|---|
| Denmark 2002 | Farum LGA/FIH institute | None | Indoor sports arena and soccer stadium | No CA or PPP expert body, it was coordinated by inexperienced Farum LGA officials | Unsuccessful |
| UK 2002/ 2003 | Transport for London, London underground/ Metronet | None | Underground railway | No CA or PPP expert body, it was coordinated by inexperienced transport for London and London underground | Unsuccessful |
| Malaysia 1993 | Batu Pahat Municipal Council (BPMC)/ confidential private developer | None | Ultramodern bus station | No CA or PPP expert body, it was coordinated by inexperienced BPMC officials | Unsuccessful |
| Spain | Spanish govt./ some private companies | Yes, SEITT | Transport sector | Yes, actively coordinated by SEITT | Successful |
| Mozambique 1998 | Govt. of Mozambique/ private company | Yes, Water Supply Regulatory Council (CRA) | Water sector | Yes, actively coordinated by WSRC | Successful |
| Tanzania 2003 | DAWASA/ CWS | Yes (EWURA) but had no authority to function as a CA | Water and sewerage | No CA or PPP expert body, it was coordinated by inexperienced MWLD | Unsuccessful |
| Tanzania 2001 | GoT/TICTS | Yes (SUMATRA) | Maritime sector | Yes, actively coordinated by SUMATRA | Successful |
| Tanzania 2006 | GoT/ TENESCO | Yes (EWURA) | Electricity sector | Yes, actively coordinated by EWURA | Successful |
| Tanzania | GoT/private developers | Yes (local government authorities) | Land development, planning, and surveys | Yes, actively coordinated by local govt. authority personnel trained on PPP procurement and implementation | Successful |
| Tanzania 2009 | GoT/FBOs | Yes (TUC) | Higher education | Yes, actively coordinated by TUC | Successful |
| Tanzania 2007 | GoT/RITES of India | Yes GoT, MOID, and RAHCO | Railway sector | Coordinated by three inexperienced govt. agencies | Unsuccessful |
| Tanzania 1992 | NHA/private developers | No | Housing sector | Not clear | Unsuccessful |
| Tanzania | GoT/private sector | No clear information | Aviation sector | Not clear | Unsuccessful |
| Tanzania 2009 | GoT/FBOs | Yes (PPP office in MOHSW) | Health sector | Yes, actively coordinated by PPP office | Successful |

made as an active CA in other PPPs in Tanzania after the DAWASA/CWS PPP. This helped to find out why MWLD and DAWASA did not succeed in coordinating the PPP. This chapter also evaluated the roles of CAs in some successful PPPs across the world and related it to how absence of a specialized CA or agency with experience and knowledge of PPP procurement and management affected the DAWASA/CWS PPP. It compared the results of some PPPs that involved specialized CAs/unofficial experts or experienced government bodies and some that used inexperienced government agencies or personnel as coordinators after the DAWASA/CWS PPP. The result of the comparison helped to discover how specialized CAs, unofficial PPP experts, or experienced government agencies contribute to the success of PPPs. In some studies and countries, CAs are known as coordination units/agencies, PPP units, regulatory agencies, PPP office, etc. However, in this entry, they are referred to as coordination agencies.

## Implementation of PPP Success Factors in DAWASA/CWS PPP

This chapter analyzed how poor coordination in structuring and implementation of success factors affected the outcome of the DAWASA/CWS PPP. PPP success factors are considered important to the successful implementation of PPP projects. However, some success factors were not present in the DAWASA/CWS PPP framework. Those that were included were poorly structured and poorly implemented and could not have achieved the expected result. The failure highlights the need to involve capable CA from the early stages of PPPs. The success factors that influenced the outcome of the DAWASA/CWS partnership are discussed below.

## Sound Legal and Regulatory Framework

Evidence shows that the legal and regulatory framework of DAWASA/CWS PPP lacked any mechanism for monitoring and accountability to hold the government or private sector responsible and accountable for the project breach and failure. The contract had no implementable mechanism to stop illegal connections and prevent customers from refusing to pay water bills. It did not provide a window for dialogue with stakeholders on relevant issues capable of attracting opposition, for example, public resistance to private sector involvement, dilapidated state of DAWASA's infrastructure, and other unforeseen issues. Furthermore, the contract failed to put down a clear and transparent rule for dispute resolution (Triche 2012). There was no contract signed between DAWASA and BGT for the construction of delegated capital work (DCW) of $40.4 m. The contract had no mechanism of guaranteeing the quality of water CWS will provide. It was an airtight contract that lacked flexibility. Despite the flaws in the structuring, DAWASA held the contract rigidly and refused to bend rules when necessary (Qizilbash 2011). In PPPs, clarity in expectations for coordination and flexibility to collaborate by parties is important and should be clearly specified in the contract (Forrer et al. 2010: 481).

However, when EWURA started functioning as a CA in 2006, it organized programs to inform and educate customers on the need for private sector involvement in water sector. It also established Customer Consultative Council through which it resolved customer complaints. This helped to reduce public resistance to private sector involvement and significantly reduced water pipe destructions which CWS suffered when it was operating the lease (Triche 2012: 40). These two factors were disregarded in the DAWASA/CWS PPP, and they played significant roles in its failure. There was no CA to regulate activities of private and public sectors in the PPP. CAs create public vision for PPPs by establishing short- and long-term public interest in the project, describe the strategy for project actualization, and ensure public acceptance and cooperation toward the PPP (Corrigan et al. 2005: 2). Less than 2 years of operation, the minister announced the contract termination in May 2005. This shows lack of separation between coordination, policymaking, and politics in the PPP because

GoT through the PPP wanted to secure external loans and IMF debt cancelation to make a political point, as election was around the corner (WaterAid 2008: 13). A specialized CA would have ensured that the contract implementation followed established legal framework. The contract terms specifically stated that both DAWASA and any operator appointed by it be subject to EWURA's regulation. However, EWURA then had no legal powers to perform its statutory functions (Triche 2012: 6).

## Appropriate Risk Allocation

Every PPP aims to achieve value for money. This could be possible if risks are evenly distributed among partners. To achieve this, government is expected to accept those risks she can properly manage. Risks can be properly shared when parties have knowledge of possible uncertainties that might arise during project implementation. Such knowledge helps parties to devise best practicable method of risk allocation. In view of this, risk identification and classification is very important for PPPs to succeed (Nwokorie 2016: 5). However, in DAWASA/CWS PPP, concern for appropriate risk allocation was raised when the lease contract preferred by World Bank and other International Financial Institutions (IFIs) was opposed by GoT based on its high operator's risk. GoT was reluctant to accept the World Bank's lease model in place of management contract it opted for. Nevertheless, GoT yielded to the pressure to accept the lease model because it needed the US$143.5 million project fund and the subsequent US$3 billion debt relief from the World Bank and other IFIs (WaterAid 2008).

During the bidding process, Saur and Vivendi expressed concerns about high operator's risk. Their request to minimize operator's risks was turned down by DAWASA. This made them to withdraw from the process (WaterAid 2008; Triche 2012). The influence of financing institutions and aid agencies on the choice of the DAWASA/CWS PPP model contradicts procurement due process, which demands that projects must be subjected to procurement option pretest. Pretest procurement option guides government to select procurement model that will give most value for money. At this stage of the process, the role of a specialized CA becomes very important to ensure that risks are appropriately allocated according to individual partner's capacity and capability, to assess public and private sectors' institutional capacities to partner, and to assess the most efficient and effective model of PPP (Corrigan et al. 2005: 2). However, there was no agency to perform these roles in the DAWASA/CWS partnership.

Coordination agencies are legally empowered with commensurate authority matching what they are expected to achieve. If a CA is to provide quality control, it is given the legal authority to stop or alter a poorly designed PPP (Sanghi et al. 2007). If there was a CA in Tanzania at the time of DAWASA/CWS partnership, there is much evidence that it would have strongly resisted the lease model. It would not have allowed CWS to emerge as lone bidder and winner of the lease contract, considering that BGT did not pass the prequalification assessment. The high operator's risk raised by other experienced and qualified bidders, the fears expressed by World Bank and the transaction advisor on BGT's capacity to meet performance expectations, and the unreliable financial soundness of BGT's proposal would have provided good reasons for a specialized CA to stop DAWASA from signing the contract with CWS.

## Project Feasibility Study

Feasibility study is an important process in PPPs. It appraises the practical reality of a PPP project and explains its practicability or otherwise. It provides information on the institutional capacity and capability of stakeholders, as well as project value assessment, economic rationale, risk identification and allocation, stakeholder consultations, project affordability, financial model, project constraints, and conflict mitigation plans (Nwokorie 2016: 5). However, there was much proof of failure of due diligence during procurement stage by both DAWASA and BGT. BGT's acceptance to inherit DAWASA's dilapidated assets and poor

review of its staffing needs before inheriting the entire 1400 DAWASA staff showed poor feasibility by BGT. Without confirmation, it relied wholesomely on information from GoT, DAWASA, and World Bank on some critical aspects of the project during the contract bid. This could explain why BGT never saw the high operator's risk concern raised by Saur and Vivendi. This subsequently affected the capacity of CWS to execute the project.

CWS sought for review of technical and revenue terms of the contract, having discovered that information on DAWASA's revenue status was inaccurate, and DAWASA's equipment were in total state of disrepair. There was no way BGT could have made progress in such situation. However, DAWASA did not grant its request (WaterAid 2008; Qizilbash 2011). Similarly, DAWASA lacked sufficient knowledge of BGT's financial and technical capacity. At the procurement stage, a specialized CA weighs bidders' technical, financial, and business capacity during evaluation, before selecting a preferred bidder (Nwokorie 2016: 5). The uncompetitive procurement process landed BGT the lease contract, a company whose financial and technical capacity to deliver the project were in doubt (WaterWorld 2013; WaterAid 2008; Triche 2012: 14). An experienced CA would have investigated these and scrutinize other issues like BGT's poor experience in water PPPs, its poor technical and financial capacity, its appeal for risk mitigation by other bidders, its high valuation of DAWASA's decayed infrastructure, and BGT's suspicious cheap proposal. All these set the stage for the conflict and failure of DAWASA/CWS PPP.

## Competitive Bidding Process

Transparent and competitive procurement processes make PPP negotiation easier and provide conditions for successful project implementation. If the markets are large enough to attract more bidders like in Tanzania, low turnout of bidders could possibly arise from unattractive contract design (Nwokorie 2016: 3). The procurement process of DAWASA/CWS partnership lasted for 6 years, yet it was uncompetitive. Though the bidding was done three times, only three firms submitted bids. Interestingly, two withdrew midway. The process was not competitive in some respects. The second selection process became contentious and BGT withdrew, alleging that the contract favored Sour and Vivendi. During the third bidding process, BGT did not meet the prequalification criteria, yet it was prequalified. The financial advisor and World Bank recommended that BGT should provide a performance guarantee from its parent company, a condition other bidders fulfilled; but DAWASA ignored this recommendation. Some problems in the contract design made Sour and Vivendi to withdraw midway in the selection process (WaterWorld 2013). This led to the emergence of BGT as the sole bidder and winner, even though she did not meet the prequalification criteria.

The contract design and selection process of the DAWASA/CWS PPP were uncompetitive and unattractive. This marked the beginning of the conflict that characterized the implementation of the project until its cancelation. Uncompetitive bidding process and unclear and unattractive contract designs create conditions for failure of PPPs. Part of the traditional roles of CAs in PPPs is providing expert advice and technical support from procurement to conclusion and approving or rejecting PPPs at any stage, in-line with coordination functions. The professionalism, skill, expertise, and adherence to contract terms EWURA brought into DAWASA/Dar es Salaam Water and Sewerage Corporation (DAWASCO) PPP were clear indications that the faulty procurement process that characterized the DAWASA/CWS PPP would not have happened if EWURA had been functional. It would have resolved the conflict of interest that arose 6 months into the contract, when CWS requested for review of financial terms of the contract.

## Trust

Involvement of diverse actors, stakeholders, and parties in PPPs increases possibilities for

unexpected behaviors. To enhance continuity and successful implementation of PPPs, trust is important from the beginning. Building trust in PPPs requires regular commitment, interactions, and communication (Forrer et al. 2010: 481). Establishing trust in PPPs helps to minimize conflicts, stabilize partnerships, and enhance continuity of PPPs. From the procurement stage of DAWASA/CWS partnership to its termination, there was no sense of willingness by the parties to build trust. The bidding process was characterized by intrigues, distrust, and loss of confidence. Earlier in the bidding process, BGT alleged that the process and the contract were designed to favor Saur and Vivendi. Northumbrian, another company that signified interest in the bid, withdrew early in the process, followed by Saur and Vivendi. Having won the contract, BGT, which later became CWS, failed to create conditions for trust by failing to meet many of its obligations. Just 6 months into the partnership, it was already calling for a review of revenue and technical terms of the contract (Triche 2012). This situation created doubt in the minds of DAWASA and GoT. The earlier ignored concerns raised by the World Bank and transaction advisor on financial soundness of BGT's proposal and its capacity to meet performance expectations manifested early in the implementation stage.

A specialized CA would not have ignored the important concerns raised by the experienced stakeholders, which became the cause of the conflicts that killed DAWASA/CWS PPP. Due to lack of knowledge and experience, DAWASA and MWLD ignored important concerns raised by the World Bank and transaction advisor. These bodies were justified when CWS started asking for review of revenue and technical terms of the contract. When a PPP is not well structured, bidders may present incomparable or low bids, as a strategy to win the contract with a view to later resolve uncertainties through negotiation process. BGT's actions could be an indication that its low bid was a technical strategy to win the contract and use it as a starting point for further negotiations.

## Political Support

In developing countries, the importance of political support to the success of PPPs cannot be underestimated. Political support is one of the main drivers of an effective CA. They mitigate political or government-related risks in PPPs and make the interpretation of political information easier for private sectors, when analyzing political risks associated with PPPs (Nwokorie 2016: 6). As the government makes best use of CA specialist input into PPP policies, CAs bring continuous political support to PPPs. This makes them work effectively with government and private sector institutions. GoT was preparing for election when DAWASA/CWS partnership entered the second year. The success of the PPP to the Tanzanian politicians then was not important as winning the election. Despite CWS's poor performance and the poor water and sanitation situation in Dar es Salaam, no political parties in Tanzania mentioned water and sanitation as their priority policy objective. Only few candidates included water and sanitation in their campaign program. Even the ruling party did not see the success of the PPP as priority issue. Hence, the indifference of GoT to the tension CWS poor performance generated. In addition, the controversy between DAWASA and CWS over poor performance never caught the desired attention of Tanzanian Parliament. It was only featured twice at committee levels between 2003 and 2005. Interestingly, the minister who was coordinating the PPP unilaterally canceled it, instead of bringing political support and finding peaceful settlement to the conflict (WaterAid 2008; Qizilbash 2011). This is a clear indication that the partnership never enjoyed support from Tanzanian political institutions.

The minister's direct involvement in coordination of the PPP did not provide opportunity for objective and independent specialist assessment of events in the PPP. Events in the PPP were evaluated from the minister's perspective, and his interventions were for political gains, as he was unable to separate politics from coordination roles in the PPP (Triche 2012: 28; WaterAid 2008:

13). Due to the absence of a CA, there was no opportunity for an objective and independent assessment of events and peaceful conflict resolution by the parties in the PPP. A specialized CA would have acted as a bridge between the government and the private sector and bring the attention of GoT and other political institutions to the importance of the PPP project.

## Educating Community Stakeholders

In order to gain the support of local community stakeholders and minimize risk exposure, enhance success, and optimize return on investment in PPPs, educating community stakeholders on PPP projects in their localities is very important. Given the challenges associated with PPPs in water and sanitation, it was expected that before or after signing the contract, DAWASA and MWLD as government agencies and coordinator would consult and educate the people on private sector involvement in Dar es Salaam water and sanitation management. However, there was very little evidence of consultation with the public who had not been paying for water before the privatization (WaterAid 2008). This situation set the stage for the stiff opposition CWS encountered from customers within the period it operated the lease contract. CWS's efforts to restore piped water systems were resisted in parts of the city by citizens who were not familiar with paying for water. Sensing that improved water supply will cost them their means of livelihood, water vendors joined to undermine restoration of piped water supply and construction of water kiosks in most parts of the city. Efforts to reduce water leakages and disconnect illegal connections did not succeed because citizens vandalized the already dilapidated water pipes for "free water" (WaterAid 2008). This made it impossible for CWS to make any progress.

Due to lack of experience, none of the parties tried to address the concerns and fears of the people concerning private sector involvement in Dar es Salaam water and sanitation. Interaction with the people could have produced an agreement on water bill payment option(s) and method (s). This would have increased CWS's revenue and reduced water theft and water pipe damages by those stealing water from the pipes. However, when EWURA began to function as a CA, it put in place a process to inform and educate the public about the PPP in the water sector. This greatly reduced public confrontation against DAWASCO and helped DAWASCO to reasonably control water leakages and water pipe vandalism. It also led to increased revenue collection and reduction of water loss for DAWASCO (Triche 2012). By educating and involving community stakeholders in private sector participation, EWURA reached a consensus with the people, diffused their fear of exploitation, and gained their support and cooperation. This largely contributed to DAWASCO's success.

## Communication and Compromise

Regular communication and ability to compromise by parties in PPPs are necessary for success. Open communication among partners in PPPs provides a platform for problem identification and conflict resolution. Communication among partners helps to build trust, increase their commitment to joint interest, and enhance effective and efficient decision-making and implementation. It also creates willingness to compromise and collaborate to avoid unnecessary conflicts (Nwokorie 2016: 6; Forrer et al. 2010: 481; Corrigan et al. 2005: 25). Evidence of lack of communication and unwillingness to compromise by DAWASA and CWS manifested when CWS withheld payment of rental fee and lessor tariff to DAWASA as a means to get DAWASA's attention for a dialogue. The situation created financial crisis for DAWASA and increased communication gap between them. In retaliation, DAWASA imposed a penalty on CWS for withholding the fee. CWS refused to pay the penalty, thus worsening their poor communication.

The cancelation of the contract by MWLD was the final evidence of unwillingness to compromise by the parties (Triche 2012: 25). This shows poor relationship management, poor communication, and unwillingness to compromise by both parties.

At that point, in DAWASA/CWS PPP, the role of experienced CA was vital, since it has the authority to coordinate the activities of the two parties according to terms of the contract and draw their attention to, or possibly sanction, any of the parties whose activities are not in-line with the terms of the contract. Although EWURA existed at that time, it had no legal powers to function as a CA.

## Results and Findings

This chapter concludes that GoT's inability to make EWURA functional during the PPP created a coordination vacuum that made MWLD to assume coordination role in the complex PPP that he lacked the experience and knowledge to do. EWURA was established in 2002, to perform the following functions: licensing, tariff review and approval, performance monitoring, educating and liaising with customers to resolve customer-related issues, and ensuring quality, affordable, and sustainable energy and water services. However, EWURA was helpless during DAWASA/CWS dispute because it had no legal powers to function at that time (WaterAid 2008). However, in a similar PPP project in Mozambique, the Government of Mozambique created the Water Supply Regulatory Council (WSRC) from the beginning of the PPP and structurally and legally empowered it to coordinate in the entire PPP process. As a result, the same type of PPP project in Mozambique succeeded, while that of Tanzania failed.

Having learnt from the DAWASA/CWS experience, some PPPs in Tanzania have succeeded since after the DAWASA/CWS failure. The success of the Tanzania International Container Terminal (TICTS) PPP and the PPP for the management of the Tanzania Electricity Supply Company (TANESCO) shows the importance of coordination by an experienced body right from the early stages of PPP (Triche 2012). TANESCO was a huge success because while GoT continued financial investment into the electricity sector, EWURA ensured that both parties follow terms of the contract. Under the supervision of the Surface and Marine Transport Regulatory Authority (SUMATRA) as a CA, container operations in Tanzania's main shipping port (Dar es Salaam) were revitalized following 10 years of PPP with TICTS. In 2003, just 2 years after the contract, the number of ships visiting the port increased from 30 to 50 per month, containers handled increased from 100,000 to 165,000 per year, and time spent in container clearing significantly reduced to 22 containers per hour (Dickinson 2003). In addition, PPPs in land development, planning, surveys, as well as opening of roads within towns and villages in Tanzania's major cities have all recorded huge success because local government authorities have been trained to perform coordination functions in the PPPs.

PPPs in the Tanzanian health and education sectors have also been successful following the creation of PPP policy in 2009 that led to the establishment of PPP units. Due to the creation of specialized PPP office in the Ministry of Health and Social Welfare (MOHSW), comprising experts from public and private sectors, PPPs with faith-based organizations (FBOs) in the health sector since 2009 have been success stories (Mujinja and Kida 2014: 8). Likewise, PPPs with FBOs in higher education have been successful in increasing the number of students' enrolment into higher education in Tanzania and bridging the wide gap between male and female enrolments into higher education in the country, due to the active role of the Tanzania Commission for Universities (TUC) as CA coordinating the PPPs. Even though the increase in number of students enrolling into higher education in the country does not mean increase in the quality of higher education provided by the private sector, the PPP is however counted among successful PPPs in Tanzania (Mgaiwa and Poncian 2016: 7–15).

DAWASCO was created in 2005, following the termination of DAWASA/CWS contract. It took over operation from CWS the same year. Within 2 years of operation, DAWASCO's performance improved steadily and exceeded CWS's performance in 2 years as it operated the lease (Triche 2012: 35). In 2009, EWURA was already coordinating 20 regional water and sewerage authorities, 101 districts, small town sewerage

authorities, and other water suppliers. By 2010, EWURA started participating actively in regulating water retail prices. In order to ensure compliance, monitor performance standards and quality, and make water affordable, in 2008 EWURA refused DAWASA's request to increase water tariff because DAWASCO had not met the annual performance standard for tariff increase. Preparing for 2009/2010 tariff increase, DAWASA and DAWASCO followed EWURA's guidelines in addressing operator's annual performance standard. This led to a remarkable increase in number of metered connections, distribution of customers' codes of practice, development of plan to reduce unaccounted water, and proactive customer outreach programs. Hence, EWURA approved the 2009/2010 tariff increase (Triche 2012: 40). EWURA's action improved the performance of DAWASA and DAWASCO. DAWASCO increased connections and reliability of water supply and devised means for poor customers to have access to water at an affordable price (Triche 2012). Though more need to be done in Tanzanian water sector, these improvements were recorded because EWURA a coordination agency began to coordinate the PPP. This makes coordination by specialized CAs, PPP expert, or experienced government bodies very important in PPP (Table 2).

The result of the PPP between GoT and RITES of India in 2007 explains the implication of non-involvement of a specialized CA, PPP expert, or experienced government body in coordination of PPPs. SUMATRA, which coordinates PPPs in Tanzanian transport sector, played no active role in the railway PPP from the beginning, whereas GoT, Minister of Infrastructure and Development (MOID), the bureaucrats in the minister's office, and Reli Assets Holding Company (RAHCO) coordinated the PPP process despite their inexperience. Just 5 months into the PPP, exactly the same condition that leads to the failure of the DAWASA/CWS PPP was repeated. RITES began to ask for contract renegotiation. This led to the protracted conflict of interest that ended the PPP in 2011 (Shlyk 2009: 33–43).

**Public-Private Partnership Coordination: Lessons from Tanzanian Water Sector, Table 2** Summary of result of some PPPs implemented in Tanzania with and without CAs, PPP expert, or experienced government bodies as coordinators after the DAWASA/CWS PPP

| Country | Presence of official CA, unofficial PPP expert, or experienced govt. body | Type of PPP | Level of coordination by official CA, unofficial PPP expert, or experienced govt. body | Degree of success |
|---|---|---|---|---|
| Tanzania | Yes (EWURA) but had no powers to function as a CA | Water and sewerage | Absence of a PPP expert body, coordinated by inexperienced MWLD | Unsuccessful |
| Tanzania | Yes (SUMATRA) | Management of container terminal | Actively coordinated by SUMATRA | Successful |
| Tanzania | Yes (EWURA) | Electricity sector | Actively coordinated by EWURA | Successful |
| Tanzania | Yes (trained personnel of local government authorities) | Land development, planning, and surveys | Actively coordinated by trained govt. authority personnel | Successful |
| Tanzania | Yes (TUC) | Higher education | Actively coordinated by TUC | Successful |
| Tanzania | Yes GoT, MOID, and RAHCO | Railway rehabilitation and reconstruction | Coordinated by 3 inexperienced govt. agencies | Unsuccessful |
| Tanzania | No | Housing | Not clear | Unsuccessful |
| Tanzania | No clear information | Aviation | Not clear | Unsuccessful |
| Tanzania | Yes (PPP office in MOHSW) | Health | Actively coordinated by PPP office | Successful |

The PPP in Tanzanian housing sector since the early 1990s has not helped in solving Tanzania's housing problems. Instead, more high-cost houses are built through PPPs. Since the introduction of PPP in the housing sector, no specialized CA or unit has been created to coordinate the PPPs. Due to poor legal frameworks and contract structuring, policy loopholes, poor risk allocation, uncompetitive biddings, poor project valuation, implementation, etc., which a specialized CA, PPP expert, or experienced government body can bring, the PPPs never achieved any positive result. In 2011, the GoT approved the establishment of a PPP coordination unit. Despite the establishment of the specialized PPP unit, none of the housing PPPs passed through the PPP unit. For example, the Dege Eco Village that was scheduled for completion in the end of 2016, 2017, and 2018 never involved the PPP unit. Although this project was said to be an ongoing initiative to provide decent and affordable housing in Tanzania, the income group it is intended for is however unknown. Like the previous PPPs, the price of the cheapest unit in this housing project is already above the reach of both medium- and low-income earners and cannot be counted as a successful PPP (Kavishe and An 2016: 980–981). Also, Kilimanjaro International Airport (KIA) PPP project was taken back by the GoT due to poor coordination because there was no CA to coordinate the process.

CAs have shown to bring expertise into contract preparation, financial and technical management, quality and performance monitoring, project evaluation, and partnership management in PPPs. Realizing the need for a specialized CA in PPPs, in 2011 GoT established a coordination unit to deal with promotion and coordination of all matters relating to PPPs in mainland Tanzania (Kavishe and An 2016: 980–981). In Spain PPPs succeeded without a CA because SEITT, a government institution, performed the duties of a CA. Nwokorie (2016), Mahalingam et al. (2011), Qizilbash (2011), and Sanghi et al. (2007) all pointed out the special roles of CAs in making PPPs succeed. In recognition of this, local authorities in the UK have been empowered to create PPP CAs to coordinate PPP projects. CAs in Leeds provide guidance, support, and advice on the appropriateness or otherwise of PPPs, financial, legal, management, and technical aspects of PPPs in the area. They guarantee consistency of approach across PPPs and ensure that PPPs follow the best practice and give advice on realizable timetable and budgets. They advise and inform appropriate decision-making bodies in the government on PPP progress. In South Africa, the South African treasury depends on the CA to determine if provinces can carry the costs of PPPs based on their future budgets. The role of South African CA in the development of PPPs in South Africa is central. The South African CA's involvement starts from completion of feasibility study to the signing of the contract. It continues by inspecting the quality, affordability and expected fiscal cost of PPPs and guides the PPP process by ensuring that the contract it developed is followed (Sanghi et al. 2007; Nwokorie 2016).

## Conclusion

Though there might be other hidden factors, DAWASA/CWS PPP failed mainly due to poor coordination as a result of the absence of a specialized CA, PPP expert body, or experienced government personnel to properly structure the contract and coordinate its implementation from the beginning. Poor coordination of the PPP manifested in poor management, conflicting interests, loss of trust, and suspicious behaviors by the partners from the procurement period to the cancelation of the partnership. The failure exposed DAWASA and MWLD's lack of knowledge and experience in PPP management. The success recorded by EWURA and SUMATRA in various PPPs in Tanzania as CAs, the success of the South African PPP CA, the roles SEITT played in the successful implementation of PPPs in Spain, and the responsibility assigned to local authorities in the UK to create PPP CAs show that CAs are important in PPPs' success.

## Introduction

During the last couple of decades, the public-private partnership (PPP) concept has gained grounds globally, and this is mostly realized in developing countries (Osei-Kyei and Chan 2017a). Many governments are now very enthusiastic about the concept, and different governments have varying motivations for adopting the policy. Nonetheless, developing countries have

huge infrastructure deficit coupled with rapid urbanization growth; therefore, the PPP concept is seen to offer huge relief. However, it should be mentioned that despite the commitment shown by many governments in developing countries, more projects are yet to be fully implemented. Developing countries are currently facing numerous challenges including corruption, lack of transparency and competition, risk misallocation, poor value for money, public agitations, and political opposition (Osei-Kyei and Chan 2015).

Like many other developing countries, the Government of Ghana (GoG) has also demonstrated great interest in the PPP concept (MOFEP 2011). Basically, PPP is defined within the Ghanaian context as "a contractual arrangement between a public entity and a private sector party with clear agreement on shared objectives for the provision of public infrastructure and services traditionally provided by the public sector" (MOFEP 2011). Considering this definition, Osei-Kyei et al. (2014) pointed out three key features of Ghana's PPP. First, it is a contractual arrangement between a contracting authority (public entity) and private consortium. The contracting authorities are mostly the metropolitan, municipal, and district assemblies (MMDAs), and ministries, departments, and agencies (MDAs). The private partner could be a developer or a multi-stakeholder consortium not run by the government (Pallister and Law 2006). It is worth noting that the private partner could also be either a nonprofit or profit-oriented consortium as well. Second, the arrangement involves the sharing of responsibilities and risks. This feature implies that there should be mutual agreement of objectives and responsibilities among parties. Hence, no partner should have authority over the other, and each partner should bargain on its own behalf (Akintoye et al. 2003). Lastly, PPP transaction involves a project which is conventionally provided by the public sector. Traditionally, there are specific public infrastructure projects which are provided by the government such as transportation projects (railway, highways, etc.), public hospitals, prisons, public recreational centers, housing, etc. These physical public infrastructures when adequately financed, constructed, and operated by the private sector could only be termed as PPP in Ghana.

In Ghana, the PPP ideology is not very new; this is because since the early 1990s, the private sector has been actively involved with public service delivery. However, the private sector's participation has mainly been the management of public service in the waste, energy, telecommunication, and sanitation sectors (Osei-Kyei and Chan 2016). Importantly, with respect to physical public infrastructure such as roads, railways, harbors and ports, airports, bridges, and public hospitals, private investors' participation have been relatively low. The government has been the sole provider for these physical public projects using the national budget and international donor funds (World Bank 2011). It has therefore become necessary in recent times for the government to engage the private sector to assist in the delivery of more physical public infrastructures, following the global financial crisis which has limited the flow of donor funds. PPP actually became a national policy in 2004, with a launch of a national policy guideline (MOFEP 2011). However, due to the lack of understanding and skills of local practitioners, the policy failed to become practicable (Osei-Kyei and Chan 2016). In addition, more institutional structures were not in place to allow the full-scale implementation of the policy particularly for physical infrastructure projects. In 2011, the policy was revitalized with a new national policy guideline. Further, a PPP unit (i.e., Public Investment Division) was established under the Ministry of Finance and Economic Planning (MOFEP) to spearhead the implementation of the policy. In March 2012, the World Bank agreed to support the PPP initiative by providing funds for the feasibility studies of some selected projects. In addition, the World Bank was committed to the enactment of a PPP law; however, since 2012, the PPP bill has not yet been passed.

Apparently, ever since the PPP concept officially became operationalized in 2011, only one PPP project, the US$115 m Seawater Desalination Plant Project at Nungua, is in operation. There are many physical public projects which are currently at the preparation stages and are yet to go through the full procurement stage (Osei-Kyei and Chan 2016). As a matter of fact, the pace of PPP

implementation in Ghana has been considerably slow, and more efforts from key stakeholders including the government, private investors, civil society groups, and academics are required. Therefore, this chapter examines critical issues in Ghana's PPP (i.e. motivations, obstacles, risks) and provides measures that will ensure the successful adoption of PPP in Ghana. Following this introduction is the key motivation/reason for PPP implementation in Ghana. The next section explores the major obstacles faced with PPP adoption in Ghana. The subsequent section discusses the risk factors and risk allocation mechanism for PPP projects in Ghana. Finally, the last section provides the best practices for PPP implementation in Ghana.

## Motivations for Adopting PPP in Ghana

Generally, governments globally have different reasons for adopting the PPP concept for infrastructure development, and the variations in reasons mostly occur between developing and developed countries (Cheung et al. 2009; Osei-Kyei et al. 2014). It is always important for practitioners to understand the motivations behind PPP adoption in a host country as this will aid them to develop performance objectives which meet the needs of the society and national policy. Essentially, the Ghanaian government has its own key reasons for adopting the PPP concept. The major basic reasons for PPP in Ghana are that PPP promotes the quick delivery of public infrastructure projects; it reduces government financial burden; and lastly, it allows for shared risks (Osei-Kyei et al. 2014).

***Promotes the quick delivery of public infrastructure***: In Ghana, public projects procured through the traditional bid-build method are often delayed due to several reasons including the lack of public funds, improper planning, and design variations. In this regard, the PPP ideology is seen as the alternative to offer the timely delivery of public projects. Because PPP contract bundles the design and construction of projects, there are little variations during construction compared to the traditional method. Further, private investors also need to recoup their revenue quickly; thus, they make sure that the public facility is constructed within the stipulated period or even earlier. Scoring political points is also another motive for using the PPP concept to ensure the quick delivery of public facilities. Always, incumbent governments aim to develop infrastructure in the quickest possible time to gain political advantage over their opponent in the next general election. As a result of this, the PPP is often used as the tool to achieve this ambition. A typical example was seen on the Ghana National Housing Project (GNHP) which was initiated in 2009. This project was a deal between STX Engineering and Construction Ghana Ltd. and the GoG for the construction of 200,000 housing units across the ten regions in Ghana. Though the project was unsuccessful as it was not implemented, the government attempted to use the PPP approach to fulfill its promise to solve the housing deficit within the shortest possible time. Essentially, the completion of the project would have given a huge political credit to the government in the subsequent election.

***Reduces government financial burden***: The World Bank has estimated that around USD 1.5 billion is required every year to bridge the infrastructure funding gap in the next decade in Ghana; thus, it has become important for the government to seek additional funding for public projects. The PPP concept is therefore seen as the innovative approach to make use of private finance in public infrastructure delivery. Aside from the huge funding gap, the Ghana Road Fund, Ghana Education Trust Fund, and other infrastructure funds are in serious deficit, and as a result, many local contractors are often not paid on time under the traditional bid-build method. This has ended up with many abandoned public projects particularly roads and public schools. More importantly, many local contractors are in bankruptcy and even some have been liquidated. Considering these, the PPP is the ideal option for the government to deliver the needed infrastructure in Ghana particularly in urban areas.

***Allows for shared risk***: Generally, risk sharing is a critical component of PPP arrangements and as the general rule of thumb goes "risks must be

allocated to the party with better mitigation techniques" (Ke et al. 2010). Unlike, the traditional bid-build system, where majority of project risks are retained by the public client, in PPP, the private partner rather retains large component of project risks. This therefore reduces the public sector's administrative costs incurred in procuring public facilities. The GoG has actually made it explicit that public departments/agencies should not engage in any PPP transaction which does not transfer significant amount of risks including financial risks to the private partner (MOFEP 2011). This is understandable because over the past years, contracting authorities in Ghana have failed to properly manage risks including financial risks allocated to them in traditionally procured projects. As a result, many public facilities are in deplorable states or are abandoned.

## Potential Obstacles in PPP Implementation in Ghana

PPP implementation in Ghana faces many obstacles as seen in many other developing countries. Essentially, the obstacles stem from many aspects which range from sociopolitical to organizational environments of PPP implementation. Nonetheless, the key challenges in Ghana's PPP practice include the lack of experience and appropriate skills in PPP delivery, misallocation and incomplete transfer of risks, and highly use of unsolicited proposals (Osei-Kyei and Chan 2017b).

***Lack of experience and appropriate skills***: Because of the complexities and large-scale nature of PPP projects, they require highly experienced personnel to handle and manage. As a matter of fact, most local practitioners both public officials and private investors in Ghana have very little experience in managing PPP transactions. The majority of public officers and civil servants are more familiar with the traditional approach compared to PPP arrangements, and this has contributed largely to the slow pace of PPP development in Ghana (World Bank 2009). Essentially, the lack of experience of local practitioners has been seen in some past projects including the GNHP. In that project, the conditions of contracts were not clear, and most of the contract agreements were more to the advantage of the private investor rather than the government. As a result, the contract was withdrawn from the parliament on several occasions. Also in another PPP project, the Nungua Seawater Desalination Plant, the public department (Ghana Water Company Limited) entered into a bad negotiation agreement in which many key risks including the demand and tariff risks were retained by the local authority instead of these risks been shared or completely transferred to the investor. This has therefore caused huge bankruptcy to the local government authority. Moreover, the private investor has threatened many times to close the facility down due to the nonpayment of debts by the local authority.

***Misallocation and incomplete transfer of risks***: Risk sharing is one of the critical features of PPP arrangements, in this regard; when risks are not properly allocated and completely transferred, it results to litigations and poor performance. Essentially, past projects' experiences in Ghana have demonstrated that risks are often poorly managed; in most cases, contracting authorities end up retaining excessive risks which is not supposed to be so for Ghana's PPP arrangement. In addition, risks are not often properly identified; emerging risks are not properly taken into consideration. A typical example is seen in the GNHP; in that project, the financial risk was actually shared between the government and the investor. Moreover, the demand risk was also retained by the government. This form of allocations put the government in a bad position to achieve value for money. In actual fact, it reduces the benefit of adopting the PPP concept for infrastructure development.

***Highly use of unsolicited proposals***: Globally, using unsolicited proposals for PPP implementation has been highly criticized for being a device which facilitates corruption. Unsolicited proposal is when a private investor submits a project idea/concept to a public department with the aim of developing the project through direct negotiation (Hodges 2003). Though many countries have introduced laws and regulations which guide the management of unsolicited PPP proposals, Ghana

does not have any adequate measures for such approach of implementing PPPs. However, this method of implementing PPP has been the preferred approach by the government and other local departments. The use of unsolicited PPP proposals undermines transparency and affordability. In actual fact, unsolicited PPP projects have conditions which favor investors rather the public authority and general public. A typical example was the GNHP which failed. It was directly negotiated with the proponent without any competitive and transparent tendering process. In this regard, the estimated price of a house was very high, and certainly, it would have been difficult for an ordinary person to purchase.

## Key Risk Factors and Risk Allocation Mechanism for PPP Projects in Ghana

Given the poor environmental and sociopolitical conditions of PPP in Ghana, there are many risks which affect the concept's success. Moreover, it is also essential for practitioners to understand the possible allocations and sharing mechanism for some key risks of PPP projects in Ghana. Osei-Kyei and Chan (2017c) explored the critical risk factors of PPP projects in Ghana, and their findings indicated that, generally, country-risk factors are more critical in Ghana than project-specific risks. Essentially, country-risk factors are risks, which relate to the political, legal, and economic conditions of PPP (Ameyaw and Chan 2015). The key critical country-risk factors which need attention in Ghana include corruption, political/public opposition, exchange and interest rate fluctuations, poor public decision making, political interference, and project approvals and permit delays. On the other hand, some project-specific risks which are critical and also need consideration include construction cost overruns, delay in project completion, change in market demand, delay in land acquisition, high financing cost, construction changes, poor quality of workmanship, tariff change, environmental risk, and inexperienced private partner.

Apparently, these risks are critical and therefore need to be allocated to the partner with better abilities to manage. It should be emphasized that not every country risk should be allocated to the public department as it is seen, and also not every project risk should be allocated to the private investor. In addition, contracting authorities should avoid transferring too many risks to investors because this will impede their performance. Therefore, as a general guide, risks such as exchange and interest rate fluctuations, poor public decision-making, political interference, project approvals and permit delays, political/public opposition, and delay in land acquisition should be allocated to the public sector because the local authorities are in a better position to manage these risks. Also, risks such as change in market demand, high financing cost, construction changes, poor quality of workmanship, construction cost overruns, and delay in project completion should be retained by the investor. Similarly, the private sector is in better position to mitigate these risks. For risks such as environmental risk, inexperienced private partner, corruption, and tariff change, they should be shared among the public and private partners. However, it should be emphasized that conflicts are likely to occur, if a project party deliberately ignores risks which are critical or attempt to transfer risks which they have the capacity to manage.

## Strategizing PPP Projects in Ghana: The Best Practices

Strategizing and procuring PPP in the appropriate way are necessary to ensure the policy development. Moreover, it expands the investment environment of the host country and also offers more social benefits. There are critical elements and tasks that need to the done in Ghana in order to promote the PPP concept and ensure value for money. Some of the critical best practices include transparency and competition, favorable legal framework, right project identification, capacity building, extensive stakeholder engagement, and appropriate risk allocation.

***Transparency and competition***: Transparency and competition are critical to enhance the general public's confidence in public officials and, more

importantly, in PPP arrangements. Contracting authorities have to make contract information publicly available. In actual fact, authorities can do this without disclosing key contract details to the general public. In addition, competition is very essential to ensure value for money. Proposed projects have to be advertised and allow investors to bid under a competitive environment. Essentially, when there is competition, contracting authorities are always in a better negotiation position. Moreover, there will be alternatives to choose from. In situations, where unsolicited approach is adopted, the proposed project has to still go through a competitive tendering process without violating the intellectual property rights of the investor. Importantly, different competitive procedures could be adopted, and these include bonus point system, Swiss challenge, and best and final offer. Under no circumstance should unsolicited proposals be directly negotiated because past experiences show that they are not of value.

***Favorable legal framework***: PPP laws and policy frameworks are important to govern the implementation process. Currently, there is inadequate legal framework for PPP practice in Ghana. Ghana has only a national policy guide; however, the guide does not give many details as to how the implementation process is. More essentially, the guide does not clearly stipulate the procedures for managing unsolicited proposals, which are the widely adopted approach for PPP implementation by the government. The government needs to step up its efforts toward PPP by passing a PPP law. Moreover, there should be more guidelines which further explain the implementation design of PPP in Ghana. In addition, more policy guides should be introduced to provide the process and approach of implementing PPP at the local and central government levels. This is because PPP implementation at these levels is quite different; thus, the approaches and management at these levels will be different.

***Right project identification***: The right public facility has to be identified and procured using the PPP concept. Right project identification simply implies the selection of public facilities with strong technical, social, and economic rationale for PPP. In fact, most of past PPP projects implemented in Ghana have been on the basis of "campaign promises" but not from a well-structured infrastructure plan. Although Ghana has infrastructure and development plans, PPP projects are often not identified from these, and this does not allow the concept to grow effectively. Incumbent governments usually identify and implement projects based on their promises made during electoral campaigns; therefore, in situation where they are unable to complete the transaction, the project is abandoned by the next government or become distress. Notwithstanding, because PPP projects are not identified from a structured plan, they end up not meeting the core needs of the society in the long term. It is therefore important that a comprehensive national infrastructure plan which incorporates the ideas of all political parties and stakeholders will be developed so that the projects with acceptable needs will be identified and procured through PPP. It should also be emphasized that the plan has to be strictly followed irrespective of the political party in administration.

***Capacity building***: Enhancing the skills of local practitioners (both public officials and local investors) is important toward the growth of PPP in Ghana. Many local practitioners particularly public servants have very little idea and knowledge on the management of PPP projects. More importantly, engaging in competitive negotiation is sometimes a challenge. In this regard, seminars and short courses on PPP negotiations and general implementation approach should be regularly organized for practitioners. In addition, PPP should be made part of the university curriculum so that upcoming practitioners or graduates would be equipped before entering the job market. International exposure is also important; thus, international tours and exchange programs should be organized to expose local practitioners to the international best practices of PPP.

***Extensive stakeholder engagement***: External stakeholders play crucial role in the successful implementation of PPP projects. Essentially, stakeholders such as civil society groups, local commuters, and trade unions should be engaged

right from the beginning of the project. Local practitioners should actually desist from engaging external stakeholders at the later stage of the project development because it irritates the general public and fuels the negative public perception on PPP transactions. Different projects may have different approaches of engaging external stakeholders, but generally "community meetings" should be used at PPP projects initiated at the local government level. At the central government level, press conference is the ideal approach to engage the general public. This is because both print and online media are powerful means to communicate issues to the general public. It should be emphasized that at the local government level, engaging local chiefs is an ideal way of getting the local commuters on board. This is because traditional chiefs are very well respected and therefore they can play crucial role in engaging the locals.

***Appropriate risk allocation***: Proper risk identification and allocation cannot be undermined when practitioners want to achieve success (Osei-Kyei and Chan 2017c). Risks have to be properly identified and allocated to the best party. Essentially, contracting authorities should neither retain excessive risks nor transfer too many risks to investors. In fact risk sharing has to be balanced. It should not be seen as a way of favoring one party since this can result to conflict at a later stage. Past project experiences can be used to derive a comprehensive risk register. Also, contracting authorities should ensure that the risk register is often updated for specific sectors.

## Conclusion

PPP is an approach that the Ghanaian government has adopted to foster infrastructure development and meet the rapid urbanization growth in the country. However, there are many obstacles to the successful delivery of PPP projects. These actually stem from different sources. Notwithstanding, PPP is indeed feasible within the Ghanaian context despite the prevailing challenges; however, the concept needs proper restructuring before it can be successfully implemented. The key issues that practitioners need to look at carefully in order to succeed include transparency and competition, favorable legal framework, right project identification, capacity building, extensive stakeholder engagement, and appropriate risk allocation.

# Public-Private Partnership, Brazil

Sandro Cabral
Insper Institute of Education and Research, São Paulo, Brazil

## Definition

Public-private partnerships (PPP) are organizational arrangements involving private actors in the delivery of public services. PPP situates between full privatization and direct government provision.

## Public-Private Partnerships in Brazil: Past and Present

Like other developed and developing countries around the globe, in the past few decades, Brazilian authorities have been sponsoring increased participation of private actors in several economic and social activities. This movement started in the second half of the years 1980s with the first wave of divestitures of state-owned enterprises in pulp, mining, and metal industries and continued in the years 1990s in petrochemical, air space, defense, and civil aviation industries. Brazil was not also immune to the so-called New Public Management (NPM) principles. During the 1990s multilateral agencies such as the World Bank and the International Monetary Fund – in conjunction with Brazilian local authorities more sympathetic to a less prominent role of the state in economic activities – helped to shape alternative modes of public service provision in the country. In a large extent, the use of market mechanisms in the organization of collective issues reconfigured the relationship between public authorities, citizens, and service providers. Along these lines, the recourse to private firms and nonprofit organizations in the delivery of public services formerly provided by governments gained traction.

In 1995, Brazil passed a new legislation to foster private participation in infrastructure via regular concessions (Concessions Law 8987/1995). This legislation allowed public authorities to delegate to private actors the possibility of building, refurbishing, upgrading, managing, and maintaining new and existing infrastructure in myriad of sectors such as roads, rail, gas distribution, and parks. Under this type of public-private interaction, revenues to private partners in charge of the service provision do not come from public authorities. Instead, tariffs and contributions from service users along with ancillary revenues (e.g., advertising and commercial activities) are the main sources of income of private actors. Actually, public authorities can even receive upfront fixed payments in exchange of allowing private actors to exploit public services. For instance, the São Paulo state government in Brazil was particularly successful in expanding and improving the quality of its highway system through regular concessions. Lump-sum fees paid by winning bidders of the main state highways were employed to leverage the quality of local roads, which remained under the state responsibility. This arrangement helped to improve the overall road network in the state.

Despite these advances, the Concessions Law was not able to attract private funds to several public services, especially those in which the revenues from users and complementary sources were not enough to assure compatible return on investment rates. In some cases, public-private ventures require financial support from public authorities, at least partially. Prisons are good examples of services in which user fees and ancillary revenues are not possible and demand public funds to support not only facilities construction but also operation and maintenance activities. To circumvent this problem and to boost private provision in public services, the Brazilian federal government issued the Law 11.079/2004, the Public-Private Partnerships (PPP) Law. The PPP law allows the combination of public funds along with revenues from users to assure the financial sustainability of public-private ventures. It also permits governments being the sole responsible for payments to private actors during the contract, which may vary from 5 to 35 years. PPP contracts cannot be inferior to R$ 10 million (around US$ 2.7 million as of December 2018). Government commitments with PPP cannot exceed 5% of the public authorities' net revenues. An important innovation in the Brazilian PPP legislation is the PPP Guarantee Fund crafted to assure the payments of the government financial obligations. Considering the past records of default by a non-negligible portion of the Brazilian public authorities, such fund is crucial to reduce the costs of raising resources to PPP projects and to increase the attractiveness of private actors. The law also posits that PPP projects must be run by Special-Purpose Vehicles (SPV), which are organizations designed to deploy the several activities necessary to deliver public services. SPV normally involves organizations with different expertise domains and cannot have public organizations with the majority of the voting capital.

These two major legal advances boosted the number of concessions and PPP projects in the country. According to the World Bank, from 1995 to 2016, Brazil has recorded 1913 contracts involving public-private initiatives. The vast majority of partnerships were concessions in the electricity sector (around 50%). Transport (roads, rails, ports, and airports) and water and sewerage account for 20% and 8% of the contracts, respectively (see the Private Participation in Infrastructure database in https://ppi.worldbank.org/). In the subset of contracts signed under the 2004 PPP legislation, as of 2018, Brazilian public authorities signed 104 contracts in several areas. Waste treatment, water, and sewerage accounted for 40% of the deals. Street lightening (11.5%) and health (10.5%) are also representative sectors for PPP. The remaining contracts are spread out in sectors such as urban transportation, service centers, football stadiums, housing, education, and prison services, among others (for further information on PPP contracts in Brazil, refer to www.radarppp.com). These numbers can be even higher if one considers other forms of public-private collaboration such as partial outsourcing, management contracts, and partnerships with private and nonprofit organizations.

State governments and municipalities of all Brazilian regions have been developing PPP projects, and these practices are not limited to center- or right-wing governments. Center-left and left-wing governments such as Bahia, Pernambuco, and Ceará are among the most active actors in the promotion of public-private initiatives. The increased legitimacy and the existing budgetary constraints faced by public authorities suggest that PPP are valid alternatives to improve public service standards and address citizens' needs. Nevertheless, despite the immense room for an even bigger number of public-private arrangements in Brazil, some factors may challenge an enhanced private scope in public services. In this vein, two critical factors arise: institutions and capabilities.

## Challenges to PPP in Brazil: Institutions and Capabilities

PPP are hybrid arrangements placed between privatization and in-house government provision in which public and private actors share decision

and property rights (Menard 2013). By combining resources and capabilities from different contracting parties such as private contractors from different sectors, public authorities in distinct levels, financial actors, and multilateral agencies, public-private arrangements are likely to improve public service performance and generate positive externalities (Cabral et al. 2013). Some factors are necessary to assure public value creation through PPP and concessions. First, contracts should be well crafted to infuse market incentives (rewards and sanctions) in the agents involved in the provision (Hefetz et al. 2014). Second, accountability structures are essential to not only impede collusion, patronage, and favoritism and foster ex ante competition but also to assure effective monitoring of the behavior of public and private actors during the contractual execution phase (Pierce and Toffel 2013). Third, the very existence of capable actors in the public and in the private sides working in an interdependent fashion are key factors to reduce contractual hazards and increase the legitimacy of these novel hybrid arrangements (Cabral et al. 2013).

Recent advances in the literature recognize that an enlarged private participation in public-private arrangements relies on improved institutions and capabilities (Quelin et al. forthcoming). In this vein, despite the increasing number of PPP and concessions observed in Brazil in the past few decades, some actions to improve the business environment and to ameliorate the institutional safeguards are necessary. A major concern of private actors involved in PPP and concessions projects relates to government opportunism (Spiller 2010). Actually, rent-seek behavior, ideological beliefs, or even the mere absence of cost-benefit analysis can stimulate public authorities to capture the rents created through efforts of PPP contractors or impede the SPV to meet the required contractual standards, thus jeopardizing the expected profits and the public value creation. In Brazil, private actors include the potential hazards of expropriation in their balance sheets, which leads to projects that are more expensive or to initiatives that are not viable from the economic point of view. The existence of preferential treatment to selected and well-connected groups in the Brazilian public procurement context may also contribute to a less competitive business environment and make some private actors refrain to invest in the country (Inoue et al. 2013). Brazil also needs to reinforce the existing regulatory, watchdog, and law enforcement agencies to foster a more predictable environment that stimulate private parties to invest in long-range projects. The emersion of unforeseen regulations, claims for tariff waivers, and additional constrains that threat both construction deadlines and financial equilibrium of the PPP contracts suggests that the quality of the Brazilian institutions is low. Under this scenario, private investors will tend to allocate their funds in more stable settings, in which the likelihood to obtain the expected returns is higher (Quelin et al. forthcoming). In other words, a more predictable institutional environment is necessary to more concessions and PPP initiatives in the country.

Additional investments in public-private initiatives are dependent on how capable are the involved stakeholders. On the public side, capable officers might be able to design adequate PPP proposals, conciliate business and citizen needs, navigate in the complex web of bureaucratic procedures, make necessary efforts to attract private funds to public-private ventures, and ensure that the contractual obligations of private partners will be accomplished. The creation of specialized pockets of efficiency in the public bureaucracy, the so-called PPP units, is crucial to more effective public-private initiatives (OECD 2010). These bodies play a leading role in the coordination and the incentive alignment of the different public bodies involved in public-private initiatives. Brazil has some examples of successful PPP units at both state level and local levels that were able to overcome the fragilities of the institutional environment in order to deliver interesting solutions, such the PPP units in the states of São Paulo (roads, housing, mass transportation) and Bahia (health, mass transportation, waste treatment). Nevertheless, the absence of stable structures with insulated officers to manage

relationships with private actors and other public agencies signals precaution because the positive effects of enhanced capabilities through PPP units are stronger exactly in contexts of low institutional quality (Quelin et al. forthcoming). Having said that, the existence of capable PPP units is crucial to expand private engagement in PPP projects in the country. On the other hand, the absence of these bodies is likely to challenge additional public-private initiatives in Brazil.

On the private side, contractors must possess the necessary capabilities to execute their tasks in order to address both the public interest and their own private objectives. Private partners with more experience in dealing with governments in public-private relationships tend to present superior partnering capabilities, experience superior performance, and capture more value from PPP and concession arrangements (Arino and Reuer 2004; Kivleniece and Quelin 2012). These enhanced abilities can also help firms to anticipate contractual hazards that may threat the accomplishment of contractual obligations in public-private relationships (Fabrizio 2012). In the aftermath of the Car Wash Operation – a massive anti-corruption started in Brazil in 2014 that banned several deviating firms from public-private contracts and incarcerated politicians and bureaucrats – the existence of capable suppliers who have improved operational and partnering capabilities in the public-private realm is an essential aspect for further development of successful initiatives in Brazil. Efforts to assure a competitive environment can attract service providers with accumulated knowledge to PPP bids in Brazil and help these firms to deploy their improved abilities in the pursuit of the public interest.

## Conclusion

In the past few decades, Brazil has been promoting private participation in services normally provided by public authorities through several organizational arrangements involving joint action of public and private actors. These include concessions and public-private partnerships (PPP). This entry addressed the history, the drivers, the existing numbers, the challenges, and what needs to be done in order to leverage PPP in Brazil. In this sense, building an improved institutional environment and reinforcing the existing capabilities in the public side to design, negotiate, and monitor PPP and on the private side to execute PPP in an adequate fashion are critical factors.

## Definition

Public-private partnerships are collaborative arrangements between public and private actors, comprising several models with different characteristics.

## Introduction

Public private partnerships (PPPs) emerged as a widely used governance arrangement in the past couple of decades (Wang et al. 2018). Understood, broadly, as a form of collaboration between public and private actors, PPPs have become a recent source of economic pressure and political concern for many governments. Despite their potential gains ascribed by the literature, the empirical evidence concerning PPPs good performance is fuzzy at best (Hodge and Greve 2017).

They also comprise several models and characteristics, stressing the need to notice in each research the attributes of the PPPs under study and to take careful action when comparing national and international cases. Academy still debates what should be the use of the concept and if some of the current schemes of PPPs should be using this label at all.

The purpose of this contribution is to help clarifying what PPPs are and are their main models, to explain the theoretical background that allows the understanding of how they act and to list the main critical factors to their performance.

This contribution structures as the following: the next section is dedicated to defining PPPs. Two major types of PPPs are distinguished – contractual and co-organizational PPPs – with their main attributes being discussed in the text. The following section brings some theoretical insights. Against a New Institutionalism approach, Transaction Cost Economics (TCE) and Principal-Agent Theory (PAT) are used to explain how partners act and in what topics critical pressures and pitfalls can emerge. Before the concluding lines, critical success factors ascribed by the literature are listed and discussed considering contractual and co-organizational PPPs features.

## Defining Public-Private Partnerships

Public-private partnerships are governance arrangements broadly defined as forms of collaboration between at least a public and a private actor. At the international level, they comprise a variety of models and schemes, such as concessions and other contractual arrangements (e.g., Private Finance Initiative – PFI), joint venture (e.g., mixed enterprises), and other co-organizational forms of cooperation. Noticing this heterogeneity, authors refer to the concept as an "umbrella" concept (Renda and Schrefler 2006), whose terms are defined by what each national jurisdiction determines (Hayllar and Wettenhall 2010). Academy still debates the precise meaning of the concept, its historical roots, and if they are indeed a newly governance arrangement to the provision of public infrastructures and/or public delivery (Hodge et al. 2010).

Hodge and Greve (2007, p. 547) assert the most consensual definitions of PPPs are those who see them as: (a) institutional cooperation for co-production and risk sharing; (b) long-term contracts for public infrastructure; (c) public policy networks; (d) civil society and community development; and (c) urban renewal and development.

The European Union distinguishes between "purely contractual" and "institutionalized" PPPs. The former are long-term contracts, while the later result in a third entity, a joint venture of public and private capital (Commission of the European Communities 2004).

Despite the different classifications of PPP types, authors tend to converge to the distinction of two major types of PPPs: contractual PPPs and organizational cooperation forms or alliances. Contractual PPPs can be defined as principal-agent relations where formal agreements clearly identify all risks, responsibilities, resources, and revenues of each partner. Interaction between partners is more limited and restricted to the initial phase of the partnership (i.e., contract negotiation) and generally objectives or the terms of the public provision are previously defined by the public partner (Klijn et al. 2007).

In this context, public and private partners tend to be dominated by different interests: the public partner aims the public provision with effectiveness, efficiency, and economy of resources; the private partner is stimulated by an attractive return on investment (Klijn and Teisman 2005). As such, one can question partners' ability to find common and converging higher goals and whether if it is possible of overcoming any divergence or even conflict of interest emerging between both.

According to this concept of PPPs, they comprise the following characteristics (Yescombe 2007):

- Underlie on the existence of a contract between a public entity and, at least, one private actor
- Constitute long-term relations, generally lasting periods of 25–30 years
- Mean to fulfill public needs, by designing, building, maintaining, and operating an infrastructure or a service provision
- Transfer risks to private partners
- Depend, at least in part, on private financing
- Use a payment method based on results (quantity and/or quality of the provided asset) that can consist of direct fees from the users and/or transfers of the public budget
- Aim to obtain value for money to the public entity and profit to the private partner

On the contrary, co-organizational PPPs have greater interactivity and informality in the relationship between the actors. They tend to develop some fundamental rules for regulating the relationship between the partners in a formalized agreement, but they are more flexible and sustained by a strong sharing of resources, decisions, risks, and benefits (Kouwenhover 1994).

The strong interaction between partners demands for the development of mutual trust and the adjustment of the coordination mechanisms to fulfill the partnership needs. The involvement of private partners tends to emerge earlier than in contractual PPPs, even when the objectives are not clearly outlined. These PPPs have greater negotiation between actors, reflected in what may be a greater alignment of interests.

In summary, based on the above, we can identify as the main elements that characterize these PPPs:

- A lower level of formalization of the relationship between the public and private partners
- Greater frequency and flexibility in interactions between partners
- Propensity for the long term of the established relationship
- Co-production of public goods or services
- Sharing of decision-making, resources, responsibilities, and risks by partners
- Convergence of objectives and benefit sharing in the partnership

Having in mind the multiplicity of understandings associated with PPP, one can ask if the label should apply to all of them. Are all public-private mixes and hybrids included in the PPP concept? Alternatively, should the concept of PPP apply only to a specific type of public-private arrangement?

Noticing the absence of an extensive collaboration in some PPP arrangements, some authors question if they should be considered "partnerships" at all (Hayllar and Wettenhall 2010). Because of their traits, contractual PPPs resemble a form of "contracting out" (Teisman and Klijn 2002). They have a competitive nature (Wettenhall 2007). Institutional and

co-organizational forms of PPP fulfill better the conditions of "genuine partnerships."

In order to be called "genuine" partnerships, PPPs must bring together the following attributes (Wettenhall 2007, p. 395):

- Collaborative nature
- Horizontal relationship between actors
- Shared and consensual decision-making
- Absence of an entity vested with "higher" powers, specifically to invoke the termination of the relationship
- Existence of a shared management structure such as a partnership forum or board of directors
- Ability to achieve synergies between partners
- Respect and trust as ways to promote social capital

Following this line of reasoning, the main feature that distinguishes co-organizational partnerships from contractual arrangements is their collaborative or competitive essence. According to Milward and Provan (2003), competition and collaboration constitute opposing strategies to increase performance in the provision of goods and services by public entities. While networks of multiple actors place the emphasis on collaboration, in an attempt to achieve an integrated and effective approach to public policies, competition models of interaction demand the alignment of actors' incentives, requiring its correct formulation in established contracts.

The ambiguity of the concept produces misleading conceptions in the public as well. The concept gained political significance and could have been used to conceal the intents of privatization (Linder 1999). In politics, more important than a precise use of the concepts is the image they convey and that one intends to communicate. Concepts are "brands" made to evoke meanings and emotions that can attract supporters (Klijn 2010).

There were historical circumstances that led to the appropriation of PPPs in favor of political discourse. In the United Kingdom of the 1990s, an increasingly suspicious and unfavorable public opinion to the privatization discourse was gaining expression. The word "partnership" was evocative of more favorable feelings and emotions of citizens, which could be associated with the ideas of collaboration and sharing between public and private entities. So, when the Tony Blair's Third Way Government took power in 1997, it gave the initiative of PFI a new designation: public-private partnerships.

PFI started with the conservative Government of John Major, consisting of an instrument to guarantee private investment for the provision of large public infrastructures, without burdening public accounts. The private sector designs, builds, finances, and operates an infrastructure (DBFO model), whose ownership is transfer to the public partner at the end of the contract, lasting usually 20–30 years. Unlike concessions, in the PFI model, private sector remuneration consists of regular payments by the public partner, during the term of the contract (Corner 2005).

It was during Blair's Government that PFIs went from a poorly implemented policy to an instrument with exponential growth in the context of the British administrative reform. However, its conservative origin was somewhat embarrassing (Coghill and Woodward 2005, p. 81), and the labor party wanted to depart the initiative from privatization. The solution found was to put a new label to the initiative. It was with this new name that PPPs were projected and internationally disseminated (Hellowell 2010). The possibility of providing citizens with new infrastructures, without burdening public debt, made PPPs very attractive to governments of many countries, regardless of their political orientation.

For this reason, authors mention a "language game" (Linder 1999) when referring to PPPs. They can be a euphemistic way of designating privatization, seeking to cover up the governments' intents and to unclear public understanding.

## Using Contractual Approaches for the Understanding of PPP

Comprising several models and schemes, PPPs obey to different institutional arrangements. Contractual approaches, such as Principal-Agent and

Transaction-Cost Economics theories, become particularly useful to understand interaction dynamics in PPPs. According with these theories, most of PPP's hazards result from their long term associated with uncertain and unpredictable events. Contract's incompleteness creates high transaction costs and the existence of asymmetrical information can originate opportunistic behavior by private partners.

PPPs rely on formalized agreements to a greater or lesser extension. Contracts can be defined as agreements between a seller and a buyer that state the terms of the delivery (quantity, quality, price, delivery time, and so on) of a product or a service. Classical and relational contracts are opposite because the first require the settlement of all the necessary specifications to bind the parties (Greve 2008). Relational contracts, on the contrary, have implicit terms and usually confine written agreements to the main interaction rules (Mulgan 1997). A third, intermediate category – neoclassic contracts – derives from the impossibility of specifying all relevant terms in some contracts due to unforeseen events.

PPPs tend to be long-term contracts of great complexity. Due to uncertain situations making impossible to anticipate all possible future events, PPPs become necessarily incomplete contracts (Hart 2003), omitting or being vague in several relevant matters (Tirole 1999). Partners generally incur in transaction-costs due to volatile circumstances and the presence of specific assets (Zheng et al. 2008).

In TCE, Williamson (1985) sought to define the most efficient governance structures based on the costs occurred during transactions. According to the author, PPPs are hybrid forms situated between market and the firm, relying in the establishment of credible commitments – the ability of the parties to develop a conduct based on honesty and collaboration – to avoid increased transaction-costs (Williamson 1999). As such, implicit elements of relational contracts would be an important complement to agreed formalized clauses (Coelho 2007).

According with PAT, enhancing private partners' performance will be largely a matter of having the right incentives. In these relationships, agents should act in the interest of the principal (public procurer), in exchange for an agreed payment (Gormley and Balla 2008). Due to information asymmetry and against its own needs and desires, the question is whether the agent (private consortium) will have adequate incentives to meet public partner's expectations (Shapiro 2005). The principal faces the risks of adverse selection (i.e., selecting its agent without the knowledge to evaluate the full extension of risks he represents) and moral hazard (opportunistic behavior accordingly with agent's interest and aiming to maximize its benefit/utility) (Eisenhardt 1989). Consequently, PPP contracts tend to be armed with clauses to deter agent's noncompliance, imposing means for principal monitoring and sanction. On the other hand, they create positive incentives (rewards) for good performance (Gomez-Mejia and Wiseman 2007). These mechanisms can be understood as enforcement strategies of deterrence and persuasion (Reynaers and Parrado 2016). The use of these two strategies may vary accordingly with the degree of dependence of the public procurer, trust between partners and the existence of clear performance standards.

Despite the above, in many PPP contracts, partners seek to define the most they can the necessary specifications of the relation. These will be the case of what was previously defined as contractual PPPs. Due to their long-term duration that makes impossible to predict all likely events that may occur in the future, these PPPs assume the form of a neoclassic contract. Co-organizational PPP, such as institutionalized PPP or what previously defined as "genuine" partnerships, should rely on relational contracts.

Relational elements of contracts aim at a more flexible interaction. Flexibility gives a certain freedom of action so that partners can handle new circumstances and to adapt (Cruz and Marques 2013b). Due to long duration of contracts, it will be almost inevitable that, at some time, renegotiation events will occur (Domingues and Zlatkovic 2015). The rigidity associated to contractual PPPs makes these events (formal

renegotiation and/or court litigation) extremely costly because the high transaction costs generated.

Relational contracts, on the other hand, require increased confidence and sense of commitment to prevent opportunism. Trust encompasses actors' expectations (perception of trustworthiness), attitudes (benevolence), and behaviors (honesty, integrity) (Oomsels and Bouckaert 2014, p. 582). Trusting is taking a "leap of faith"; it brings vulnerability and risk to actors willing to do so (Edelenbos and Klijn 2007, p. 29). That is why trust is so hard to achieve. To protect themselves against these risks, most of times, partners seek to shelter contracts with safeguards. They "overwrite" contracts (Cruz and Marques 2013a), aiming "for completeness in order to decrease the number of unexpected and undesired situations" (Van Den Hurk and Verhoest 2016, p. 283). Consequently, though PPP contracts should be relational in theory, they tend to present "a neoclassical twist" (Greve 2008, p. 172).

In contractual PPPs, relational elements should complement formal clauses and act as an important signal of trust or distrust and commitment or noncommitment. That is, formal mechanisms are "crucial but not sufficient 'qualifier' for effective exchange and (...) need to act in combination with pro-active relational governance" (Zheng et al. 2008, p. 52). Amirkhanyan et al. (2012) reach a similar conclusion, supporting the existence of a complementary role rather than a negative association between relational and formal elements of PPPs. Their findings support the evidence that developing trust does not require less formalized agreements. Contrarily, thicken contract specifications may strengthen collaborative relationships by reducing actors concern with potential opportunism of their partner and by producing greater understanding of shared values and goals (those reflected in procedures).

On the other hand, Reeves (2008) concluded more transactional relations (prevalent in contractual PPP) were not an impeditive to good collaboration. Public actors entering a partnership showed preference for relying on more formalized terms regarding initial planning, rights and duties specification, the binding nature of the contract, and formal communication. However, because of the long term of the contract, complementary relational interaction was considered essential to successful collaboration.

## Critical Success Factors to PPPs

The literature ascribed several potential gains to PPPs when comparing to more traditional and alternative means of service delivery. PPPs allow private investment to carry out large-scale projects, leaving aside substantial State investment that can be redirect to other valuable missions of public interest in society (Cruz and Marques 2012). It is argued that PPPs provide better value for money (VFM), in view of risks transfer to the private sector (OECD 2008). Also, the private sector is seen as more efficient than the public sector when operating from a market perspective and with the objective of profit, being more prone to innovation and concentrating greater technical resources and specialized experience in the specific areas of the projects (Hofmeister and Borchert 2004).

However, empirical evidence concerning the performance of contractual PPPs is fuzzy at best (Hodge and Greve 2017). Considering the potential risks and "pitfalls" that arise and threaten PPPs good performance, several studies have been dedicated to identifying the critical factors for their success. Upstream and downstream factors that affect PPPs performance include political and institutional conditions, as well as the context to private initiative action. Table 1 summarizes critical factors for PPPs success.

Although they mean closer collaboration and can better match the objectives of both parties, co-organizational PPPs are also prone to failure. Its functioning is complex, given the involvement and frequent interaction of the actors, who more than sharing resources, responsibilities, and benefits, discuss problems and decide solutions. The preference for contractual modalities can then arise from the difficulty of implementing these partnerships, since they allow the public partner more control over public policy and the project to be developed in the PPP (Teisman and Klijn

**Public-Private Partnerships, Table 1** Critical performance factors for PPPs

| Critical factors | | Dimensions |
|---|---|---|
| *Political factors* | *Appropriateness of the PPP model for this project* | Favorable cost-benefit analysis in terms of the realization of the project<br>Correct estimate of the VFM for the PPP option (PSC)<br>Affordability of the expenses; technical viability |
| | *Political commitment* | Stable political situation (political regime and system)<br>Relative political and social consensus in terms of the projects that the PPP will perform<br>Sound PPP policy (clarity in terms of governmental positions and objectives). |

Source: Firmino (2018, p. 1273)

2002). To protect themselves against risk and vulnerability to the partner, many times actors choose to take individual strategies of distrust, missing out the opportunities to achieve collaborative advantages (Vangen and Huxham 2010).

Collaborative action should help surpassing each partner contribution by attaining realizations one could not accomplish (Huxham 2003). Good internal coordination and the management of the collaborative relationship of the partners become key aspects in the good performance of co-organizational PPPs. In addition, trust enables cooperation that is more successful in such arrangements.

However, several forces drive the appearance of inertia at the level of collaboration. In fact, many times the outputs of collaborative schemes take too long to be noticed or are insignificant, frustrating the actors and putting in evidence the tendency towards collaborative inertia. Achieving collaborative advantages requires building expectations over actors' reputation or formalized agreements. Expectancies about results should be modest and realistic at the beginning of the relationship, because only the development of trust will set the terms for a more ambitious collaboration in the future. To overcome inertia, partners must seek converging objectives, reconcile their organizational identity and culture, improve

the communication process, be highly committed, promote the distribution of resources and power, consolidate mutual trust, invest in a leadership of quality, and in promoting accountability, among others (Vangen and Huxham 2010).

## Conclusions

Defined as means of collaboration in its simplest form, PPP arrangements are endowed with great heterogeneity, comprising several models and acting in several areas of activity. This diversity of schemes gains prominence when observing the different national and international contexts.

PPPs were strongly associated with the idea of long-term contracts, but a broader understanding of the concept, and more in line with scientific literature, led to the inclusion, in its definition, of other forms of interorganizacional cooperation between public and private entities. In this contribution, these two main types of PPPs (contractual and co-organizational) were considered and defined, identifying their main traits referred by the literature.

PPPs were advertised as something positive when considering the value for money for the public sector. However, with the empirical evidence not being sufficiently conclusive, the idea of the existence of these benefits is more as a matter of faith than certainty.

The success of the collaboration depends to a great extension on the attributes of the PPP arrangements, where the level of formalization (the main attribute that distinguishes contractual and co-organizational PPPs) is an essential feature. When comparing contractual and co-organizational PPPs, one can observe that the former usually acquire a transactional (buyer-seller) and noncollaborative nature. Relying on relational governance structures above formal rules, co-organizational PPPs should show potential to overcome the dilemmas of contractual PPPs, concretely contract incompleteness. However, co-organizational PPP tend to develop collaborative inertia, since the establishment of common goals, trust, and commitment that support successful relationships take time and are hard to achieve between partners.

So, the literature has showed that contractual PPP cannot rely exclusively on formalized agreements, nor can co-organizational PPPs leave aside a contractual basis. Relational attributes are an important complement to formal clauses in contractual PPPs, improving partners' collaboration, through trust and commitment. On the other hand, formalized rules act as safeguards that reduce partners concern with the potential opportunism of their partners.

Aside theoretical contributions explaining how the contract's attributes interfere in PPP's performance, studies also have dedicated to identifying critical success factors of PPPs. These include features such as the appropriateness of the PPP model for the project (cost-benefit analysis, affordability, VFM), political commitment, transparency and accountability, a good regulatory framework, PPP units and the existence of technical expertise in the public partner, a competitive environment in the public bidding phase, and an appropriate economic context with support for private investment.

No matter the extension of the formalization in the PPP, partners should seek to take the most of collaborative advantages that might emerge from partnership relations. For that, they must aim at developing common goals and objectives, sharing resources, responsibilities and decisions, promoting mutual respect (identity, culture, reputation), having good leadership, and being committed and trustful of the other.

## Definition

There are various definitions of PPP; hence, a working definition is needed. PPP is "any arrangement between the government and the private sector in which partially or traditionally public activities are performed by the private sector" (Savas 2000: 4). PPPs have different synonyms such as P3s, Private Sector Participation (PSP) and Private Participation in Infrastructure (PPI). However, in common parlance and as it is in this chapter, the acronym PPP is used. PPP arrangements take many different forms, for example, DBFOM (Design, Build, Finance, Operate, and Maintain), DBFM (Design, Build, Finance, and Maintain), DCMF (Design, Construction, Maintain, and Finance), and DBFO (Design, Build Finance, and Operate). Others are PFI (Private Finance Initiative, mainly used in the UK), concession, leasing of public works, joint ventures, and public service contracts. PPPs are mainly used to procure economic infrastructure such as railways, roads, airports, and ports and key services such as health, education, water, and electricity. This development equally happens in both the global north and south as there is a move to leverage on private capital.

## Introduction

PPPs have an ages-old history, for example, they were used during the Roman Empire (27 BC-AD 4760. Even though PPP-style models of public investments have a long history, the acronym PPP gained currency in both academic and nonacademic circles in the 1970s, and, consequently, many books were being written on PPPs in the 1980s. However, the use of PPPs as an alternative to public-only investment saw phenomenal growth in the early 1990s with the advent of public sector reforms such as New Public Management. Following the launch of the Private Finance Initiative by the John Major-led government which involved the financing and construction of capital investment projects by a private company and the leasing back of the projects to the public sector over a predetermined period (usually, 25–30 years), the use of PPPs has gained

worldwide use. Today, PPPs are increasingly becoming popular tools to deliver infrastructure and public services around the world. Throughout the industrialized and developing world, there has been a renewed move to liberalization and privatization of infrastructure activities from the 1980s and increasing dramatically into the 1990s (PPIAF 2009: 35). The global financial crisis of 2007–2009 provided an impetus for the renewed interest in PPPs in both developed and developing countries, particularly, the latter. It is notable that developing countries, particularly in sub-Saharan Africa (SSA), disproportionately suffered the effects of the global financial crisis largely due to their monocultural economies (i.e., economies that are disproportionately reliant on one primary export commodity – e.g., Botswana is heavily dependent on diamonds). When the crisis hit, demand for primary export commodities such as base metals (e.g., diamonds) fell, leading to constrained fiscal envelopes. This fiscal reality forced primary products-reliant economies to look elsewhere for extra-public balance sheet financing of developmental and social infrastructure. Besides the foregoing, there is a general dissatisfaction with traditional public-only investment in the sense that there are deficits of Value for Money (VfM) (as measured in efficiency, effectiveness, and economy). Thus, it is contended that public-only investment, owing to, among others, bureaucratization (bureaucratic rigidity, hence, little flexibility in decision-making) and poor public project implementation, results in little VfM.

Given the incontestable fact that PPPs have been adopted as an alternative to public-only investment, what are the drivers for the increased uptake of PPPs? There are many works be they textbooks, research reports, journal articles, conference papers and Internet articles that discuss these drivers. Some examples are Chan et al. (2009) and World Bank (2016). According to Chan et al. (2009), drivers for PPPs can be grouped under five categories: (i) equitable risk-sharing (i.e., achieving substantial risk transfer), (ii) cost savings and Value for Money (i.e., cost savings, VfM, and cost certainty), (iii) enhanced asset quality and service levels (i.e., time savings, time certainty, innovations in public services, and better maintenance of assets), (iv) reduced public financing (i.e., reduced public funding), and (v) catalyst for the economy (i.e., encouraging cooperation and enhancing social development and business opportunities. In a similar vein, World Bank (2016), among others, lists the following drivers: (i) exploring PPPs as a way of introducing private sector technology and innovation in providing better public services through improved operational efficiency; and (ii) incentivizing the private sector to deliver projects on time and within budget.

The foregoing does not suggest that PPPs. are risk-free; they are heavily freighted with many risks (Zhang 2005). In this regard, Charles (2006: 693) counsels that "for PPP to be successfully initiated and implemented, the presence of a conducive and enabling legal and regulatory framework is a critical prerequisite." In a related vein, PPIAF (2009: 83–84) argues that the enabling environment for the successful implementation of PPPs is composed of four components. These enablers are (i) public sector commitment, (ii) effective risk management, (iii) legal and regulatory framework, and (iv) capable public and private sectors. Therefore, it can be argued a priori that in the absence of an enabling environment as argued by, for example, PPIAF (2009), PPPs cannot measure up to the task, that is, deliver as per expectation. In this regard, to ensure successful PPP enterprises, there is a need to grow an enabling environment *à la* PPIAF (2009) and avoid PPP potential risks as enumerated by, among others, Ika (2012), World Bank (2016), and Zhang (2005). Despite potential risks as manifest in Ika (2012), World Bank (2016) and Zhang (2005), there is a big push for PPPs in public procurement instead of traditional procurement (see Burger and Hawkesworth 2011).

## Comparing Traditional Public Procurement and PPP

When it comes to public procurement, the choice is often, at a broad level, between PPP and traditional public procurement (i.e., procurement that is solely publicly financed, mostly, using taxpayers money). Whether the government goes the route of PPP or traditional public procurement,

there are decisional guides. Although there are many decisional guides to public procurement, the most overriding one is Value for Money (Burger and Hawkesworth 2011). Therefore, any project, whether it is a PPP or a traditionally procured project, should be undertaken only if it creates Value for Money (Burger and Hawkesworth 2011: 1). What is Value for Money (VfM)? Good Value for Money is the optimal use of resources to achieve the intended outcomes (UK National Audit Office 2020). VfM consists of three constituent components: (i) efficiency, (ii) effectiveness, and (iii) economy. They are defined as:

*Efficiency*: the relationship between the output from goods or services and the resources to produce them – spending well

*Effectiveness*: the relationship between the intended and actual results of public spending (outcomes) – spending wisely

*Economy*: minimizing the cost of resources used or required (inputs) – spending less (UK National Audit Office 2020)

Besides the 3 Es, a fourth E, equity, is often added. *Equity* is the extent to which services are available to and reach all people that they are intended to – spending fairly (UK National Audit Office 2020). Given resource scarcity, particularly given post-2007 fiscal strictures that are largely attributable to the 2007–2009 global financial crisis, the worst crisis after the 1929 Great Depression, VfM issues are imperatively critical in public procurement. On a balance of probabilities and given the right enabling environment (see Charles 2006; PPIAF 2009), PPP procurement may confer more VfM as compared with traditional public procurement. Broadly speaking, a PPP may provide Value for Money compared to traditional procurement models if the advantages of risk transfer combined with private sector incentives, experience, and innovation – in improved service delivery or efficiencies over the project life-time – outweigh the increased costs of contracting and financing (World Bank 2013: 8–9). Therefore, a VfM analysis is critical for it helps governments to choose how to implement projects; PPP or traditional forms of public procurement? However, it is notable that the VFM analysis is only a part of the PPP project appraisal process that includes, among others, commercial, technical, and economic viability and affordability or fiscal responsibility (World Bank 2013). VfM analysis is not a perfect science for it is still evolving, but it is widely used in some regions; an example is the Organization for Economic Co-operation and Development region. Anecdotal evidence suggests that, overall, and given an enabling environment, VfM analysis demonstrates that PPPs are superior to traditional public procurement. Due to this superiority, and all things being equal, PPP procurement is favored over traditional public procurement. Hence, "governments increasingly use public-private partnerships (PPPs) to pursue value for money" (Burger and Hawkesworth 2011: 1).

It is notable that to maximize Returns on Investment, it is not enough to only consider VfM in public procurement. Hence, some works, for example, Dimitri (2013), talk about Best Value for Money (BVM). BVM is a multi-criteria approach that considers factors such as price/cost, quality, and sustainability to meet customers' requirements when deciding on procurement techniques: PPP or traditional public procurement? Therefore, BVM does not mean the lowest monetary cost but the best Return on Investment. BVM leads to Best Value Procurement (BVP), the antithesis of lowest-bid procurement. Thus, using VfM at a minimum, or BVM at a maximum, the weight of the evidence would recommend that public projects be delivered via the PPP vehicle. Given chronic resource scarcity in the developing world, particularly in sub-Saharan Africa (SSA), coupled with post-2007 fiscal strictures, the case for public procurement via PPPs in SSA is readily saleable as next demonstrated.

## The Case for PPP Procurement in the Developing World

The developing world is too broad a region to cover under one chapter; therefore, the focus will be on Africa, particularly sub-Saharan Africa

(SSA). The case for the adoption of PPPs in SSA is founded on many factors, but for brevity, this chapter will focus on three: (i) public project management maturity, (ii) post-2007 fiscal strictures, and (iii) COVID-19 pandemic.

It is trite that successful traditional public procurement is contingent upon many factors, the most important being public project management maturity. Public project management maturity refers to methodologies and processes that are used to implement public projects to ensure repeated successes as measured by VfM and BVM. These methodologies and processes are encapsulated in tools such as Governmental Project Implementation System (GPIS) and Governmental Project Management (GPM). While there are different experiences with public project management maturity owing to the diversity of the SSA subregion, the general picture is that of poor public project management maturity. As a result, a majority of public projects are not delivered as per the Project Management Triangle (called also the Triple Constraint, Iron Triangle and Project Triangle) of cost/budget, scope, or quality and time. Therefore, in a majority of cases in the SSA subregion, public projects, be they roads, dams, etc., are not delivered per cost/budget, scope/quality, or in time.

This foregoing issue was intensely highlighted through a concept note of the Pan-African Project Management Conference (PMC) that was organized in Yaoundé, Cameroun, in November 2016. The overarching objective of the first edition of the Pan-African PMC was to underscore the centrality of project management in transforming African economies. The concept note argued that a technological gap in project management in Africa existed. It further argued that the project management gap was apparent in four areas: (i) the participation of African countries in International Organization for Standardization (ISO) committees; (ii) the number of Project Management Institute (PMI) chapters in Africa; (iii) the number of International Project Management Association (IPMA) member associations in Africa; and (iv) number of universities and higher institutes whose project management training programs were accredited. In a related note, Ika (2012) is instructive. Focusing on International Development Projects, Ika argues that project management problems are due to the one-size-fits-all technical trap, the accountability for results trap, the lack of project management-capacity trap, and the cultural trap. Notably, project management capacity trap is one of the key causative factors of project failure. Hence, given these project management failures in SSA countries, PPPs are another solution in addition to reforming GPIS and GPM.

The global financial crisis (GFC) refers to the period of extreme financial stress in both global financial markets and banking systems between mid-2007 and early 2009. Some economists contend that the GFC was the most serious financial crisis since the Great Depression of the 1930s. As for origins, a downturn in the US housing market was a trigger for a financial crisis that spread from the USA to the rest of the world due to interconnectedness of financial systems as a result of economic globalization. Due to the nature of African economies, the majority of which are monocultural (i.e., relying on one major export – e.g., Botswana is overwhelmingly reliant on diamonds), they disproportionately suffered the effects of the GFC. The most significant effects were, still are, a decline in export prices and volumes. As a result, they are faced with reduced export earnings, hence, a reduced fiscal envelope. Reduced fiscal envelopes have ineluctably led to prolonged budget deficits. As an example, before 2008, Botswana enjoyed uninterrupted budget surpluses for over 20 years (see various budget reports). Post-2008, budget deficits are chronic. For example, as per the 2020/2021 Budget Strategy Paper, budget deficits will be Botswana Pula (1 Botswana Pula (BWP) = 0.084 USD.) (BWP) -1, 9819 million; BWP -6, 345 million, BWP -7, 7875 million; BWP -6, 9415 million; and BWP -4, 4066 million in financial years 2017/2018, 2018/2019, 2019/2020, 2020/2021, and 2021/2022, respectively. The situation in Botswana is replicated in almost all SSA countries. For example, as per the 2020/2021 South African budget speech, revenue is projected to be 1.58 trillion rands (1 South African Rand = 0.057 USD), or 29.2% of the gross domestic product (GDP), and expenditure is projected at R1.95 trillion or 36% of

GDP. This, therefore, translates into a massive budget deficit of R370.5 billion or 6.8% of GDP in 2020/2021.

The question is how do SSA economies plug budget deficits? Although there are many options, the most potent one is the usage of private capital. That is, the governments must tap into private capital to finance economic growth and development and also finance infrastructure. This will entail the financing of growth and infrastructure through PPPs. For instance, when delivering the 2020 Nation of the State Address on 13 February 2020, South African President, Cyril Ramaphosa, proposed that pension funds, including those in the private sector, should be used to finance parastatals such as Eskom (a state power utility company). In a related vein, the government of Botswana has decided that most capital projects during the 11th National Development Plan period, 2017/18-2022//23, will be delivered as PPPs. So, PPPs will allow SSA economies to finance projects off the public balance sheet.

Latterly, the world is faced with the coronavirus disease (COVID-19), an infectious disease caused by a newly discovered coronavirus. COVID-19 is an evolving situation, but there are signs that it will wreak havoc on the global economy. In this regard, the International Monetary Fund (IMF) forecasts a global recession in 2020, and that the effects of COVID-19 will be as deleterious as those of the last global economic crisis. As of writing this chapter (27 March 2020), nearly 80 countries have asked the IMF for emergency finance. Like it happened during the last global economic crisis, countries are cobbling up economic stimulus packages. For example, in early March 2020, the US Congress approved one trillion Dollars as a coronavirus relief package. The same is being witnessed in the developing world as next illustrated. On 24 March 2020, African Ministers of Finance announced the need for African counties to adopt an immediate emergency economic stimulus to the tune of $100 billion because of COVID-19-related economic disruptions. This call was contained in a press release issued after a virtual conference organized by the Economic Commission for Africa from its headquarters in Addis Ababa. The call also underscored the need to support the private sector and protect at-risk over 30 million jobs, particularly in the tourism and airline sectors across the continent, the two being major drivers of the economy beyond primary products. The foregoing augments individual country initiatives as next exemplified. On 2 March 2020, South African President, Cyril Ramaphosa, announced the establishment of a Solidarity Fund into which South African businesses, organizations, and individuals and members of the international community can contribute to fighting the spread of COVID-19. This is in addition to the government-financed stimulus package. In Botswana, in mid-March 2020, President Mokgweetsi Masisi announced that BWP 22 million had been set aside to fight COVID-19 and also stimulate the economy. It is within the realm of believability that other SSA countries, besides Botswana and South Africa, are cobbling up various economic stimulus packages to fight COVID-19 and also stimulate their economies.

Economic stimulus packages (ESPs) are usually huge projects (involving billions of US Dollars); therefore, the government cannot deliver ESP programs alone, largely, due to public project management maturity issues. The foregoing point was demonstrated during the ESP program that Botswana embarked upon in 2015–2018. The goals of ESP were to stimulate the economy; diversify the economy through Economic Diversification Drive (EDD) and Special Economic Zones (SEZs), and accelerate job creation. The government roped in the private sector to implement ESP projects. Hence, SSA countries must invite the private sector to help them implement COVID-related ESP projects via the PPPs vehicle.

## Way Forward in PPP Procurement

It is important to reiterate that PPPs are not silver bullets. Therefore, they are fraught with considerable risks that may make them less desirable than traditional public procurement projects. In this regard, first things must happen first to ensure the successful implementation of PPP procurement. For the sake of brevity, a few "firsts" (or fundamentals) are discussed.

*Enabling environment:* in terms of implementing any project, nothing is as important as an enabling environment. An enabling environment consists of two key components: (i) robust policy framework and (ii) governance institutions. Regarding a robust policy framework, this relates both to the regulatory and institutional architecture that spells out the rules of the game, for example, through PPP legislation (statutory acts) and regulations (these give effect to the act for the former is crafted in board strokes). In this regard, some jurisdictions have specific PPP laws, accompanied by attendant regulations. Some examples are Afghanistan (Public-Private Partnership Law 2016), Albania (Law on Public Procurement 2006), Angola (*Lei Sobre as Parcerias Público Privadas* [Law on public-private partnerships] 2011), and Benin (Benin Public Private Partnership Law [in French]). Likewise, PPP legislation must be guided by international guidelines such as UNCITRAL Guidance on Public-Private Partnership/Concession Laws (2000), EBRD Core Principles for a Modern Concession Law, and OECD Principles for Public Governance of Public-Private Partnerships. The United Nations Commission on International Trade Law (UNCITRAL) published a Legislative Guide on Privately Funded Infrastructure Projects in 2000. The purpose of the Guide is to assist member countries to establish a legal framework that guides private investment in public infrastructure. Concerning the EBRD Core Principles for a Modern Concession Law, the European Bank for Reconstruction and Development (EBRD) proposes a set of core principles as guidance for concession law. Lastly, the OECD Principles for Public Governance of Public-Private Partnerships provide concrete guidance to policymakers on how to make sure that Public-Private Partnerships (PPP) represent Value for Money for the public sector. Hence, PPP legislation must draw on the foregoing guidelines.

Regarding governance institutions, governments must establish departments (or units) that are solely responsible for PPP matters. In Botswana, for instance, a PPPs unit was established in 2016 in the Ministry of Finance and Economic Development to coordinate and oversee the implementation of the PPP Policy. Therefore, such PPP units must be established, given very clear mandates, and they must be properly resourced. Thus, they must be supported by adequate budgets and officered by staff trained in PPP management, not generalists.

In a related vein, PPIAF (2009: 83–84) counsels that the enabling environment for the successful implementation of PPPs is composed of four enabler components. These enablers are (i) public sector commitment, (ii) effective risk management, (iii) legal and regulatory framework, and (iv) capable public and private sectors. Therefore, there is a need to address these four when founding the enabling environment. Particularly, public sector commitment is key as one of the constituent parts of an enabling environment because, at times, governments say one thing but mean a totally different thing. Thus, the PPP enterprise must enjoy support from the first office as happened during the PFI initiative during the Major and Blair governments in the UK. Regarding risk management, it is trite that every endeavor, including PPPs, entails risk; therefore, effective risk management is key. A risk management framework for PPPs must entail some of the following tasks: identifying risks; analyzing risks; prioritizing risks (e.g., mapping out the top five risks); dealing with risks (deploying risk management strategies); and monitoring risks. Regarding the rules of engagement, a legal and regulatory framework is key. Lastly, the success of PPPs is largely contingent upon capable public and private sectors. In the main, they must be equal to the task of delivering PPPs.

Once the enabling environment has been founded, other things can be done. In this regard, the Governmental Project Implementation System (GPIS) and Governmental Project Management (GPM) need to be reformed because they are primary conduits for delivering public projects. Due to poorly functioning GPIS and GPM in a majority of SSA countries, public projects are rarely delivered as per the Project Management Triangle (called also the Triple Constraint, Iron Triangle and Project Triangle) of cost/budget, scope or quality, and time. PPPs demand high project management maturity as instanced by functioning GPIS and GPM; therefore, there is a need to make improvements in these project delivery tools.

Lastly, public project management reforms are imperative. From anecdotal data, it is adducible that, overall, public project management does not lead to Value for Money (VfM), at a minimum, and BVM (Best Value for Money), at a maximum. Hence, there is a need to improve public project management by, among others, introducing innovations such as Blockchain technology to deliver PPPs. Blockchain technology, based on peer-to-peer (P2P) networking, is a ledger system that allows data to be stored in many servers all over the world. This, therefore, allows anyone connected into the P2P network to see others' inputs in real-time. Among others, it is associated with decentralization, hence, improved operational efficiency. Although to date project management software is used, Blockchain technology is proving superior to the former, hence, suitable for use in PPP projects in SSA countries.

## Conclusion

Resource scarcity, particularly in an era characterized by post-2007 fiscal strictures, ineluctably forces to the fore the question: *how should public projects be procured*? The answer is often that the choice must result in Value for Money (VfM), at a minimum, or BVM (Best Value for Money), at a maximum. At a broad level, the decision envelope contains (i) traditional public procurement and (ii) PPP. Under the right circumstances, PPP is superior to traditional public procurement for it delivers superior VfM, or BVM. Sub-Saharan Africa (SSA) presents project management maturity challenges as amply instanced by poor Governmental Project Implementation System (GPIS) and Governmental Project Management (GPM), so, public procurement is the least efficient tool. In addition, post-2007 fiscal structures are commonplace in SSA. Post-2007, many monocultural economies in SSA are facing a decline in export prices and volumes. Therefore, there are acute financing challenges. Latterly, the COVID-19 pandemic necessitates economic stimulus packages that demand the participation of the private sector in public infrastructural projects. Thus, three factors, being project management maturity challenges, post-2007 fiscal strictures, and COVID-19 pandemic, provide a compelling case for the adoption of PPPs in SSA. However, a warning must be sounded that PPPs are not silver bullets for they are inherently risky. Therefore, although PPPs provide superior VfM or BVM compared to traditional public procurement, a few fundamentals, chiefly an enabling environment, are key. Once the fundamentals are in place, coupled with improvements in GPIS and GPM and adoption of Blockchain technology, PPPs will *potentially* lead to project success as per the Project Management Triangle. Should this happen, PPPs will deliver growth and development.

# Public-Private Partnerships in Kenya's Water Sector Management

Joseph Okeyo Obosi
Department of Political Science and Public Administration, University of Nairobi, Nairobi, Kenya

## Synonyms

Water governance; Water management; Water reforms

## Definition

Public-private partnerships is a form of management in which the government teams up with a private sector to deliver public goods and services. The partnerships may be in terms of shared responsibility, outsourced, joint-venture, leases, or even shared contributions as either jointly agreed or as per the terms of contract.

## Introduction

The provision of clean and safe water is both a human right and means to reducing poverty. Access to clean and safe water was one of the eight Millennium Development Goals (MDG) intended to facilitate reduction of poverty by 2015. The World Bank (Botting et al. 2010) observed that poor access to water supply often resulted from poor policies and management practices. As a means to enhancing access to safe water, Kenya introduced various management reforms in the water sector. Public-private partnership (PPP) became one of the outcomes of the reforms in the management of water sector.

Globally, different governments have adopted public-private partnerships strategies to attract private sector complementarity in designing, financing, building, maintenance of infrastructure, and even to provide operational services (Barlow et al. 2013). They exist in different types and sizes, and the boundaries between public and private are sometimes blurred, which makes them difficult to classify and to clearly define (Bakker 2003). Some scholars regard PPPs as a language game designed to "cloud" other strategies and purposes to the extent that a number of governments avoid using terms like "privatization" and "contracting out" in favor of partnerships (Hodge and Greve 2007). The approach to water management in Kenya appeared to, at least in design, have been influenced by the World Bank and UN Habitat support for integration of small-scale water service provision approach into the state support system. More focus was on facilitation of PPP to support communities and individuals in provision of water through vending and establishing alternative water supply sources (Mcgranahan and Kjellén 2006); expansion of services to help improve the services to the poor and those in the peri-urban settlement; legal recognition of the informal providers, development of cooperation of utilities, informal providers and government authorities, regulatory measures for pricing and quality, encouragement of the formation of vendor associations and partnering of local community-based organizations operations with international NGOs which facilitate technical and financial resources; and consideration of microfinance initiatives to facilitate their investments (Dagdeviren 2008).

The Kenya Water Act 2002 opened up to participation of the private sector, civil society, and communities in the management and

development of water resources. A variety of water projects in both public and private sectors were therefore initiated and operated in various forms of partnerships with no proper guidelines. Arising from the ambiguity of the policy, different types of private initiatives emerged in the water sector: Water Service Providers (WSPs), water service regulators, and water service provision financiers (Obosi 2011). There was no defined order and extent of interactions but a multiplicity of choices in each of the water projects, whether public limited companies which involved private competence or community-based water projects which at times involved government capital to expand the quality and production of public goods and services. The study therefore sought to investigate how public-private partnerships influence the management of water sector in Kenya. To what extent do PPPs permeate the water sector and with what results?

## Theoretical Framework

The study argues that a regulatory policy of the government influences the spheres of operation of public and private enterprises by determining their nature and scope depending on the latitude of interactions among the stakeholders in Kenya. Appropriate PPP therefore leads to better water service management by opening up to appropriate involvement of relevant stakeholders. Each Water Service Provider (WSP) is therefore free to partner with public or private entity for financial, developmental, or regulatory purposes as a way of enhancing its capacity for provision of public goods. The framework allows those not satisfied with the services of one service provider to seek better alternatives elsewhere. In Kenya, WSPs can be formed and operated by a community, a public, or private company whose operations are regulated by WASREB. The success of each WSP is dependent on the number of partners it successfully engages either as co-water providers or water provision financiers. Equally, water service financiers, like development partners, will only invest in the provision of water business if it guarantees good returns. The cost of water is likely to be cheaper at a WSP which has engaged more partners than that which has fewer partners. The consumers will then make their choices appropriately.

The argument is based on Public Choice theory as founded on choice of public goods as advanced by Buchanan (Bernholz 1980; Buchanan 2003; Crew and Rowley 1988; Mueller 2008; Ostrom and Ostrom 1971, 1977). A public good is anything that is at least partly rival and/or non-excludable in the sense that addition of new beneficiaries neither increases nor reduces the value of the good to the original beneficiaries. Public goods may be naturally available, produced by the government, produced by private individuals and firms, produced by non-state collective action, or they may not be produced at all. It is further hinged on an assumption that everyone in a community would like to make a right decision based on choices available (Mueller 2008). The need for public provision becomes necessary because of the difficulty in identifying the extent of need by an individual and how much should be shared. The study focuses on whose responsibility it is to provide water, who provides for whom, and at whose cost with what effects and what organizational forms (Kjellén 2006). Once privatized, water and sanitation are deemed to be economic or private goods, while at the same time considered social goods to which everyone should have a right of access.

The government of Kenya has subsidized production of water to increase access to a larger number of its citizen who could otherwise not have afforded its actual cost. It has equally attempted to regulate either the standards of production or service delivery of the public good as per policy as guided by either WASREB or Water Regulation and Management Authority (WARMA). Due to the high cost of investment in water infrastructure, the government has involved various development partners with different interests. It is incumbent upon each Water Service Provider (WSP) to pay regulatory charges to government agencies, seek financial support from governmental agencies including Water Service Trust Fund (WSTF), Constituency Development Fund (CDF), NGOs, and individuals to boost either infrastructural development or

maintenance. The consumers therefore opt for services from the most reliable, affordable, and easily accessible WSP.

## Methodology

A survey of seven Water service Providers (WSPs) of different categories under Lake Victoria South Water Board (LVSWB) was carried out in Kenya using both longitudinal and cross-sectional survey designs. Longitudinally, it was designed to assess the trend that has been observed between 2002 when water sector reforms were implemented in Kenya and 2012. The study looked at interactions among stakeholders on two fronts: first, between public limited companies and community water projects and secondly, Water Service Providers in different areas within the Water Service Board. The basis of the survey was the Impact Report numbers 3 and 4 published by the Water Services Regulatory Board (WASREB) in Kenya on water access and management in Kenya. The performances were ranked by WSB and WSPs nationally for 2007/2008 and 2008/2009 financial year, respectively.

The study used stratified random sampling method to select Chemosit and KIWASCO from the large stratum, SNWSCO from medium stratum, MIKUTRA from small PLCs stratum, and Nyasare, Boya, and Mogombet from the community water projects category. Care was taken to ensure that the community water projects were selected from each area covered by a sampled PLC for comparison of purposes.

A total of 7 FGDs comprising 8 members (water vendors/retailers, consumers, officials of a WSP, community leaders) and 33 key informant interviews 3 from each WSP were conducted. The interviewees were each asked to explain the governance structure and the operations of the WSPs through an interview guide with focus on the stakeholder interactions. The data collected from key informants and focus group discussions were transcribed and analyzed. Areas of convergence were then established using axial coding method and a report produced showing extent of interactions and involvements over time and space.

## Results and Discussion

The study established that public-private partnerships permeated water management in Kenya and determined the quality of water service provision. The involvement of PPP is evident in the interactions among the actors: service providers, financiers, and regulators which in turn shapes its nature and scope.

### The Nature of Public-Private Partnerships Management

Public-Private Partnerships occurs at various levels of management depending on the flexibility and innovativeness of key actors in water distribution. The nature of interactions was both at institutional and governance levels with more at lower levels among WSPs. The absence of defined policy guiding the partnerships has influenced the formation of partnerships on either mutual or contractual basis for different purposes.

However, government institutions like WASREB and WSB lack the capacity to ensure sufficient water supply. They therefore tolerate partnerships with the private sector initiatives from nongovernmental organizations, community-based organizations, churches, and individuals. Figure 1 shows the institutional arrangements in the water service delivery process.

Figure 1 shows that WASREB is in charge of water service provision in Kenya. Through Service Provision Agreements (SPA), individual WSPs deliver water to the consumers on behalf of WSBs. A private WSPs could be an individual enterprise, community project, or a people's organization. The nature of public-private partnerships therefore revolves around the institutions of service providers and water regulation and development partners with the WSPs being central to the interactions with a lot of flexibility among the stakeholders. The public-private partnerships have been more on asset development than ownership even where government agencies like CDF and WSTF partnered with community water projects like the Mogombet WSP and NGOs like HORIZON 3000 and the Church (Catholic Diocese of Nakuru). The flexibility further

**Public-Private Partnerships in Kenya's Water Sector Management, Fig. 1** The nature of institutional arrangements of water service delivery in Kenya

enabled the privately managed public water companies like KIWASCO to partner with landlords in informal settlements to provide water through delegated management of water line and bulk meter management. This succeeded in enhanced revenue generation and reduced nonrevenue water in Kisumu city due to close supervision (Obosi 2017). The approach exhibited by Kenyan WSPs contrasted the Uganda case where the National Water and Sewerage Company (NWSC) used its own bureaucracy to sign performance contract with positive results through emphasized efficiency, competition, performance management, and entrepreneurialism (Mbuvi and Schwartz 2013).

Community water projects were more flexible in engaging public-private partnerships in extension of water provision services for neighborhoods' self-interest. It was therefore more likely to find reduced distance to water points in community water projects than in management contracts (Obosi 2014). This was contrary to other parts of Africa and Latin America, where for example, in Cochabamba, Bolivia, wealthy consumers and businesses received municipally subsidized water through a network for resale to the poor who relied on water delivered by tanker trucks, private wells, or small-scale, community-run water systems (Bakker 2008).

## Scope of Public-Private Partnerships

The scope of public-private partnerships among the stakeholders depended on the nature of each WSP and the extent of interactions among the partners as either interventionists or facilitators. A schematic presentation of the areas of interactions within the water service provision is as shown in Fig. 2.

Figure 2 shows that public-private partnerships occurred in water service regulators, Water Service Providers (WSPs), and water service financiers laterally and within each entities even in the cases where several actors converged at one WSP. Several public-private partnerships were identified and summarized as shown in Table 1.

Table 1 shows that partnerships within water service provision were both governmental and private and existed in ownership, licensing, service provision agreements, subsidies, and distributions in not only the community water projects but also in the public limited water companies. The extent of interaction by WSP were identified and summarized as shown in Table 2.

Table 2 shows that whereas all the WSPs interacted with WARMA and WSBs, Boya, KIWASCO, and SNWSCO did not interact with WRUAs. This was a further indication of flexibility in terms of establishment of partnerships notwithstanding the regulatory requirements.

**Public-Private Partnerships in Kenya's Water Sector Management, Fig. 2** The scope of PPP in water service delivery in Kenya

**Public-Private Partnerships in Kenya's Water Sector Management, Table 1** The scope of partnerships in Water Service Providers.

| WSPS | Form | Partners | Scope of PPP |
|---|---|---|---|
| Kiwasco | Management contract | Government, private managers, community water point owners | Water kiosks, subsidy to informal settlements, revenue collection, government ownership, WARMA, service provision agreement |
| Chemosit | Management contract | Government, private managers, community | Water schemes, WARMA, government ownership, service provision agreement |
| Boya | Private venture | Government, community, NGOs, church | NGOs, CDF, WARMA, community ownership, service provision agreement |
| SNWSCO | Management contract | Government, private managers, community water point owners | Water kiosks, subsidy to informal settlements, revenue collection, water schemes, government ownership, service provision agreement |
| Nyasare | Private venture | Government, community, NGOs | NGO, community participation, community ownership, water kiosks, service provision agreement |
| Mikutra | Management contract | Government, private managers, community water point owners | Water kiosks, subsidy to informal settlements, revenue collection, water schemes, government ownership, service provision agreement |
| Mogombet | Private venture | Government, community, NGOs, church | NGOs, CDF, Catholic Church, community participation, community ownership, service provision agreement |

However, some partnerships were imposed on the WSPs and were less active than the voluntarily established partnerships.

The government through WSTF also supported WSPs through WSBs, irrespective of whether they were community water projects or corporatized water utilities, hence making some partnerships independent of others even when dealing with same entity. Public-private partnerships for water financiers are shown in Table 3.

Table 3 shows that whereas peoples organizations are the most dominant partners in community water projects, development partners are more dominant in management contracts through Water Service Boards courtesy of international financial institutions offered development assistance through state undertakings or bilateral state negotiations for loans/grants. Others were non-governmental organizations and governmental organizations like CDF, WSTF, and local

authorities to help in boosting storage and network distribution, respectively.

## Conclusion

The paper has concluded that in Kenya, PPP has occurred in the management of the provision of water services in two ways: first, the government inviting private participation in water management through commercialization of government water utilities and secondly, the private water entities in the form of community water projects inviting public finance through government support agencies to enhance their enterprises for the good of the public. In both cases, the success of the PPPs are determined by the operations of existing government regulatory agencies to the

extent that the more rigid the regulations are, the fewer the public-private partnerships.

Again, most public-private partnerships in the water sector management in Kenya are in the form of associations as orchestrated through community water management approach not necessarily sanctioned by formal government apparatus. More private actors were therefore invited to participate in public enterprises. Sometimes, the private enterprises invite public participation in the form of funding and regulation from the government therefore reversing the role in provision of water as a public good. This is unlike the joint ventures, concession and leases

which features prominently in Anglophone countries and affermage systems in Francophone countries.

Since the community water management approach through the establishment of PPP have proven successful in provision of water in Kenya, the government should therefore focus on the provision of water through the community water projects by reinforcing community water management systems and enhanced funding for the projects. Unlike the government-identified community water points in Ethiopia, Uganda, and Malawi, the approach will imply government supporting the community to enhance the management of existing and operating choices.

## Definitions

| | |
|---|---|
| Public–Private Partnerships (PPPs) | These are partnerships between the public sector and the private sector for purposes of designing, planning, financing, and operating projects, which would be regarded traditionally as falling within the responsibility of the public sector. |

| | |
|---|---|
| Sustainable Development Goals | These are the blueprint to achieve a better and more sustainable future for all. |
| Sanitation | It refers to public health conditions related to clean drinking water and adequate treatment and disposal of human excreta and sewage. |

## Entry Chapter

The study examined the role of public–private partnerships in solving water and sanitation issues affecting Mvurwi town. A total of 144 questionnaires were administered to respondents across Suwoguru, Rusununguko Phase 2, and Pembi View. Purposive sampling was employed to select key participants such as the Town Secretary, and Community Services Clerk. The Statistical Package for Social Sciences Version 20.0 software was used to analzse data. Findings indicate that 66% of the respondents are directly affected by water and sanitation issues. Fifty percent of the respondents agree that public–private partnerships are essential in rehabilitating the water and sanitation sector in Mvurwi.

## Introduction

Public–Private Partnerships (PPPs) are partnerships between the public sector and the private sector for purposes of designing, planning, financing, and operating projects, which would be regarded traditionally as falling within the responsibility of the public sector (Farlam 2005; INWRDAM 2010; Hall 2012). According to Chiromo (2014), almost 50% of the developing world's population, that is 3.6 billion people, lack improved sanitation facilities, and almost 1 billion people still use unsafe drinking water sources, and even those with access often receive unsafe and inadequate service. Sustainable Development Goal (SDG) 6 emphasizes on universal Clean Water and Sanitation by 2030. This therefore, means that PPPs are vital for this goal to be attainable.

Water, Sanitation, and Hygiene sector, (WASH) requires a substantial investment in infrastructure as to improve access and quality of service in order to meet the SDGs. In this context, Public–Private Partnerships (PPPs) can be regarded as one of the tools among others available to governments for improving the performance and financial sustainability of the Water, Sanitation, and Hygiene sector (WASH). However, the trend toward the development of PPPs have been more successful in developed countries particularly in Europe and United Sates of America, with Africa and the Middle East being the most challenging regions (Martin 2000; Hall 2012).

Hall (2012), posits that PPPs emerged as a result of failure by governments and local authorities to meet capital expenditure, acquire expertise, and handle associated risks that private utilities would manage. In 1987, private firms were engaged by the public sector to build water supply and sanitation facilities using public money and to avoid breaching constraints on government borrowing (Farlam 2005). For over 30 years, the private firms have operated water supply and sanitation facilities in agreement with the government. In 2010 about 2000 water and wastewater facilities were operated in USA under Public–Private Partnerships arrangements, which were cooperation between the private utilities and the local municipalities (Hall 2012). According to the European Commission (2004), European Member States have reached consensus that embracing PPPs paves access to private sector efficiencies, which leads to increased quality and efficiency of public services.

Comparatively the developing world water and sanitation sector is severely under-funded. It is against this background that governments are considering public–private partnerships (PPPs) as a means to improve infrastructure networks in their countries and boost service delivery to their people (Farlam 2005). Hall 2012 observed that between 1991 and 2000, the population administered by private operators in developing and transition countries grew steadily from 6 million to 94 million. In Sub-Saharan Africa, a challenging

region, where almost 300 million people have no access to safe water, there are 38 water and sanitation PPPs, which have reached financial close since 1991 (Berthelemy and Kauffman 2004; Zinyama and Nhema 2015). In African countries, namely, Côte d'Ivoire, Ghana, and Gabon, private companies provide water services to the entire urban population.

Zimbabwe's water and sanitation sector developments are typical of Africa's pace of development, collapsing within a decade (Dube and Chigumira 2011; Zinyama and Nhema 2015). In 1997, Gweru was one of the municipalities in Zimbabwe that engaged the private sector in order to deliver water and sanitation services to its residents in light of a growing population. The 1998 PPP policy and the 2004 PPP policy have been drafted, but have faced various setbacks such as uncertain political environment and prevailing unstable macroeconomic environment (Dube and Chigumira 2011; Chiromo 2014). The Zimbabwe Agenda for Sustainable Socio-Economic Transformation (ZIMASSET), identifies Public–Private Partnerships as one of the financing mechanisms of the water and sanitation sector (Zinyama and Nhema 2015).

Zimbabwe's economic meltdown decade of 2000–2009 virtually paralyzed all socioeconomic sectors including services delivery in urban areas. Economic sanctions imposed on the country, coupled with climate change have exacerbated the urban services delivery nightmare, especially the water delivery system (Matsa and Tapfuma 2015). Sewerage systems have experienced large-scale blockages, water treatment plants are dysfunctional and lack chemicals, and many distribution systems have fallen into disrepair (African Development Bank 2011). In Mvurwi, the infrastructure was planned for a very small community around the late 1960s mainly consisting of the African domestic workers. There was an unforeseen growth of the then Mvurwi Service Centre into a Town Centre leading to a parallel population growth. Upon the proclamation of town status toward end of 2010, Mvurwi town continued to use the same old infrastructure consisting of small old sewer pipes feeding into small dilapidated unlined sewer ponds. Government grants and financial support have not been consistently forthcoming due to economic decline and stagnation over the past decade. The situation is further worsened by defaulting taxpayers, making it difficult for the local authority to improve water delivery and to be able to revamp sanitary facilities that are in a dilapidated state. Therefore, understanding water and sanitation issues affecting Mvurwi will assist toward the attainment of SDG 6, which emphasizes on universal Clean Water and Sanitation.

The Small towns' water and sanitation program (STWP) implemented by UNICEF in partnership with the government of Zimbabwe and other partners since 2009 will help close the gap in the currently underfunded urban WASH sector. By zeroing down on small towns, the program will complement other related initiatives, which have in the past been biased toward medium and large towns. It is in light of this gap that the present study focuses on water and sanitation issues facing Mvurwi town. Therefore, the specific objectives of the study are to: (1) assess the current water and sanitation issues affecting Mvurwi town; (2) evaluate the capacity of authorities responsible for delivering water and sanitation facilities in Mvurwi; and (3) examine the potential role of PPPs in solving water and sanitation issues affecting the small town.

## Literature Review

### The Concept of Public –Private Partnerships

From a narrow legal perspective, public–private partnerships (PPP's) are formal commercial contracts between government institutions and private companies, where the private partner assumes substantial financial, technical, and operational risk in the design, financing, building, and operation of a project in return for specified benefits. There are two legally defined types of PPP, the first being where a private company performs a government function and the second where a private partner is given rights to use state property for commercial purposes, under certain condition

(Farlam 2005; Hall 2012). This study adopts the definition by INWRDAM (2010) where PPPs are partnerships between the public sector and the private sector for the purposes of designing, planning, financing, constructing, and/or operating projects, which would be regarded traditionally as falling within the remit of the public sector. Basically, there are different types of PPP, which can be adopted depending on place and financing (Table 1).

## The Need for PPPs in Zimbabwe Water and Sanitation Sector

The need for funding in the water and sewer reticulation in Zimbabwe became glaring during the 2008–2009 periods, when the advent of a cholera epidemic claimed thousands of lives (Dube and Chigumira 2011). The pandemic was attributed to the poor state of the water and sewer reticulation infrastructure under the control of local authorities, which saw the public resorting to the use of unsafe water sources. Even at times when the major dams, which are the sources of water for domestic use are reasonably full, water supply in urban areas has remained not only erratic but also of a quality leaving a lot to be desired (Chiromo 2014). This has been attributed to a host of problems, which include limited capacity to replace and repair water pumps to source enough chemicals to purify water as well as the inability to replace the dilapidated water supply network, which has seen a significant amount of the little available water being lost through leakages. For example, Harare is

**Public-Private Partnerships on Water and Sanitation Issues in Small Towns: Case of Mvurwi, Zimbabwe, Table 1** The different forms of PPP model and their definitions

| PPP model | Definition |
|---|---|
| Build, operate and transfer (BOT) | A contractual arrangement where the project company undertakes the construction, including financing, of a given infrastructure facility, and the operation and maintenance thereof. The project company operates the facility over a fixed term during which it is allowed to charge facility users (customers) appropriate tariffs, fees, or tolls to enable the company to recover its investment, and operating and maintenance expenses in the project. At the end of the fixed term, the project company transfers the facility to the government agency or local government unit concerned |
| Build and transfer (BT) | A contractual agreement whereby the project company undertakes the financing and construction of a given infrastructure or development facility and upon completion turns it over to the government agency or local government concerned, which shall pay the company on an agreed schedule its total investments expended on the project, plus a reasonable rate of return thereon |
| Build, own, and operate (BOO) | A contractual arrangement whereby a project company is authorized to finance, construct, own, operate, and maintain an infrastructure or development facility from which it is allowed to recover its total investment, operating, and maintenance costs plus a reasonable return thereon by collecting tolls, fees, rentals, or other charges from facility users |
| Build, lease, and transfer (BLT) | A contractual arrangement whereby a project company is authorized to finance and construct an infrastructure or development facility and upon its completion turns it over to the government agency or local government unit concerned on a lease arrangement for a fixed period after which ownership of the facility is automatically transferred to the government agency or local government unit concerned |
| Build, transfer, and operate (BTO) | A contractual arrangement whereby the public sector contracts out the building of an infrastructure facility to a private entity such that the contractor builds the facility on a turn-key basis, assuming cost overrun, delay, and specified performance risks. Once the facility is commissioned satisfactorily, title is transferred to the implementing agency. The private entity, however, operates the facility on behalf of the implementing agency under an agreement |
| Rehabilitate, operate, and transfer (ROP) | A contractual arrangement whereby an existing facility is turned over to the private sector to refurbish, operate, and maintain for a franchise period, at the expiry of which the legal title to the facility is turned over to the government |

Adapted from PPIAF: 2009

estimated to be losing 40% of treated water through leakages (Mutandwa and Zinyama 2015).Thus although increasing the availability of water through construction of more dams, which is also envisaged to be done under PPP, would improve water availability, the prime objective should be to ensure that the current systems allow the efficient use of the water; hence the primary challenge is to improve the water and sewer reticulation. In terms of infrastructure and water purification, PPP can also succeed if heavy industrial water users, such as chemical manufacturing firms, are identified and arrangements are made so that they finance water reticulation in exchange for uninterrupted supplies of water and payment holidays until they have recovered their costs. It was pointed out that companies such as hotels and other tourist resort areas of Victoria Falls, for example, have expressed willingness to pay higher rates for water if that is to ensure that it is reliably available. Thus, for specific arrangements with users, a ROT or BOT model could work (Dube and Chigumira 2011).

## Study Area

Mvurwi town lies about 100 km due north-west of Harare along Harare-Muzarabani/Harare-Guruve Roads within Zimbabwe's Mashonaland Central Province. Mvurwi is the only urban Council within Mazowe District while it is the province's second urban council after the provincial capital, Bindura Municipality. It has an elevation of 1484 m above sea level. The climate is classified as humid subtropical (dry winter, hot summer), with a subtropical dry forest biozone. It is found in agroecological zone 2A receiving an average rainfall of 882 mm per year. In terms of temperatures, there are cyclic variations with maximum temperatures reaching 27.9 °C in October and dropping to 6.2 °C at night (Fig. 1).

**Public-Private Partnerships on Water and Sanitation Issues in Small Towns: Case of Mvurwi, Zimbabwe, Fig. 1** Location of Mvurwi town

P

The town is composed of sandy soils and patches of loam soils. These white sand soils are very hygienic compared to red or clay soils, which are muddy during the rainy season. The landscape is mostly covered with closed to open grassland. These sandy soils promote growth of tall yellow thatching grass (*Hyparrhenia bracteat).* The common tree species in the area are *Brachystegia spiciformis, Brachystegia boehmii,* and *Julbernardia globiflora.* The town is surrounded by large water bodies, which include Pembi, Hyde, and Gulliver dams. It has the Musengezi River, which is a perennial influent into the Gulliver dam.

Mvurwi town has been experiencing rapid population growth. According to Zimbabwe National Statistics Agency (2015), Mvurwi has a total population of 10,492 people with the majority being females. In Mvurwi, the infrastructure was planned for a very small community around the late 1960s mainly consisting of the African domestic workers. There was an unforeseen growth of the then Mvurwi Service Centre into a Town Centre leading to a parallel population growth. Upon the proclamation of town status toward end of 2010, Mvurwi town continued to use the same old infrastructure consisting of small old sewer pipes feeding into small dilapidated unlined sewer ponds. Therefore, there has been a mismatch between population growth and service delivery (sewer pipes, water) as the capacity has been exceeded. Relatively small urban settlements like Mvurwi are numerous in Zimbabwe, yet very rarely studied. Residents hardly have any voice on issues affecting them, with most audience given to the politically important hotspots like larger cities. This therefore motivates this study to assess the water and sanitation issues affecting Mvurwi town so as to proffer suggestions that can contribute to the attainment of SDG 6.

In terms of accessibility and location to other places, Mvurwi is gateway into neighboring Zambia and Mozambique through Kanyemba border post. The town has a trafficable local road network, which includes tarred roads in most sections of the low density, the Central Business District, and industrial areas. Most of the roads within the town's high-density areas comprise of gravel roads, which are periodically repaired. According to the town's Local Environmental Action Plan (L.E.A.P) report of 2015, Mvurwi has one referral hospital, two private surgeries, and a clinic.

Livelihood strategies encompass agriculture where cash crops such as tobacco are grown and mining of minerals such as gold. The town offers job opportunities to its citizens although many residents are self-employed in the informal sector, that is, cross border trading that involves buying and selling of cheap imported goods. Mvurwi has potential to contribute to the growth of the economy as it is a center where much of the cash crop, chiefly tobacco, is sold at Mashonaland Tobacco Company by farmers under A1 and A2 models in resettlement areas such as Holland and Forester estates. This, has however been compromised by the poor economic performance that Zimbabwe has experienced over the past decades. A very small number of property owners within the town hold Title Deeds while a good number have Lease Agreements in respect of their respective allocated residential, commercial, and institutional stands. Poverty levels have reached alarming proportions in Zimbabwe (Zimbabwe National Statistics Agency 2015). The average poverty prevalence level in Mvurwi ranges between 60% and 76%, a situation that will result in poor vulnerable residents failing to meet the tax payments for adequate service delivery in the towns (Zimbabwe National Statistics Agency 2015). In light of the economic malaise that has also gripped Zimbabwe, urban service delivery has been a major concern. This therefore means that there is need for Public–Private Partnerships (PPPs), which assist in designing, planning, financing, and operating projects, which would be regarded traditionally as falling within the responsibility of the public sector a factor that also forms the motivation of this study. This research aims to highlight the potential role that public–private partnerships can play in solving the water and sanitation problems in Zimbabwe's small towns where there is scanty research that has gone in highlighting the water and sanitation problems in small towns as focus was on established cities in Zimbabwe.

## Methods

The study employed a mixed methods approach that used both quantitative (positivist) and qualitative methods (phenomenological or interpretivist). The mixed approach entails the exploitation of varying methodologies to develop analysis with greater detail. Triangulation of qualitative and quantitative paradigms was adopted in order to affirm the validity and reliability of results. Chikova (2011), states that positivism assumes the role of an objective analyst who makes independent interpretations on data that has been collected in a personal opinion free manner. Interpretivism enables probing of data from a human perspective by answering the question how and when. Therefore, in this study the qualitative design depended on open-ended questions, semi-structured interviews, and observations. The quantitative paradigm depended on closed-ended questions.

The target population comprised of Mvurwi town Council Clerk; Mvurwi Town Engineer; households from Suwoguru, Rusununguko, and Pembi View; ActionAid representative, Zimbabwe National Water Authority Superintendent, and WASH community club chairpersons. In this research, a sample size of 10% was employed to represent the whole population (Table 2). A sample size around 10% is applicable to a population exceeding 100 (Mugo 2002). This also took into consideration the issue of time and resources for data collection available to the researchers. Thus, the effective sample size for this study was 144 households, from a total of 1440 households (Table 2).

Field data in Suwoguru, Rusununguko Phase 2, and the Low density (Old Low Density and Pembi View), were collected from 15 August 2018 to 30 September 2019. A total of 144 questionnaires were distributed to the selected household members in Mvurwi town during the survey using the random sampling technique. Since face to face questionnaire administration was adopted, the researchers had to collect all the completed questionnaires on completion of the exercise for analysis. Face to face administration ensured that the data collection instrument reached the target respondent, which improved the quality of results. The questionnaire had a segment that gathered information on the current water and sanitation issues affecting Mvurwi town. The questionnaire also included questions like the following: What are the main sources of water available to residents? What is the quantity of water required by residents per day? What is the role of PPPs in solving water and sanitation issues affecting Mvurwi town? The other segment of the questionnaire probed information on Zimbabwe National Water Authority capacity to provide adequate water in Mvurwi town.

Key participants purposively selected included Mvurwi Town secretary, Finance director, and the Housing and Community services clerk, ZINWA Mvurwi Town superintendent, and WASH community club chairpersons. These groups were targeted because they had vital information pertaining to the contribution of PPPs in addressing water and sanitation issues in Mvurwi town. The outline of the interview guides was constructed in a manner that tests the institutional capacities of the authorities' ability to provide adequate water and sanitary facilities. Semi-structured interviews also probed data on the challenges and opportunities faced in ensuring adoption of PPPs in easing the water and sanitation issues affecting the small town. Field observations were guided by an observation checklist so as to identify the sanitary facilities in the area and the

**Public-Private Partnerships on Water and Sanitation Issues in Small Towns: Case of Mvurwi, Zimbabwe, Table 2** Sample size determination in relation to household size

| Suburb/location | Total households | Ratio percentage | Sample size |
|---|---|---|---|
| Suwoguru | 840 | 61% | 87 |
| Rusununguko Phase 2 | 266 | 19% | 28 |
| Pembi View Park | 338 | 20% | 29 |
| Total | 1440 | 100 | 144 |

water supply infrastructure in the town. Photographs were captured to show the sanitary infrastructure in the town such as manholes. The significance of using field observations as a primary research method is that it goes past individual translation of phenomena, which interviews have a tendency to depend on. Hence field observations give a clear clarification of what truly exists on the ground.

The results gathered from this research were presented in pie charts, bar graphs, and tables using Microsoft excel to draw conclusions, which answer the problem under research. Since the scope of the study extended beyond data presentation, statistical tests were conducted to test the hypothesis. This was essential in determining the nature of association between public–private partnerships and water and sanitation management using chi-square. This involved the cross tabulation of aspects such as the presence of PPPs and water and sanitation management in Mvurwi town. Prior to this research, ethical clearance was sought and granted by the Department of Geography and Environmental Studies. Informed consent enabled the participants to choose whether or not to participate since the results were purely for academic purposes.

## Results and Discussion

### Current Water and Sanitation Issues Affecting Mvurwi Town

In Mvurwi town, water and sanitation issues identified were varied among the respondents. These were attributed to factors such as household size, multi-families on limited facilities, and state of infrastructure in studied locations of Mvurwi, namely, Suwoguru, Rusununguko Phase 2, and Pembi View. Findings indicate that 66% of the respondents are directly affected by water and sanitation issues.

#### Main Source of Drinking Water

From the survey, 52.78% of the respondents received piped water into their dwellings, which is something the town boasts of compared to other towns in Zimbabwe while 32.64% were using boreholes (Fig. 2). According to the WASH community club chairpersons, two-thirds of these boreholes were constructed during the Small Towns Wash Program (STWP). This gesture brought much relief to the acute water shortages that had been experienced in the town as it could not catch up with the ever-increasing population. However, 14.58% were still using protected dug wells as their source of drinking water particularly in Rusununguko Phase 2 (Fig. 2). This was attributed to lack of adequate resources for better service delivery in the town. This explains why the Mvurwi Town secretary pleaded for assistance in form of PPPs to ease the town's service delivery problems. He lamented:

> Regardless of the size and or kind of donation, the town council would appreciate support rendered to them to improve service delivery. Population growth has created pressure on the few available resources which has resulted in incapacitation hence sanitation problems manifest.

#### Quantity of Water Required Per Day

Survey data revealed that 43.06% require 50–80 liters of water per day (Table 3). According to UNICEF/WHO guidelines (2004), the recommended minimum daily water requirement is between 60–80 liters per capita and this implies that in Mvurwi town they have made strides in improving the provision of the required mega liters.

According to the Zimbabwe National Water Authority Superintendent;

> The STWP program capacitated ZINWA in Mvurwi to improve its pumping capacity and refurbishing of old pipes as to curb leakages and in turn improve service delivery.

This points out that although the town is experiencing challenges with water provision, there were commendable efforts form stakeholders such as the aforementioned. Questionnaire survey results also show that about 36.81% use 30–50 liters per day, which falls below the recommended daily requirement by WHO.

### Zimbabwe National Water Authority Capacity to Provide Adequate Water in Mvurwi Town

During the survey, about 43.06% rated the capacity of ZINWA to provide water as poor (Fig. 3).

**Public-Private Partnerships on Water and Sanitation Issues in Small Towns: Case of Mvurwi, Zimbabwe, Fig. 2** Main sources of drinking water. (Source: Field Data)

**Public-Private Partnerships on Water and Sanitation Issues in Small Towns: Case of Mvurwi, Zimbabwe, Table 3** Quantity of water required per day

| Quantity of water in liters | Percentage of respondents (%) |
|---|---|
| 10–30 | 20.14 |
| 30–50 | 43.06 |
| 50–80 | 36.81 |

To support this the residents highlighted that there is an interrupted water supply hindering them to carry out activities such as washing, cooking, drinking, and for toilet flushing. The majority of the respondents (98%) revealed that the major reason for poor performance by local authorities such as ZINWA is attributed to breakdowns and the time taken by the authority to address the complaints. This finding concurs with Mutandwa and Zinyama (2015), who also observed the same situation in Harare, Zimbabwe.

Some respondents (27.78%) rated ZINWA's effectiveness as average (Fig. 3). This group of the target population proved to be aware of the challenges faced by the local authority. They highlighted that the authority water supply has slightly improved as there is now improved access to water after refurbishment of old rusted pipes in Suwoguru. A section of the respondents, which constituted 16.67%, pointed out that water provision by ZINWA was good, as they received an uninterrupted water supply. Some respondents (12.5%) mentioned that water provision by ZINWA has drastically improved since engaging GEC private company during the STWP program, hence clean, adequate, and continuous water supply by ZINWA is now guaranteed.

## Provision of Adequate Sanitation Facilities by Mvurwi Town Council

Mvurwi Town Council ability and capacity to offer adequate sanitary facilities was another major issue that required attention during the survey. The results in Fig. 4 show that service provision by MTC has fairly improved. About 44% of

**Public-Private Partnerships on Water and Sanitation Issues in Small Towns: Case of Mvurwi, Zimbabwe, Fig. 3** ZINWA's capacity to provide adequate water in Mvurwi town. (Source: Field Data)

**Public-Private Partnerships on Water and Sanitation Issues in Small Towns: Case of Mvurwi, Zimbabwe, Fig. 4** Rating of MTC in terms of sanitary facilities provision. (Source: Field Data)

the respondents pointed out that, sanitary facilities had increased since inception of the WASH program. Mvurwi town council was rated average in terms of service delivery, which clearly points out that there is need for improvement. Furthermore, some residents in Mvurwi town constituting 28% consider council's service delivery poor, especially in terms of sewer outburst they were still experiencing despite some attempted improvements. This finding concurs with Chiromo

(2014), who observed that often town councils lack the capacity to provide sanitation facilities due to tiny operational budgets.

### Challenges Faced in the Implementation of PPPs in Mvurwi Town

Implementation of PPPs in Mvurwi town faces some limitations as observed during the household survey. The legal environment in Zimbabwe impedes the successful implementation of PPPs (Mutandwa and Zinyama 2015). Chiromo (2014) indicates that the macroenvironment in Zimbabwe is not conducive for private companies to fully engage the public in effective PPP arrangements.

Mvurwi Town Council Clerk indicated that the Council lacks technical expertise to deal with sanitation issues affecting the town. The skilled labor is unavailable to deal with issues of sewer treatment. The town clerk indicated that as an organization they regard PPPs to be instrumental in playing an assisting role in service delivery. Town council, as an organization, has implemented Local Donor Conferencing. Local Donor Conferencing was an arrangement where the town council engages local business owners in Mvurwi to assist in service delivery and in return the private organization is exempted from taxes equivalent to the services rendered to the town council. The legal procedures followed were guided by the signing of a Memorandum of Understanding (MoU) between the parties.

The town finance director indicated that the Council lacks enough funding to deal with the sanitary facilities in the town. Community members reiterated that PPPs are the route to take in easing water and sanitation issues. Over 90% of the population in Mvurwi relies on vending hence they are failing to pay for the services provided by Zinwa and Mvurwi Town Council. Failure to pay council and ZINWA incapacitates the authorities to carry out their mandate of providing high standards of service. ZINWA Superintendent emphasized that they shared the same sentiment with the town council since they do not have adequate financial resources to offer adequate water resources to the town.

### Role of PPPs in Solving Water and Sanitation Issues Affecting Mvurwi Town

Mvurwi town regards PPPs as an effective means to solve water and sanitation issues affecting the town. The WASH program engaged GEC and Ten craft under a Non-Governmental Organization called Action Aid to rehabilitate water and sewer infrastructure in the town (Table 4).

The majority of the respondents (53%) indicated that PPPs would assist in the rehabilitation of water and sewer infrastructure that has been compromised by population pressure. The Town Secretary highlighted that:

> Most of the infrastructural developments had become obsolete since they were constructed about four decades ago, when the areas had not yet fully developed. There has since been a mismatch as population growth has far exceeded the capacity of the old dilapidated infrastructure. This has resulted in small old sewer pipes feeding into small dilapidated unlined sewer ponds; hence bursts are frequency thus exposing the residents to health challenges.

About 15% of the respondents indicated that improved water use would be attained as a result of the PPPs. They welcomed Public–Private Programs as an initiative that would ease their water and sanitation woes, as it improves access to water and sanitation infrastructure and some may be employed in the process, which would help to sustain their livelihoods. Mvurwi Town was facing challenges in offering adequate sanitary facilities to the town. About 12% of the respondents highlighted that significant improvements were attained in waste water management as new

**Public-Private Partnerships on Water and Sanitation Issues in Small Towns: Case of Mvurwi, Zimbabwe, Table 4** Role of PPPs in solving water and sanitation issues affecting the small town

| Opportunities associated with implementation of PPPs | Percentage of respondents (%) |
|---|---|
| Rehabilitation of water and sewer infrastructure in the town | 53 |
| Adequate sanitary facilities to the town | 20 |
| Improved water use | 15 |
| Improved waste water management | 12 |

manholes were provided. Access to water has also improved as some areas are receiving uninterrupted supply of clean water. Figure 5 illustrates a manhole constructed by Ten craft to ease water service provision.

### Responsibility for Solving Water and Sanitation Issues

Most of the residents in Mvurwi town (50%) indicated that PPPs should be adopted to solve water and sanitation issues affecting the town. ZINWA and the Town council were identified to be not fully capacitated to offer high standards of services in the town (Fig. 6) This was evidenced by 20% of the questionnaire respondents. However, the partnering of the Government and Non-Governmental organizations can be successful in resolving water and sanitation as shown by 30% of the respondents. Respondents highlighted that since they have been experiencing acute water shortages in the town PPPs would present an untapped opportunity toward the challenges they have been experiencing.

Those who mentioned ZINWA and the Town council indicated that the two authorities are not fully capacitated to offer high standards of service delivery in the town. Therefore, a large proportion indicated that PPPs are capacitated to solve water and sanitation issues affecting the town. Chi square test results ($p = 0.02$) show that there is an association between PPPs and water and sanitation management. This means that where PPPs arrangements are in place there are better chances of improved service delivery due to pooling together of resources as compared to inadequately resourced institutions and/or collaborations. Therefore, PPPs should be spread across in small towns in Zimbabwe such as Mvurwi and should not be limited to large cities.

**Public-Private Partnerships on Water and Sanitation Issues in Small Towns: Case of Mvurwi, Zimbabwe, Fig. 5** New manholes constructed by Ten craft. (Source: Field Data)

## Conclusion and Recommendations

The study examined the role of public–private partnerships in solving water and sanitation issues affecting Mvurwi town. The research findings show that PPPs are an effective means to solve water and sanitation issues affecting the town. Local people and various stakeholders such as ZINWA and community health clubs noted that PPPs are the route to take in offering adequate water and sanitation facilities in the town. However, the study emphasizes that the capacity of PPPs to bring plausible results is compromised by a number of challenges. These include lack of financial resources and skills sharing in providing adequate water and sanitary facilities. Residents were directly affected by the state of affairs in terms of water provision and sanitation issues with women being mostly affected. This therefore complicated the potential of PPPs to contribute toward the attainment of SDG 6 as set under the obligations of the United Nations Agenda for Sustainable Development. A huge proportion of the residents faced challenges in paying their bills

**Public-Private Partnerships on Water and Sanitation Issues in Small Towns: Case of Mvurwi, Zimbabwe, Fig. 6** Responsibility for Solving Water and Sanitation Issues

to the local authority to ensure continuity of service delivery. They welcomed Public–Private Programs as an initiative that would ease their water and sanitation woes, as it improves access to water and sanitation infrastructure and some may be employed in the process, which would help to sustain their livelihoods. Mvurwi Town was facing challenges in offering adequate sanitary facilities to the town. The research findings indicate that funding from government has not been forthcoming in assisting the Council to develop and rehabilitate sanitary facilities in the town. The general populace was failing to pay for the services rendered to them. This scenario has undermined the Council's institutional capacity to carry out its mandate of offering adequate sanitary facilities to its residents. Therefore, there is need for more fiscal support from the Government targeting the local town council so that they carry out their mandates in service delivery smoothly.

The study also emphasizes that Mvurwi Town Council should strive to legalize its engagement with the private sector particularly local business operators in Mvurwi. They should go a step further beyond the signing of Memorandum of Understanding as to ensure transparency in operations and sharing resources and benefits between them and the public sector. In case of PPP arrangement, the residents in Mvurwi town should be cooperative in paying their bills for services rendered to them. This makes the local authorities (ZINWA and Mvurwi town council) capacitated to offer standardized services to them. The government should create a conducive legal environment that capacitate institutional framework of ZINWA and Mvurwi Town Council needed for effective implementation of PPPs. In addition to this, the Town Council can also fund research projects targeting the role of PPPs and their successful implementation so that lessons can also be drawn, which can also be qualified to other urban areas in the continent and world at large.

Joint ventures; Public-private partnership

## Definition

| | |
|---|---|
| Privatization | The act of transferring ownership of specified property or business operations from a government organization to a privately owned entity. |
| Readiness | The state of being fully prepared to engage in privatization and strategic partnerships |
| Strategic partnership | A relationship between two entities based on a long-term agreement for the mutual sharing of resources to achieve defined common objectives |
| Sustainability | The ability of both the public sector to maintain its relationship with the public sector and vice versa |

## Introduction

The foundation of the economic dynamics in the United Arab Emirates (UAE) is based on oil production and its vast oil resources. As a matter of its long strategic plan and economic sustainability, the UAE had adopted a policy that is shifting the focus away from its dependency on oil to one of a diversified economy. In effect, the different

emirates, as well as the federal governments, had set goals that are finely tuned to the realization of the goals of economic diversification (Seznec 2011). The pursuit of economic diversification and commitment to innovation are central to the UAE policy of fulfilling the core values of domestic and international trade.

As a corollary, the leaders of the UAE saw the need for organizations to improve quality and customer service to become competitive. In effect, a number of strategic and far-reaching macro-level quality and excellence initiatives were launched for all sectors of the economy, namely, the government departments and the public and private sectors. At this point in time, Dubai was the first mover and key driver of quality excellence in the UAE, and organizations started adopting best practices, international standards on quality, and business excellence frameworks and investing in people development. Abu Dhabi and the other emirates later followed and created their own programs improving efficiency, effectiveness, customer service, and overall competitiveness of industry and nation. For Abu Dhabi specifically, the Sheikh Khalifa Excellence Award (SKEA) and Abu Dhabi Award for Excellence in Government Performance were established. The SKEA was established in 2001 by the Abu Dhabi Chamber for the private and public sector. SKEA uses a framework similar to EFQM. The Award for Excellence in Government Performance was established in 2008 for Abu Dhabi government entities/departments (Thawani 2014).

The ASQ (American Standard for Quality) noted that the quality journey of the UAE opened a number of opportunities for improvement in quality management such as creating a culture of sharing data/benchmarks; the use of advanced quality tool; measuring the impact and benefit of TQM on corporate performance; exploiting synergies in quality, risk, corporate social responsibility, and corporate governance; and quality in design.

Abu Dhabi Vision 2030 embodies the foregoing initiatives to transform the emirate into a world-class economy by diversifying into various sectors, integrating with the global economy, optimizing government resources, and investing in social and physical infrastructure. Accordingly, the government of Abu Dhabi had identified nine areas defining the social, economic, and political future of the emirate: large, empowered private sector; knowledge-based economy; transparent and optimal regulatory environment; premium healthcare, education, and infrastructure assets; optimization of resources; complete domestic and international security; continuation of strong and diverse international relations; maintenance of traditions, heritage, and cultural assets; and strong contribution to the Federation of UAE (ADCED 2008). Empowering the private sector included the provision regarding the partnership with the government which ranged from large-scale privatization and PPPs to smaller-scale strategic partnerships.

Privatization was also adopted as an economic strategy by the Abu Dhabi government. Strategic alliances with foreign companies and governments will allow the expansion of the public sector services to develop the social welfare provisions. Some of the most important privatization partnerships the Abu Dhabi government is undertaking include business ventures into healthcare, education, utilities, and alternative energies. The UAE government also believes that privatization can improve the country's chances of future sustainable development by allowing for leadership positions in alternative energy research sectors that will eventually replace oil as global power providers (Government of Abu Dhabi 2008). Likewise, privatization will help the UAE small and medium enterprises (SMEs) develop their job skills training and expertise to specialize in various services and production that will open up the economy for more capitalist ventures in the future. This will provide more jobs in the private sector for Emiratis who are mainly employed in the public sector due to their need for job skills and work experience (Al Hashimi 2005). In this regard, the experiences relative to large-scale privatization, public-private partnerships, and strategic partnerships connoted in Abu Dhabi 2030 were looked into in terms of readiness and sustainability as mediated by quality the initiatives are undertaken.

The economic priorities of Abu Dhabi Vision 2030 include achieving economic development and sharing of economic benefits to every section of the society. In this regard, one of the four key priority agenda of Abu Dhabi Economic Vision 2030 is the optimization of government operations. The policy agenda set out guidelines for optimizing the government's own role in the future of the Emirate, by improving the efficiency and accountability of government departments. The government has already embarked on an extensive review of its processes and structures. Many services are being delivered electronically through e-government initiatives, and departments are being streamlined and noncore services outsourced to the private sector. These initiatives will be continued and enhanced. At the same time, the government continues to review and enhance the legislative framework and the law-making processes themselves to ensure maximum efficiency (ADCED 2008).

## Readiness to Engage in Strategic Partnerships

In the UAE, total quality management (TQM) highly contributed to enhancing the readiness of organizations to participate in strategic partnerships. Practitioners from the services sector affirmed the effectiveness of applied TQM and quality assurance in ensuring their readiness to contribute to the government initiative in upgrading the quality of schools and hospitals and the utilities system in providing world-class services to the communities of Abu Dhabi. Similarly, the manufacturing sector demonstrated that applied TQM was instrumental in preparing their organizations for the strategic partnership with the government by strengthening the general aspects of the management system and their functional areas of specializations.

For SMEs, their focus was more on business planning as this was a core requirement for partnership. Hence quality tools and quality practices in relation to enhancing their readiness appeared not to have resonated with these organizations.

There appeared to be a convergence among the government sectors on the significance of quality practices in preparing their entities to partner with the private sector. There was a consensus of views that quality practices ensured the integrity of their management systems which they need to keep strong as more partnerships are forged with the local private sector. The government sector adhered to global quality standards to keep up with the various developments in the field of their partners. More so, the performance of their organizations was monitored and that they needed to apply quality principles in order to be competitive. The government sector kept up with the indicators set by government affirming that applied TQM was not only necessary and essential in their performance but also a vital component in the selection of private partners and in sustaining their partnership with the private sector.

## Sustainability of Strategic Partnerships

Applied TQM contributed very much in sustaining strategic partnerships between the government and private sectors. Both sectors used a menu of tools that were consistent with the nature of their businesses or services which also implied the application of principles and practices of TQM. Foremost among these principles was customer satisfaction, employee involvement, leadership, training of the personnel, and continuous improvement. For the smaller companies that did not focus on quality certifications prior to entering into partnerships with the government sector, they have caught up with the practice as this was not only a means by which they continuously improved and enhanced organizational health but was also a means of keeping up with the high standards set by their government partners.

On the whole, applied TQM was not only an essential requirement in preparing organizations for partnership with the government sector but was also a vital factor that sustained for their partnership. The experiences of various companies led to the development of a framework that highlights the potential significance of applied

TQM in preparing private organizations for strategic partnerships with the government. The framework hypothetically covers the significant touch points identified by the companies and identifies the key considerations for the application of TQM. Each of the touch points has its own detailed processes which were organization-specific. Based on the framework:

1. The government agency develops project proposals for potential partnership with the private sector and calls for proposals by way of public invitation.
2. The private sector companies with significant partnership ideas develop the corresponding project feasibility studies and submit these to the hosting government agency.
3. The proposals are thoroughly evaluated and screened using the appropriate criteria after which approved proposals are selected. This is followed by the announcement of the qualifying companies.
4. The bidding, tendering, and prequalification process follows which selects the best company for partnership. A contract between this company and the government is later entered into which becomes the foundation of the partnership.
5. The private company implements the project.
6. The performance and outcomes are duly evaluated by the government partner.

All of the processes are presumed to be within the ambit of a robust and enabling legal framework (Fig. 1).

Within the processes described, there are certain key considerations where applied TQM can significantly contribute to:

- Quality certifications of the private sector companies can support their credibility in quality assurance and in providing service quality.
- The balanced scorecard can be useful in planning for potential projects on the part of the government and in the preparation of feasibility studies on the part of the private sector.
- Benchmarking is an essential consideration in ensuring that private companies bring in the global best practices in the industry.

**Public-Private Sector Readiness and Sustainability of Privatization and Strategic Partnership, Fig. 1** Framework for applied TQM in strategic partnerships between the public and private sectors

- Business process management helps ensure administrative efficiency on the part of the government and sustains making an organization's workflow more effective, more efficient, and more capable of adapting to an ever-changing environment.
- Customer complaints management framework ensures that there are optimum customer services and stakeholder satisfaction based on project implementation and outcomes.
- Customer loyalty/satisfaction measurement ensures that the views of end users are factored into the operation of the project.
- Employee loyalty/engagement measurement ensures the commitment of employees to the project and high morale which that boost their performance.
- Enterprise risk management ensures that risk is properly managed in order to promote project sustainability.
- Kaizen is a philosophy of continuous improvement which should be embraced in the implementation of every project.
- Lean Six Sigma ensures that variances are identified and minimized in order to control the quality of products and services.
- Performance management dashboard ensures easy access to information that is essential in determining performance levels, as well as in planning and decision-making.
- The application of quality principles would also significantly contribute to the sustainability of partnerships.
- Leadership commitment is a necessity in all of the aspects of partnership from the beginning to the end to ensure support and success of the projects.
- Communication is the binding element vital to the partnership. An integrated communication system using the state-of-the art IT technology ensures transparency, the smooth flow of information, information security, and access to vital information critical to planning and decision-making.
- Quality planning should be the central consideration in planning project proposals and feasibility studies as well as in preparing operational plans for project execution.
- Customer satisfaction should be one of the central rationales for the partnership of the government with the private sector.
- Continuous improvement is the key consideration for administrative efficiency, project sustainability, and organizational health of the projects.
- Employee engagement and satisfaction should be a central consideration to boost employee performance that contributes to organizational efficiency and effectiveness.
- Quality culture defines the norms and way of life in the company that reflects embracing quality principles by all levels of the organization.
- Teamwork breaks down barriers in project planning and implementation that promoted optimum involvement, engagement, and commitment.
- Training promotes knowledge and technology transfer that contributes to the attainment of the goals of Emiratization and the development of local talents.
- Rewards and recognition promote ownership and acknowledge best performance and practices which can significantly boost the morale of the workforce.

The effectiveness of applied TQM can be discriminated on the basis of whether these were used to enhance readiness or to promote sustainability. Hence the effectiveness of TQM principles and practices is dependent on its utility.

## Conclusions and Recommendations

Applied TQM works and its influence in enhancing the readiness of the public and private sectors to enter into partnerships cannot be discounted. As a corollary, applied TQM is essential in promoting the sustainability of partnerships between the public and private sectors. By way of implication, the UAE government can attain greater sustainability through privatization and other strategic partnerships as part of its economic diversification strategy as it continues to improve its quality practices. With the UAE government's

experience with the global recession and financial crisis, leaders were compelled to develop new strategies for future sustainable development of the UAE economy which saw the importance of applied TQM in pursuing these strategies.

The following are recommended to leverage the widespread practice of TQM by the government and private sectors in enhancing their readiness for privatization, private-public partnerships, and strategic alliances:

1. There is a need for the enactment of a law that will shape the development of a robust legal framework governing privatization and other public-private partnerships in Abu Dhabi.
2. A central committee for privatization needs to be established as part of the government structure in Abu Dhabi that will be responsible for setting the standards for privatization and other strategic partnerships.
3. A framework for privatization and other strategic partnerships needs to be developed that is backstopped by general guidelines, procedures, and requirements contained in a manual in order that potential investors can be properly informed.
4. The government needs to set up a robust and integrated IT system needed to support privatization and other strategic partnerships.
5. This government needs to pursue collaboration of the strategic alliances formed between the universities, the multinational corporations, the UAE Ministry of Education, and the UAE government for Emiratization to be successful in the long term. The collaboration can help create a continuous global network of knowledge exchange and technology transfer.
6. The government needs to ensure that privatization and other strategic partnerships bring in change management strategies which will help streamline the workplace and upgrade productivity in all divisions of UAE government.
7. There is a need to document best practices by establishing a global network of permanent archival data that can be used for accounting, filing, memos, feedback, and employee records and as an online communications center for all employees. This will also promote the coordination of all departments to be linked through databases to upgrade overall communication and efficiency.

On the whole, the Abu Dhabi government should continue implementing privatization and other strategic partnerships because it will allow for more competition and better service provision within the public sector for necessities like water, electricity, healthcare, banking, education, and telecommunications. Some of the practical recommendations for privatization and sustainable development that the Abu Dhabi government can implement include:

1. Diversify the public sector by adding as many global partnerships as possible.
2. Reduce the overall financial burden on the government by expanding the capabilities of the public sector with global alliances.
3. Upgrade the political relationships between the Western world and Arab world by establishing Abu Dhabi as a major business hub.
4. Develop a global reputation as an easy-to-do business location that will attract international investors and FDI and foreign partnerships to the public and private sectors.
5. Establish Abu Dhabi as a center for major innovation and new technology research and development hub.
6. Continue to launch new sustainable development strategies and educational awareness programs throughout the UAE to upgrade the society's knowledge about sustainability.
7. Integrate appropriate change management strategies into the government public sector during privatization development to increase adaptation to change for all employees.
8. Launch new talent management and continuous learning training programs to enforce Emiratization throughout the public and private sectors.
9. Integrate global corporate training programs with Abu Dhabi programs to ensure Emiratis are properly trained, qualified, and skilled for privatization partnership business ventures to ensure future job security.

10. Focus on the development of leadership in the government manager role.
11. Integrate government manager leadership into the innovation process.
12. Recognize the significance of privatization in government management.
13. Coordinate privatization strategies to allow government managers to streamline overhead costs and upgrade the daily routine throughout the entire organization.
14. Ensure privatization implementation will upgrade the flow of information and communications throughout the value-added global privatization.
15. Develop the organizational culture by improving the overall sharing of information and communication throughout the organization.
16. Encourage the generation of innovative ideas by all employees through continuous learning programs to adapt to efficient methods and processes.
17. Adopt successful innovation methods from multinational corporations.
18. Adopt new governmental regulations to adapt to the global workplace environment.
19. Upgrade government policies to include employee continuous learning and training programs.

# Puerto Rico's Default on Municipal and Commonwealth Debt: Implications to Financial Management and Policy

Clifford Blumberg
Department of Public Affairs, College of Architecture, Planning and Public Affairs, University of Texas at Arlington, Arlington, TX, USA

## Synonyms

Financial crisis; Financial obligation; Local government budget crisis; Local government finance; Municipal debt; Municipal finance; Public dept crisis

## Introduction

The municipal bond crisis currently unfolding in Puerto Rico can be seen as an outcome of nearly a century of economic policy manipulation by the United States. Many of the issues Puerto Rico faces are inflicted through the core nature and structure of their island's Commonwealth status. US policymakers have used this designation to influence and dictate economic policy to the island, rather than by the citizens or its elected officials. Although Puerto Rico closely resembles a US state in the judicial sense, it does not resemble one in the eyes of modern investors. Investors have focused on the 1917 Jones Act and later the implementation of Section 936 in the US Tax Code in 1976. Together, these actions exempted all Puerto Rico bonds from federal, state, and local taxes, regardless of where the bondholder resided. Following decades of foreign investment, Puerto Rico is experiencing historic divestment in both people and resources. In order to fully understand the complexity of the dramatically worsening economic and social conditions in Puerto Rico, focus should be paid to the island's financial and budgetary governance models and how these models interact with the modern bond market.

## Destiny, Protection, and Expansion

The United States began acquiring Caribbean territories during the late 1800s largely motivated by two factors, Manifest Destiny (the United States had a moral claim to any territory within reach) and the 1823 Monroe Doctrine (European nations should not concern themselves with Western Hemisphere activities). Control of economic resources such as tobacco and sugar also fueled some policymakers' ambitions for Caribbean territories during the antebellum era (May 1991). Following the Civil War, many large American businesses sought new markets, and by the 1880s, the US government was looking to influence regions beyond North America. During the 1896 and 1900 presidential elections, William McKinley featured territorial expansion as a key platform issue. McKinley specifically wanted to focus on southward expansion toward a still under construction, American-owned canal connecting the Pacific and Atlantic oceans.

As a part of an American strategy to capture Spanish holdings in the Caribbean, the United States invaded Puerto Rico on July 25, 1898. With light resistance from the Spanish Army, hostilities ended weeks later on August 12, 1898. Less than 4 months after invasion, on October 18, 1898, the United States installed a military government, and within 6 months, Spain ceded the Philippines, Guam, and Puerto Rico to the United States with the signing of the Treaty of Paris on December 10, 1898. The United States' victory in the Spanish–American War pushed Puerto Rico further away from self-rule. Whereas Spain promised political autonomy for the island, the United States installed 2 years of military rule under three presidentially appointed governors.

## The Foraker Act of 1900

The first law to define Puerto Rico's territorial status initially began as a bill intended to apply US customs and internal revenue laws on the island. The Senate bill introduced by Joseph Foraker of Ohio also included a temporary civil government for Puerto Rico. The bill recommended the election of a delegate to the US House of Representatives, who shall be allowed a seat but not a vote in that body. President McKinley signed the Foraker Act on April 12, 1900. The law designated the island as an unorganized territory and established a colonial regime administered by the US president and the Congress. Puerto Ricans were not granted citizenship, but rather, those that swore loyalty to the United States would receive its protection. The law also allowed the US president to appoint the island's governor and an 11-member executive council who directed the six principal administrative bureaus. In addition, the law created a 35-member popularly elected house of delegates but the presidentially appointed 11-member executive council had unchecked veto power over any outcome.

As questions about American citizenship for Puerto Ricans were raised, the US Supreme Court delineated entitlements between incorporated and nonincorporated territories. Nonincorporated territories would receive fundamental constitutional protections including freedom of expression, due process of law, equal protection under the law, and protection against illegal searches, but not the full range of protections afforded to US citizens. The court was strongly divided over the 5–4 decision in Downes v. Bidwell. Five different opinions were written reflecting the variety of views and with the island territory neither fully part of the United States nor an independent country, the decision which was intended to clarify, ended up reinforcing Congress's absolute authority.

## The Jones Act of 1917

Following the rejection of large parts of its legislative agenda by the presidentially appointed executive council in 1909, the Puerto Rican House of Delegates submitted petitions to the US Congress and President Taft protesting the Foraker Act. The delegate threatened to use what little power they held and adjourn without passing vital budget and appropriation bills. Congress reacted to the threats by amending the Foraker

Act to enable Congress to pass the budget bills if the House of Delegates failed to act.

During the campaign of 1912, Woodrow Wilson included a promise to ensure US citizenship and home rule for Puerto Ricans, and between 1912 and 1914, bills were introduced on six occasions but never gained support in Congress. In 1914, US officials began to find great strategic value in Puerto Rico's location. With the completion of the Panama Canal and the start of World War I, US officials feared the Caribbean region would be a battleground.

When the Jones Act was introduced, much of the colonial structure remained in place. The new legislation would increase the territorial house from 35 representatives to 39; it also created a new popularly elected 19-member senate. However, it reserved the US Congress' right to amend or annul bills. The bill also stated that directors of four of the six major government departments would be appointed by the US president but with the advice and consent of the territorial senate. Still, the president would appoint the other two directors without advice and consent of the territorial senate.

Also within the Jones Act were strict economic and trade requirements. The law included requirements that were focused on directly benefitting the U.S. manufacturing and shipping industries. One of these requirements is still in place nearly one hundred years later and continues to constrain the Puerto Rican economy. A mandate that requires all goods purchased on the island arrive via American made ships staffed by American crews.

## Puerto Rican Municipal Bonds

The Jones Act also benefited the investment and banking industry. Specifically, all bonds issued by the US government would be tax exempt at all levels of government. For nearly 100 years, this "triple tax exempt" status has been both costly to the island as well as attractive to investors.

This is in contrast to other typical municipal bonds that are issued by states and municipalities with interest payments exempt from federal tax but generally not exempt from state and local income taxation unless bondholders reside within the municipality.

Municipal bonds can be split into two categories, general obligation and revenue bonds. General obligation bonds are backed by the full faith and credit of the issuer and are a first lien on taxes raised. Revenue bonds are backed by the income generated from the project for which the funds were raised, such as electricity sale revenues from an electric utility. Municipal debt is rated by one or more of the three major rating agencies with Aaa to Baa3 "for investment grade" for Moody's and AAA to BBB- for "investment grade" for Standard & Poors' and Fitch.

In addition to the distinct tax advantage for holders of Puerto Rican municipal bonds, the Puerto Rican Constitution (Article VI, Section 8) already mandated interest and amortization on public debts be given first priority. For investors, this is an attractive but a high-risk gamble because if the interest payments on debt are constitutionally protected, the likelihood of sovereign default increases during a time of limited economic resources. These required interest payments might crowd out investment in infrastructure and general development, thus decreasing the likelihood of Puerto Rico achieving economic growth. This condition has helped fuel the island's death spiral of falling revenues and increasing debt burdens.

## Section 936

The Puerto Rico economy has also been adversely affected by a number of changes in US tax policy; one of the most significant was the expiration of Section 936. Section 936 was a tax incentive for US companies to manufacture in Puerto Rico. The law allowed for repatriation of corporate profits to the US mainland without paying federal tax. In an attempt to simplify the tax code, President Clinton repealed Section 936 in 1996 with a 10-year phase-out plan.

The pharmaceutical industry was the largest beneficiary of this tax break and as such was also a major driver of employment on the island. In fact, in 2002, the sector was responsible for

56% of total manufacturing jobs and 20% of total industrial jobs on the island. Although the pharmaceutical industry was able to largely maintain its tax advantages as an existing industry on the island, the expiration of the exemption was a significant disincentive for new industries to move to Puerto Rico. In 2006, Section 936 fully expired and helped to thrust the island economy into its long recession.

## Falling Revenues, Increased Debt Burden, and Poverty

In 2012, the island's poverty rate was 44.9% with 38% of the population receiving food stamps; US rates were 15.9% and 13.6%, respectively. Puerto Rico's real GDP per capita was $21,143, which placed it below Mississippi ($28,944), the poorest US state. In comparison, real GDP per capita of the mainland United States was $42,784.

When faulty forecasting and budgeting drive economic policy, we often find annual deficits. Therefore it is no surprise that the Commonwealth has not balanced its budget in 16 years. This is the point at which repercussions of poor public policy meets the bond market. Unlike healthy municipalities, the Commonwealth relies on issuing debt to meet payroll and other operational obligations. The Commonwealth also has to finance its annual deficits, and this has caused the island's debt-to-GDP ratio to rise continually and rapidly. In fiscal years 2011 and 2012, Puerto Rico's debt load grew while the economy contracted, and the island's debt-to-GDP has currently risen above 100%, compared to 57% in 2001.

## Public Budgeting in Puerto Rico

Puerto Rico is unique in its extensive use of public corporations to deliver public services. It directly and indirectly manages 48 public benefit corporations. The island's most important public corporation is the Government Development Bank (GDB). The GDB is the fiscal agent, paying agent, financial advisor, and primary lender to the Commonwealth, its political subdivisions, and its public corporations. However, this wide-reaching, powerful public corporation is weakly monitored and is unregulated by the Federal Reserve or Federal Deposit Insurance Corporation. Instead, the Commissioner of Financial Institutions of Puerto Rico performs audit examinations of the bank every 18 months. This governance structure has limited transparency and fiscal accountability within the public sector.

The GDB has become increasingly overstressed financially and highly politicized. Roughly 35% of the GDB's assets are comprised of loans to the Commonwealth and its public entities, and most of these loans are paid late. The GDB has attempted to enter into fiscal oversight agreements with several of the island's large public corporations (Highways and Transportation Authority, the Puerto Rico Aqueduct and Sewer Authority (PRASA), the Electric Power Authority, the Ports Authority, the Puerto Rico Medical Services Administration, the Puerto Rico Health Insurance Administration, and the University of Puerto Rico). These agreements require the public corporations to implement expense reductions and rate hikes or submit to increased oversight to ensure the GDB is repaid. The bank's intervention into areas traditionally reserved for policymakers increases politicization and has already led to opaque intergovernmental borrowing.

Intergovernmental capital flows represent a significant portion of the island's financial activities, and they have had an impact on the island's larger issuers. For example, in 2012, almost 28% of Puerto Rico Electric Power Authority's unpaid bills were owed by delinquent public sector organizations. Puerto Rico consistently adopts aggressive economic and financial forecasts. The GDB has missed economic growth forecasts for 5 consecutive years. This means there is little potential to free up cash by extending maturities through refinancing. And, because it borrows frequently to fund operations, the Commonwealth must retain market access to avoid a bond default. But, Puerto Rico's bond ratings of Baa1/BBB are barely investment grade. Any further downgrade could force some selling of bonds and significantly limit future demand. This scenario is unlikely insofar as

rating agencies generally give struggling issuers time to implement planned reforms, but Puerto Rico's reforms have stalled.

## Conclusion

The paternal relationship between the US Congress and the Puerto Rican government led to the current crisis facing the island. Evolving from military to political to economic control, the United States has manipulated public policy in Puerto Rico for nearly 100 years. One of the sticking points in the rescue legislation has been how to handle the highest-priority debt. The Treasury Department has argued that Puerto Rico's restructuring will not be successful if all debts are not on the table. But some lawmakers are concerned about overriding Puerto Rico's Constitution or setting a precedent that deeply indebted states might 1 day try to follow.

However, as mentioned above, many of the lawmakers are coming from states that are large buyers of Puerto Rico bonds, and when interest rates begin to rise, these funds may enter a prolonged period of redemptions, and their capacity to keep buying Puerto Rico bonds may disappear. If those redemptions coincide with further deterioration in Puerto Rico's credit quality, mutual funds could become sellers rather than buyers.

Some members of Congress believe the latest default (May 1, 2016) showed urgent need in establishing federal oversight and restructuring powers for all of Puerto Rico. However, Congress is up against the clock, as Treasury Secretary Jacob J. Lew voiced a call to act swiftly, "this is not just a matter of financial liabilities and litigation," that without a legal framework for a debt restructuring, Puerto Rico is in danger of getting caught in "a series of cascading defaults" that could lead to a taxpayer bailout (Walsh 2016, B3).

# Purchase Card Programs

Mahendra Gupta and Richard Palmer
Olin School of Business, Washington University in St. Louis, St. Louis, MO, USA

## Synonyms

Acquisition cards; p-cards; Procurement cards; Purchasing cards; Virtual cards

## Definition

The purchase (or Purchasing) cards is a bank-provided commercial card technology product designed to increase the efficiency of the low-dollar procure-to-pay process by enabling employee-cardholders to charge purchases, which the organization agrees to pay in full each billing cycle. Cardholders are assigned a monthly credit limit and typically provided with a plastic card. Unlike personal credit cards, the government agency is obligated to pay *one* bill that summarizes monthly purchases made by *all* agency cardholders.

A derivative of the purchase card is the "virtual card." Virtual cards (also known as electronic accounts payable) are nonplastic card accounts

used to pay for goods and services after an invoice has been received. The essence of the virtual card is a dynamically-adjustable account, meaning the available credit on the account is adjusted to match a specific transaction to be charged to the card number. Hence, after the transaction is completed, the available line of credit on the card is of little or no value. Virtual cards have a "push" and "pull" model. The "pull" model is so named because suppliers are required to input transaction data in order to pull the transaction through to its conclusion. Within the pull model, there are three major variations, differing on whether or not the card number is constant or if the card number (and its associated credit line) is created specifically for a single transaction and then retired (e.g., a "single-use" account). Within the variations in which the card number is constant, a further distinction can be made regarding the identity of the party (buyer or seller) that maintains possession of the card number. The "push" model of virtual card use is referred to as "straight-through" or "buyer-initiated" payments (BIP), which entails a card account that the buying organization charges on behalf of the vendor, resulting in funds being deposited (pushed) directly into the vendor's bank account. Given the additional level of control over payment, the virtual card is often associated with transactions of higher dollar amounts than reported on plastic purchase cards.

## Introduction

Innovation is of paramount importance to organizational development and competitiveness. While traditionally seen as a domain of private sector companies, innovation has increasingly become a critical capability for public sector organizations (Mack et al. 2008; Damanpour and Schneider 2009). Citizens across the globe increasingly expect government agencies to innovate and improve their performance. One particular example of such innovation involves the purchase of and payment for goods and services, for which purchase card technology is well suited.

Government use of purchase card technology began in the 1980s motivated by a goal to simplify and reduce the cost of the acquisition process, particularly for high volume transactions of lesser value. Purchase cards increase the efficiency of the procure-to-payment cycle by the delegation of certain types of purchase decisions to employee-cardholders. The agency supports this decentralized purchasing activity by assigning each cardholder a (revolving) monthly credit line. This process reduces or eliminates many activities and paperwork previously required to process these purchases, including approvals, requisitions, purchase orders, invoices, and payment while increasing days that payables are outstanding by extending the time to payment (Federal Reserve Bank of Philadelphia 2011; McHugh 2011).

## Benefits of Purchase Cards

Estimates of government agency cost savings by use of purchase cards have ranged from $54 to $92 (Cohen 1998; U.S. GAO 1996). The General Services Administration (GSA) of the United States estimates that, on average, government agencies save about $70 per transaction in administrative cost savings each time a purchase card is used (instead of a paper procedure) (US GSA 2019a). Survey research has found that organizations adopting purchase cards report transaction cost savings, process simplification, increased working capital, cycle time improvement, increased spending transparency, rebates (cash back incentives from card issuers), and other benefits often idiosyncratic to their agency activities (RPMG Research Corporation 2017). Specifically, RPMG reported purchase card benefits of: (a) a 78% reduction in the administrative cost of procuring and paying for a good or service (from $89.99 per transaction via the traditional paper-based purchase order process to $20.14 per transaction via purchase cards), (b) a 39% reduction in approval requirements, where the traditional purchase order method requires 2.3 approvals prior to a $2000 payment for goods while a purchase card-enabled process requires only 1.4 approvals, (c) 29 additional days of "float" (time between charging the card and payment to the issuer), leading to working capital savings associated

with card purchases that equate to a 0.4% discount on the price of goods and services bought, (d) a 71% reduction in the average procurement cycle time (from need identification to receipt of goods), going from 9.9 days via the traditional purchase order-based process to 2.9 days via purchase cards, and (e) rebates from the card issuer, with the vast majority (82%) of card-using organizations reporting receipt of a rebate for purchase card spending in the past year. Additionally, 86% of respondents recognize a reduced reliance on checks as a moderate to extremely valuable aspect of purchase cards, 62% report reductions in the manpower required to conduct Purchase and Accounts Payable department activities, and among organizations that use purchase card spending data in discount negotiations, 56% report obtaining a higher discount, with an absolute improvement in the discount, on average, of 1.9%. Indeed, card issuers promote the concept of transforming the traditional government Accounts Payable cost center into a revenue generating component of the agency, principally by improving liquidity, reducing manpower needs, and obtaining incentive spending rebates.

## Governmental Use of Purchase Cards

The early history and development of purchase card use in government between 1982 and 2000 has been reported by Gupta and Palmer (2008). Since 2000, the transformation of the procurement process by purchase cards has grown steadily across the globe and now represents a new normal in the procurement process of governmental entities in many advanced economies, including the United States, Canada, the United Kingdom, France, and Australia. The most transparent example of governmental purchase card use is found in the United States, as other countries' program spend data is not consistently reported. For example, the Canadian "acquisition" card accounted for $600 million of spending in 2005 (OAGC 2007) and in fiscal year 2010–2011, the United Kingdom reported government procurement card spending of £322 million (Morse 2012).

Purchase card use by the US Government, an early adopter and the most prolific example of card potential, has grown from $56 million in 1990 to almost $22 billion per year in 2019. Specifically, over 450,000 US Government cardholders combined to spend $21.9 billion on purchase cards in the conduct of 21.3 million transactions in 2019 (US GSA 2019b), generating administrative cost savings of $1.5 billion per year at a government-recognized process cost savings per transaction of $70 (US GSA 2019a), in addition to a card issuer rebate of $277 million (US GSA 2019b). It should be noted that the total refund of $420 million reported by the GSA also includes that based on travel and fleet card spending; a more appropriate estimate of rebates due solely to purchase card spending would be $277 million.

## Ongoing Evolution of Purchase Card Technology

Card issuers recognize the important role they now play in government procurement transactions and have continuously upgraded their products in response to changing requirements of the governmental sector. When the US government first visualized the use of bank charge cards as a transformative technology, it envisioned the distribution of plastic cards across the employee base culminating in one invoice to satisfy payment for thousands of small transactions. Today, card payment technologies (and complementary software) have evolved, in particular to meet the ever-increasing demand for compliance and control over the procurement process. A new payment channel, "virtual cards," now enables a government agency to customize a card-based line of credit to support a single transaction in payment of an invoice. Likewise, card numbers to transact a single purchase can be sent to mobile devices, which then can be used to capture and store a digital representation of the purchase documentation. Electronic controls enable an agency to limit the amount spent on a per-transaction and/or monthly basis and limit the types of suppliers from which purchases can be made. Bank card data can now be transferred seamlessly into the agency's accounting information system (with each card account tied to a specific budget line).

Data mining software enables an agency to probe buying behavior at a detailed level (e.g., was a purchase made on the weekend, late night, or from a vendor whose owner lives at the same address as an employee).

Given the changes in card technology, government agencies are seeing the use of card accounts for purchases of increasingly higher transaction amounts. For example, the US government reported that 54% of its purchase card-type spending was for transactions in excess of $3500 in 2018 (US GSA 2018). The Department of Veterans Affairs, the US government agency with the highest annual spending, reported that almost 70% of its spending was for transactions exceeding $3500, accounting for 38% of all spending by the US government.

In 2017, GSA contracted with two banks (US Bank and Citibank) to provide purchase, travel, fleet, and integrated payment solutions. Collectively these contracts are known as the GSA SmartPay 3 Master Contract. The current contract, which began in December 2018, is estimated to be worth $700 billion dollars, encompasses numerous card payment tools and support technology, and can potentially run through 2031 (US GSA 2017).

## Implementation Challenges

Notwithstanding the widespread use of purchase cards, improvements in card technology, and the potential benefits of an Accounts Payable profit center, significant ongoing implementation challenges persist. Consistent with research reporting a 50% failure rate associated with the implementations of major technological and administrative changes (Aiman-Smith and Green 2002; Baer and Frese 2003), most purchase card-using organizations achieve only a fraction of the benefit expected with the adoption of purchase cards. In fact, based on market survey data, RPMG Research (2017) estimated that 81% of all purchase card spending was conducted by 20% of survey respondents. Most notably, the 20% of respondents accountable for a high proportion of market spending engage in a variety of unique and specific "best-in-class" activities (e.g., levels of card distribution, program policies) that, if migrated to other agencies, could help government achieve the maximum value promised with card use. Most of the challenges that hold back the 80% of respondents that account for a mere 19% of spending relate to routine "change management" issues, but some relate to card misuse by employees. For example, the Government Accountability Office reported on a variety of card misuse incidents among military agencies in the 2000–2004 time period, causing those agencies to cut card distribution by half, resulting in dramatically reduced spending that still exists to this day, notwithstanding many subsequent improvements in technology to control cardholder activity (Palmer et al. 2010, 2015). Most organizations, however, do not experience material amounts of card misuse and find that the benefits significantly outweigh occasional events of misuse (which can be controlled through proper policies, procedures, and technology). In 2017, for example, the losses associated with purchase card fraud and employee misrepresentation accounted for only 0.009% of purchase card spending, or 0.9 "basis points," which is the equivalent of $90 of fraud and misrepresentation loss to the organization for every $1 million of purchase card spending (RPMG Research Corporation 2017). Likewise, the aggregate loss associated with policy violations remains relatively small and materially insignificant, accounting for 0.007% of purchase card spending (or $70 of policy violations for every $1 million of purchase card spending).

## Conclusion

Citizens across the globe increasingly expect their government to innovate and enhance performance. One particular area where this innovation is occurring is in the routine business processes surrounding the purchase of and payment for goods and services, for which purchase card technology is well suited. While the United States has taken a clear lead in the use of purchase card technology, other governments have adopted this option. While the benefits of card technology are self-evident, government agencies have unique

implementation challenges. In particular, there is a high sensitivity to any misuse of public funds and the public trust. Therefore, governmental agencies have cautiously expanded their use of card technology since 1990 as card technology has evolved to address compliance and control concerns.

## Synonyms

Collaborative public procurement governance; Procurement process; Public procurement; Public values

## Definition

Collaborative public procurement governance is an innovation in the procurement system which puts public values at its core. With public value as the focus, certain values such as public environmental values, social values and sustainable development values which refer to "green procurement", "social procurement" and "sustainable procurement" are promoted among the public procurement processes.

## Introduction

The essential function of any state is to provide public services to its citizens in order to realize, preserve, and enhance public values; these include social welfare, social justice, and citizens' happiness. A successful state that which succeeds in providing good public services, while a failed state is one that has failed to provide such services. However, every state needs an optimal budget for public service spending. The "optimal budget" means that the state is able to disburse its budget efficiently, effectively, and accountably; in other words, a big budget does not guarantee enhancing a good output or good public services. In some countries, greater public budget spending has encouraged the smaller budget due to corruption. In this sense, the greater public budget needs better management of public spending, and the management needs the best public procurement. However, most public procurement practices are only concerned with value for money rather than for public values. In other words, public procurement should go beyond the efficiency and effectiveness value to the public value, to promoting equality on the basis of ethnicity from Malaysia and the USA, for example. It rests on a fuller and rounder vision of humanity than do either traditional public administration or new public management (Stoker 2006).

## Procurement Governance Environment

How do we measure the quality of government for public value? There are four approaches for measuring it: procedural, capacity, output, and bureaucratic autonomy (Bryson et al. 2006; Fukuyama 2016; Stoker 2006). The procurement process can be a government process based on the rule-bound institution that is mechanically tasked with carrying out the functions set by the principal capacity (procedural approach) to carry them out, to ensure the quality of output in order to achieve the highest quality of public service (Fukuyama, 2016). However, the government's capacity for implementing the procurement process is not only affected by one government institution, but also by the collaboration of many government, community, and private sector institutions. In fact, since a government's budget is distributed to many institutions, the procurement institution should have the capacity to enhance the collaboration among the others. In this sense, the leading institution in procurement could be the pivotal point to address.

From a scientific point of view, a procurement research focused in one organization is inadequate in expounding the empirical situation, therefore requires to focus more on a network of organizations. Secondly, the principal-agent theory can be the dominant approach in the procurement research but it is not sufficient to explain profoundly the issues related to the procurement process such as corruption. Hence, the role of a community organization in this process is challenging to address and explore. Many of the best practices of a good procurement process show the important role of community institutions in this process. There should not be a great separation between the client and contractor; both should see each other as partners looking to sustain a relationship over the long run and should not be narrowly focused on any contract (Stoker 2006) and look beyond choosing the "best supplier," and instead examine how to manage suppliers within a portfolio of market relationships (Caldwell et al. 2005).

## Procurement Process

As a first step of public services, public procurement is a system and not just an organization or

even cross-organizations or network procurement. Procurement governance should be collaborative as a process of establishing or forging agreement, steering, or building leadership and legitimacy, facilitating or building trust, and operating and monitoring cross-sectoral organization arrangements to address public policy problems that cannot easily be addressed by a single organization in the public sector alone (Ansell and Gash 2008; Bryson et al. 2009). Thus, the capacity of the cross-sectoral partnerships to establish, steer, facilitate, operate, and monitor the procurement process to provide public goods and services is undeniably necessary. The main point of forging cross-sectoral procurement arrangement is to build trust and share common intentions among partners. Each government agency has to agree on the procurement norms, missions and visions. The procurement function principle is accomplished by the independent body without political intervention, and is based on fairness, competition, efficiency, and effectiveness; a conflicting vision and goal among implementing agencies and auditing agencies will lead to failure of procurement.

Steering or building leadership is an important function of procurement agencies. How do they guide one or more government agencies, private organizations, and the public to an acceptable procurement process? Steering needs institutional leadership power, and in some countries, the procurement agency has great power to execute and steer other government organizations. Veto power is an example of power for a procurement agency that refers to the authority of the procurement agency to supervise the procurement process. In so doing, the procurement agencies have

- A vision and mission;
- A procurement plan;
- Procurement process standards;
- Procurement monitoring;
- Procurement auditing; and
- Public participation.

Procurement vision, mission, and plan (PVMP) is guiding the "what-who-where-when-why and how" (5 W and 1 H) to the use of a public budget. What are the public values beyond efficiency, effectiveness, fairness, competition, and accountability that have to be achieved through public procurement? PVMP should inherently look for the public values. The number of hospitals, for example, that have to be built not only to accommodate the number of patients who can be treated, but also the life expectancy that could be achieved within the context of their involvement in networks and partnerships – that is, their relationships with others formed within the context of mutual respect and shared learning between the provider and the citizen as users – are all taken into account (Stoker 2006). The delivered goods and services to citizens aim to satisfy the citizen's needs and at the same time a way of shaping public values. In a traditional public procurement system, the relationships between government and the private sector as providers is considered to be a short-term contractual relationship perspective. However, in collaborative public procurement, such a relationship is based on long-term relations or on the trust, learning, and social process of each for the public interest.

## Procurement Governance Structure

This plan is transferred from an annual budget plan. In the diverse or decentralized procurement agencies, the procurement plan is fragmented and divided into various plans; otherwise, the centralized procurement system has a unified procurement plan. Hence, the procurement plan, as discussed before, needs one authority to be established. How does the procurement system in the diverse procurement system or decentralized procurement system work? It is important to note that although many government agencies have independent procurement authority, there is a need to consolidate the procurement process among many agencies. If this step fails, it fails to obtain public goods. The question that have to be answered are "Does public service advances valued social and economic outcomes?" and "Does public service deliver public value?" A judgment can only be made within the context of debate and deliberation (Stoker 2006).

However, a fragmented procurement process will lead to poor-quality public services; otherwise, the structure and process of public procurement is organized in cross-sectoral procurement as the best way to spend government budgeting for public services, or the best way to obtain more benefits. Hence, this paper suggests that a collaborative public procurement should be realized and appreciated beyond the centralized or decentralized nature of public procurement system. In other words, a better cross-sectoral procurement is directly related to better public service, and it then has an impact on better public values. Using "information communication technology," e.g., the e-procurement system under an e-procurement plan, is one way to coordinate and consolidate the procurement plan. Are there networks of deliberation and delivery in pursuit of public value in the public e-procurement process?

Steering and facilitating is the most difficult task for many agencies involved in public procurement. How do so many agencies work on one vision and mission? In this process, strong leadership is pivotal for steering the complex public procurement process that goes beyond traditional values, but for public values? Why do we need public procurement? The head of the government or the person in-charged with the public procurement system must arrange public procurement in a practical way. In doing so, policies, protocols, and public procurement systems should be put in place as they is where public service and public goods will be carried out. The role of the head of public procurement has expanded to ensure that the practices and norms applied to deliver public service are appropriate in order to promote public justice. The advancement of public justice implies embracing new ways of governance that are adapted from the current practices in public procurement. The collaborative governance on procurement show that the agencies involved and the procurement process have been integrated into one single procurement network bound by a common vision and goals as well as committed to providing better public services and goods.

Co-production in public services is a good example of public procurement in which community, as a target of the procured goods and services, is involved in procurement planning, implementing, and evaluation. However, achieving public justice through collaborative governance in procurement may be ideal, but it is hardly a panacea. Within these integrated agencies lie dynamic interests and power imbalances that affect the processes, structure, and governance of the network on public procurement (Fig. 1). On the other hand, the collaboration between these agencies in the pursuit of public justice may be challenging, but the benefits definitely outweigh the costs. Hence, the head of public procurement system must be equipped with the indispensable skills to hold the network together and succeed. But how can a leader possibly succeed in navigating the groups of agencies/organizations towards public procurement that ensure the promotion of public values and justice? Is it even possible?

The guiding principle behind monitoring public procurement systems is "value for money. Establishing the monitoring of public procurement mechanisms is crucial for all government agencies, as it comprises the organized scrutiny of public procurement systems directed towards a logical way of measuring how the system works and if such a system functions according to the targets and purposes when it was established. Current thrusts are focused on effective, efficient, and transparent procurement systems towards better public service. Will collaborative governance in monitoring procurement systems work? Inter-organizational partnerships are necessary but not sufficient for providing the best possible services as the latter are born out of the interaction of public service systems that are beyond the governance of networks among public service organizations (Osborne et al. 2015). Hence, the complexity of monitoring public procurement systems has urged international organizations to come up with mechanisms and tools for monitoring. Nowadays, the tools and mechanisms for monitoring are evolving, where others use ICT (information communication technology) because it promotes transparency and collaboration in government. The essence of monitoring public procurement systems is guaranteeing that there are no violations of the procurement rules.

**Putting Public Values in Public Procurement Agenda, Fig. 1** A framework for understanding cross-sector collaborations (Adapted from Bryson et al. (2006))

However, is monitoring a public procurement system enough to promote better public services and goods?

To further ensure the value of the peoples' money, a public procurement system is not only monitored, but is also subjected to audit. Procurement auditing standards strengthen and evaluate the effectiveness of an agency's internal control mechanisms and ensure compliance with existing laws and regulations. Sustaining an effective system of internal controls prevents fraud and the misappropriation of funds. The significance and quality of an auditing system relies on the reputation of the auditor; hence, there is a need for agencies to come up with alternative mechanisms for enhancing the credibility of the audit. The sustainability of an appropriate and dependable audit procurement system reflects the quality of governance, and it takes exceptional leadership with strong political determination and commitment to the greater good of the public to implement such a structure. Despite the virtue of providing better services for the public, the road is not yet paved. Collaborative governance,

together with strong public participation, reinforces the goals of auditing procurement systems.

Access to relevant information boosts the oversight capacity of the citizens into the affairs of the government institutions, particularly in the procurement processes. With their functions as "watchdogs," citizens – through Civil Society Organizations (CSOs) – can possible detect, prevent, and reduce corruption by being involved in every stage of the process. Part of being involved is the assurance that the procurement is responsive to the needs of the people themselves and that they can therefore make suggestions for improvement, or objections in the process if necessary. In this way, transparency and legitimacy of the entire process is enhanced. The increasing demand for transparency and the access to official and relevant information that augments the integrity of procurement has resulted in the publication of the desired data in platforms that restrict the use of such information. Hence, citizen participation is limited in most countries around the world, the substantial data that proves the worth of public participation in public procurement transactions of governments notwithstanding.

This is where public service and public value as measurements of public service effectiveness become very interesting and very important. Public value shifts the focus of reforming public services away from internal efficiency alone and instead places it within the context of adding value to the lives of citizens and service users – while also acknowledging that such "value" is negotiated within the democratic polity (Stoker 2009).

The most important objective of goods and services procurement is achieving public values. The outcome of hospital building procurement is to improve the life expectancy of the community in its service area. Consequently, the successful measurement of public procurement can be defined clearly and declared in the procurement process. Auditors should assess the outcome projection of the delivered goods and services that go beyond the conventional auditing system. Accountability in a public procurement system is not only for meeting financial standards, but also for achieving public values. The auditors should look at the outcome of goods and services or third-order value, such as new collaborations; more co-evolution and less destructive conflict among partners; results on the ground, such as the adaptation of services, resources, cities, and regions; new institutions; new norms and social heuristics for addressing public problems; and new modes of discourse (Bryson et al. 2006).

## Conclusions

Public procurement is at the heart of the public services that should go beyond the technical matters; it guides the field in public administration for public preferences, promoting the common good, and preventing public value failure. However, it also creates dilemmas – between efficiency, effectiveness, and output on the one hand, and justice, social welfare, and happiness on the other. Collaborative public procurement is an essential approach to advance public values in the delivery of public goods and services. Value – laden concepts such as "green procurement", "social procurement" and "sustainable procurement" practically reflects effective governance and good public service delivery through collaborative public procurement.

### Synonyms

Quality management; Service quality management; Total quality

### Definitions

**Bedouin:** Nomadic Arab tribes and their descendants who are widespread all over the Arabian Peninsula.

**TQM:** A philosophy behind the practice of continuously improving the quality of goods and services delivered through the participation of 'all' levels and functions of the organization.

**Internal stakeholders:** Refer to the executives, managers, and employees in an organization.

**TQM thinking orientation:** The mindset towards quality and familiarity with TQM.

### Introduction

The great optimism and passion for quality improvement in the UAE had created the imperative for all government entities to deliver quality services to the community. At the frontline of this endeavor are the municipalities which serve as important channels of the federal government in ensuring that this mandate is attained. With the increasing momentum of globalization, municipalities are faced with the challenge of developing the right approaches that will enhance their performance. One of the approaches that seem to provide the solution to problems faced by the public sector is the management philosophy of total quality management or TQM (Masejane 2012).

The total quality concept was transferred from the private to the public sector services in the late 1980s where customer satisfaction became the measure of the degree of quality services provided to the public (Masejane 2012). As a result, government units from the federal to the local levels sought TQM as a panacea for the problems they faced. It had been observed that although local governments such as municipalities are making good progress and are working on innovative solutions to address the most pressing problems of their citizens, the functioning of some municipalities as administrative systems make them still retain many of the bureaucratic characteristics where services are characteristically delivered in an administrative and legalistic manner (Ayton

© Springer Nature Switzerland AG 2022
A. Farazmand (ed.), *Global Encyclopedia of Public Administration, Public Policy, and Governance*,
https://doi.org/10.1007/978-3-030-66252-3

2013). Other barriers can also include the hierarchical structure of municipalities: low levels of training; poor work culture; resistance to change on the part of employees; and lack of consensus on how to implement the process (Bvuma and Russel (2001).

From the service consumer side, citizens have become increasingly discerning and discriminating in the services that are provided to them, and they continue to seek options that are more in tune with their needs, demands, and expectations. This calls for decision makers in municipalities to look at the totality of service quality that they continually provide to the end-users. Hence TQM also became an appealing option to address the issues and concerns of the citizens in order to provide services that are of the quality defined by the consumers and end-users. This largely requires the implementation of the necessary structural, procedural, cultural, and leadership changes in municipalities.

## Quality in the UAE

The UAE is currently one of the countries that recognize the vital role of continuous improvement, productivity, quality, customer experience, and competitiveness to nation-building. Delivering quality services by government entities in the UAE is not only expected but an imperative and mandate as well. This makes TQM is a state-sponsored initiative in the country. In the UAE, the metaphor adopted to highlight its quality initiatives is a "journey," which symbolizes the move forward in achieving its quality goals. The American Society for Quality gave credit to the emirate of Dubai as the forerunner in the quality journey of the UAE when it launched the Dubai Quality Award in 1994 (Thawani 2014). This award was patterned after the Malcolm Baldrige Award, an award given in the United States to organizations that have demonstrated quality and performance excellence (ASQ 2015). Although the Malcolm Baldrige Award has a government category, the Dubai Quality Award was largely intended only for private sector organizations in the UAE. The corollary to this was the establishment of the Dubai Quality Group which made positive contributions in raising the voice of quality in the emirate.

Through the years, nine prestigious awards had been created and given annually in recognition of the initiatives of the private and public sectors in improving quality. Of all the awards given, the Emirates Government Excellence Award is considered the most prestigious. Launched in 2009, the award covers all federal government entities and their roles in better serving communities. The award consists of 22 categories designed to cover all facets of work. The categories include individual awards, work teams, best practice, constituent parts of government entities, and distinguished federal entities (Ministry of Cabinet Affairs 2014). In Abu Dhabi, in particular, the principles of excellence and quality are enshrined in Abu Dhabi Economic Vision 2030 which was launched in 2007. The vision and its underlying policies and strategies serve as a roadmap for the emirate in negotiating its economic future. It lays out a 22-year strategy for the government which started in 2008 to ensure a safe and secure society and a dynamic open economy (The Government of Abu Dhabi 2008). One of the policies of the vision that has a bearing on quality and excellence is the optimization of government operations. The policy's agenda focuses on improving the efficiency and accountability of government departments. In municipalities, activities are ongoing that will enhance maximum efficiency.

## Al Ain Municipality

The quality movement in the UAE has a direct bearing on the implementation of TQM in Al Ain Municipality. Al Ain holds many of the emirate's greatest cultural assets relating to the national population's Bedouin roots and culture. It covers an area of 1,270,000 hectares and is characterized by the diverse landscapes of sweeping dunes and alluvial planes, along with agricultural activity and animal husbandry. As such, Al Ain is rich in areas of archaeological and environmental importance. Al Ain is also an important economic and social hub and is home to more than 400,000 residents (Department of Municipal Affairs

2014). Al Ain City Municipality stands at the forefront of development in the area through the role it plays and the programs and services it provides for improving the quality of life to the highest possible standards. The municipality offers a range of services to citizens to achieve its vision of being recognized as an efficient world-class municipality. The main customers of the municipality are the citizens of Al Ain who are the end users of the services such as public sanitation, roads and infrastructure, procurement, and urban planning. Increasing emphasis on better governance and performance in service delivery has resulted in complex internal business processes at the Al Ain Municipality which require the effective implementation of TQM. The success of implementation would largely depend on the thinking orientation of the executives and staff and the extent to which they perceived and addressed the challenges in the field.

## TQM Thinking Orientation

The directors, department heads, and employees of Al Ain Municipality appeared to have the consensus that quality means working in teams to achieve goals that translate to both the satisfaction of external and internal customers. Unfortunately, less than a quarter of the employees was not familiar with TQM and claimed that they just heard of the term or that they were totally unaware of it. Greater familiarity with TQM was seen among the directors and department heads as well as the older and more experienced members of the staff.

In terms of critical success factors, the directors, department heads, and staff held similar views regarding the importance of culture, leadership, communication, commitment, stakeholder-focus, continuous improvement, rewards, involvement and empowerment, training and education, and tools and techniques, in the implementation of TQM in Al Ain Municipality. This highlights the importance of strategic, structural, human resource, contextual, and procedural factors in implementing TQM. This includes the hard and soft elements of TQM as well as the importance of the tools, values, and methodologies essential to TQM implementation.

## The Need for a Robust Strategy

The extent of understanding the quality concept and familiarity with TQM are concrete indicators of the municipal government's response to the quality initiatives undertaken in the government sector in the UAE. The lack of familiarity of less than a quarter of the staff in Al Ain Municipality needs to be taken seriously and is a wake-up call for the municipal government to address. The failure to attain the total attribute of TQM despite its adoption in the municipality is a constraint to its implementation. Being familiar with the concept is a pre-requisite to understanding one's role in implementing the process; hence the municipal government needs to exert more effort in improving the quality thinking and employee orientation towards the total understanding of the quality concept to attain consistency between thought and action in the delivery of TQM-based services.

The directors, department heads, and employees also perceived that the adoption and implementation of TQM in Al Ain Municipality can be potentially derailed by a number of perceived barriers that cut across the organization. This need to be addressed to optimize the potentials of TQM in providing quality services in the municipality which requires the adoption of proactive approaches in addressing these barriers through continuous improvement because simply navigating through these rough roads would not suffice to break down the barriers. The challenges perceived using the typology of Mosadeghrad (2014) were a mix of strategic, structural, human resources, contextual, or procedural barriers. Accordingly, strategic barriers were related mainly to the management and leadership of the organization. Human resource barriers were related to human factors in the organization. Structural barriers were related to the structure, systems, and physical resources required for implementing TQM. Contextual barriers pertained to the underdevelopment of the context and culture to optimize the potential of TQM

**Quality Management in Al Ain Municipality, Abu Dhabi, UAE,**
**Fig. 1** Framework for the development of functional TQM strategies

implementation. Procedural barriers referred to the obstacles encountered during the implementation of TQM in the municipality.

The critical success factors perceived by the directors, department heads, and employees were combinations of soft and hard elements of TQM with greater importance given to process management, training and education, and quality culture. The hard and soft elements of TQM were viewed with an equal significance which embodied the tools, values, and methodologies essential to TQM implementation. This signals the expectations of the internal stakeholders on how TQM should be implemented in the municipality and serves as a relevant piece of information to the decision-makers, the quality department, and the training departments of the municipality.

Despite the diversity of their attributes, the directors, department heads, and employees had a homogeneous perception on the low extent of TQM implementation in Al Ain Municipality because of the persistence of perceived barriers. Hence addressing the challenges faced by the municipality would likely improve the implementation of TQM. Likewise, enhancing the views of the employees on TQM would likely improve implementation as they become more responsive in responding to the serious barriers operating that can hinder effective TQM implementation.

These generally signals (a) the need for strategies to address the challenges which are already endemic in the municipality and (b) the need for organizational interventions to enhance and sustain TQM thinking orientation and TQM execution. These became the basis of the building blocks of edifying the TQM framework shown in Fig. 1.

The inputs consist of strategic, human resource, structural, contextual, and procedural factors essential in building, supporting, and enhancing the TQM strategy. TQM values, methods, and technologies are embedded in the organizational learning process to create the necessary environment for the confluence of people, process, policies, and technology in implementing TQM. The output expected is an enhanced implementation of the TQM strategy which will be subject to periodic quality performance monitoring and evaluation. This model is addressed primarily to the (1) decision-makers of the municipality on whose shoulders fall the development of organizational strategy; (2) the quality department to support the development of the strategy; and (3) the human resource department for the system-wide implementation of the necessary learning and development programs for the success of the strategy.

On the whole, novel and bold strategies have to be developed to enhance the structural,

strategic, human resource, contextual, and procedural dimensions of TQM implementation (inputs). These have to be sustained in an environment of continuous learning characteristic of a learning organization which will create an atmosphere where the values, methods, and technologies of TQM would be continuously enhanced (process) to bring about improved service delivery to the community (output). All efforts to improved quality need to be monitored and documented to have a feedback of TQM execution and a basis for continuous quality improvement.

The framework has to be enhanced by enabling elements to fulfill its requirements. As a corollary, the following are required to support the framework:

1. Create an information-rich environment backstopped by multimedia communication and deliberately designed contents that would initiate conversation on TQM along all levels of the organization.
2. Expand the function of the quality department beyond its current functions that are external-stakeholder focused to one that gives due attention to internal stakeholders of the organization.
3. Make learning and development a norm in the organizational culture by creating a strategic space where the TQM philosophy becomes embedded in the lived experiences of the executives and employees.
4. Expand the function of training and development to include enhancing of the values of TQM; developing the capabilities in implementing the methods of TQM and employing the latest technologies of TQM.
5. Adopt the appropriate state-of-the-art technologies to support the delivery of quality services in the municipality. This entails a thorough assessment of the technologies that are compatible with the values and methods of TQM that promotes efficiency, effectiveness, and excellence in service delivery.
6. Engage employee participation in setting quality objectives and goals at all levels in order to foster greater ownership, involvement, commitment, and corporate citizenship.
7. Document best practices and success stories that will not only inspire and motivate the internal stakeholders' commitment to quality but will also serve as benchmarks in the quest of continuously improving the ways of doing work.
8. Develop a strategic TQM plan that would promote key TQM practices for the organization and create a dynamic quality-oriented environment for implementation.
9. Transform all work teams to decentralized quality improvement teams that are empowered with the capability to solve quality-related issues in quick time without delay and to communicate all the relevant activities, progress, and result to the team members and management.
10. Sustain the processes by developing internal monitoring mechanisms and control processes that would allow managers and employees to respond to feedback in real time. There should be a component of the process that would frequently review and improve the quality plans and measure performance.

## Conclusion

The very essence of TQM lies in its attribute of totality. This means, all must embrace the philosophy. This has to start with developing a strong familiarity with TQM among the executives and employees to internalize TQM as a philosophy behind the practice of continuously improving the quality of goods and services delivered through the participation of "all" levels and functions of the organizations using proper tools, technology, and training to meet customer's expectations on a continuous basis, which is still a potential area for improvement in the municipality.

The successful implementation of TQM in the municipality can be potentially driven by the right environment for the adoption, internalization, and

institutionalization of quality principles and sustaining the promotion, development, and enhancement of the values, technologies, and methodologies of TQM. This highlights the role of enablers in the institutionalization of quality values, establishment of quality processes, and implementation of the right quality results.

An essential consideration in the implementation of TQM in the municipality is to pay heed to the views and perceptions of the human elements. These can serve as critical feedbacks for the continuous improvement initiatives and these can also be leveraged to engage internal stakeholders to obtain the potential optimal benefits of TQM. This relates to the ultimate realization, that organizations mean people.

## Definition

Quantitative method is the collection and analysis of numerical data to answer scientific research questions. Quantitative method is used to summarize, average, find patterns, make predictions, and test causal associations as well as generalizing results to wider populations. It allows us to quantify effect sizes, determine the strength of associations, rank priorities, and weigh the strength of evidence of effectiveness.

## Introduction

This entry aims to introduce the most common ways to use numbers and statistics to describe variables, establish relationships among variables, and build numerical understanding of a topic. In general, the quantitative research process uses a deductive approach (Neuman

2014; Leavy 2017), extrapolating from a particular case to the general situation (Babones 2016).

In practical ways, quantitative methods are an approach to studying a research topic. In research, the investigator needs to choose specific techniques to collect, analyze, and interpret data according to the problem's nature or the research question under study. For example, a researcher may want to know the top ten leading causes of diseases affecting a country. The most appropriate way of addressing this is by using data from a national survey, one of the most common instruments for primary data collection and secondary analysis in quantitative research. In this case, a national health survey provides quantitative data on the scope and distribution of illnesses at a national level by studying a representative sample of the whole population. However, it will be hard to understand people's challenges with visual impairment when trying to access public services with a quantitative survey. In this case, applying a qualitative method for data collection and analysis can provide a better understanding of their experiences and challenges.

Some examples of research questions that can be answered using quantitative methods are:

- What proportion of people were born outside of a country?
- How much rainfall was there in a region in 2020?
- Does a strict lockdown prevent new cases of COVID-19?
- Is drug A more effective than drug B in preventing liver cancer from hepatitis C?

In order to answer these questions, the researcher must choose an appropriate method of enquiry.

## Methods of Inquiry

Methods in quantitative research can broadly be classified as observational or experimental.

## Observational Research Method: Quantitative Survey

The survey is a common technique in quantitative observational research (Creswell 2014); it provides a numeric description of sample characteristics or the whole population under study (Balnaves and Caputi 2001). It is widely used in a variety of fields to generate information. When working with data from a representative sample, the results can be generalized to the entire population. Surveys usually consist of standardized questions analyzed using descriptive and inferential statistical tools. When working with surveys, it is necessary to take into consideration the following:

**Aim**: Have a clear purpose for the survey.

**Characteristics of the population**: Knowing the whole population's size is critical to determine representative sample size. This aspect is also essential if the study requires specific characteristics to be present in the sample, such as having the same number of male and female participants.

**Data collection**: There are many ways in which survey data can be collected: Internet, telephone, using regular mail, or face to face (Treiman 2009). The method chosen will depend on the time and resources available.

**Response rate**: Survey response rates are often low. A sampling protocol needs to establish ways to direct the survey to the right respondents (the target group) to gain a greater response and generate more accurate data.

**Sampling technique**: The sampling protocol should also specify a sampling technique: *simple random* (every individual has the same probability of being selected to take part in the study), *systematic* (participants are selected in defined criteria), *cluster* (instead of just looking at individuals, the population is divided into groups (e.g., schools, local government areas) which represent a unit of study that latter can be randomly selected to be included in the study), and *stratified* (participants are divided into groups with similar characteristics) (Brenner 2020).

**Survey design**: There are two survey designs: cross-sectional and longitudinal (Neuman 2014). The first one collects information at one point in time, and the latter collects information at multiple points in time. There are three types of longitudinal studies: cohort (follows the same population across time, usually starting at birth), trend (like a cross-sectional survey, but repeated multiple times to different people), and panel (ask the same people, the same questions over time).

**Survey instrument**: Depending on the nature of the topic and the resources available, the researcher can choose to use an existing instrument, a modified instrument, or design a new instrument. In all the cases, the instrument should be tested for validity (instrument measures what it is supposed to measure) and reliability (instrument is consistent between measurements) (Creswell 2014).

## Experimental Research Method

Experimental research is the oldest form of quantitative research (Creswell 2014). It aims to identify relationships between variables by measuring direct observations. Therefore, it requires observation and testing of the cause-effect relationship between two or more variables (dependent and independent). In a laboratory setting, the independent variable is often called the "exposure." It can be a new drug or a vaccine. The dependent variable is an outcome that "depends" on the exposure. It can be the infection rate, cell proliferation, or enzyme activity. Outside of a laboratory setting, the exposure can be the habit of smoking cigarettes or performing a specific job type. Exposure is a characteristic that is being manipulated or assigned for the study.

The dependent variable is the outcome variables influenced by the independent/exposure variable and confounders. The outcome variable is observed and measured but is not manipulated. It is usual in experimental design to have a second or third arm, where a different type of intervention or no intervention/placebo is being applied. However, this is an oversimplification of the reality when conducting experiments. When doing experimental research, it is necessary to take into consideration a wide variety of aspects:

**Hypothesis**: We should keep in mind that experimental research's main objective is hypothesis testing. However, to generate a well-sounded hypothesis, it is important to understand previous literature and theories. Based on that knowledge, a new hypothesis can be formulated and tested.

**Experimental design**: There are two broad ways of conducting experimental study: randomized controlled trial and quasi-experimental study. The first one is also known as the gold standard experimental design, where the participants are randomly allocated to the experimental treatment or intervention or a control/placebo arm where there is no intervention. Randomized controlled trial is viewed as strong causal study design. The second one is also known as causal comparative, where the researcher cannot allocate participants randomly, usually due to ethical reasons.

**Confounders**: Confounder is the common cause of exposure and outcome. In other words, confounders are additional variables that influence both independent and dependent variables. Confounders need to be taken into consideration. Otherwise, they may mask true effects. For example, in examining the association between smoking and lung cancer, researchers need to be aware that alcohol consumption is a confounder. This is because people who smoke are more likely to drink alcohol, and alcohol may also influence lung cancer. Without considering the confounding effect of alcohol, we may be misled into concluding that alcohol consumption causes lung cancer, not smoking. Here we say alcohol consumption "confounds" the (true) association between smoking and lung cancer. Researchers need to account for confounding variables to infer accurate conclusions.

**Control group or placebo**: A control group is a group with the same characteristics as the intervention groups at the start of the study but

receives placebo/no intervention. This allows the researcher to contrast the outcome between those who do and those who do not receive the intervention/treatment.

## Data Analysis Techniques

Data analysis depends on the study design and objectives of the study. There are two broad ways to approach data analysis: descriptive and inferential statistics.

## Descriptive Statistics

Descriptive statistics summarize information and provide a numerical description of the data. There are three ways in which data can be described: frequency, measures of central tendency, and using measures of dispersion.

## Frequency

Frequency provides the number of observations under a category. Usually, it is presented as a percentage. For example, we may describe boys' and girls' frequency who play soccer in school.

## Measures of Central Tendency

These types of measures have the characteristic of summing information. There are three measures to describe central tendency: mode, median, and mean. When all of these measures of central tendencies match, the data set is considered to follow a normal distribution.

**Mode**: Mode represents the most common observation. For example, ten people are weighted: four of them weight 75 kgs, and the rest of the participants weight 72, 66, 73, 76, 100, and 71 kgs. In this case, the mode is 75 kgs.

**Median**: The value in the middle of a set of numbers is organized from lowest to highest. Median is also defined as the middle point because 50% of the data is above this point and the other 50% is below.

**Mean**: Mean represents the average of the observations. To calculate the mean, all the observations are added up and then divided by the number of observations. It is important to keep in mind that the mean is affected by extreme values.

## Measures of Dispersion

These measures provide information on the variability within the data, which is not obtained using the measures for central tendency. There are four common ways to measure dispersion: range, interquartile range (IQR), standard deviation (SD), and Z-score

**Range**: The range is the difference between the extreme values: the minimum and maximum value. The calculation is simple; the lowest value of the observations is subtracted from the highest value.

**IQR:** Following the idea on the range, IQR is the difference between the 75th quartile and the 25th quartile.

**SD**: SD is the most common way to measure dispersion. It measures how far the data spread from the mean. If the SD is small, the data is close to the mean. On the contrary, if the SD is large, the data is spread away from the mean. SD is widely used in hypothesis testing.

**Z-score**: Z-score is a combined measure constructed using an SD and the mean, allowing comparisons among groups and distributions.

## Inferential Statistics

Inferential statistics go beyond description by aiming to estimate the strength and direction of relationships between variables and make inferences about a larger group using data from a representative sample of that group (Babones 2016). However, researchers need to be confident about these associations' strength since there is always chance of error. One of the main pillars of inferential statistics is hypothesis testing.

## Developing Hypothesis for Testing

Hypothesis testing can be confusing because the researcher must assume no difference or relationship between variables until proven to the contrary. This process involves creating two hypotheses: a null hypothesis and an alternative hypothesis. The null hypothesis ($H_o$) always states that there is no difference between one group (A) and another (B). The notation is $H_o$: $A = B$. The alternative hypothesis ($H_a$) states the opposite that there is a difference between one group (A) and another (B) ($H_a$: $A \neq B$). The idea is to prove the null hypothesis wrong or rejecting the null hypotheses. Some factors need to be considered to make a decision, such as the significance level, p-values, and types of errors (Type I and Type II).

## Significance Level (Alpha)

Alpha (α) refers to the probability of rejecting the null hypotheses when it is true. You say there is a difference between groups when there is no difference. The usual cutoff point for level of significance is set at 0.05. It can be interpreted as the probability (5%) of inappropriately rejecting the null hypothesis, which is known as a Type I error.

## Statistical Significance (P-value)

Statistical significance is used to ensure that the differences observed between two sample groups (experimental and control) are not due to chance alone; therefore, the difference observed is a real difference between the two groups. It is called P-value, and it can take any number between zero and one. Putting it in words, the P-value is the likelihood that the observed difference between groups is a finding by chance. The smaller the P-value, the greater our confidence that this is not a finding by chance and correct to reject the null hypothesis. By convention, if the P-value is less than 0.05, the null hypothesis can be rejected. It can be interpreted as having 95% probability that the results are not due to chance alone.

## Errors: Type I and Type II

The cutoff points established for the Alpha (α) and P-value are low; however, there is always a 5% chance of making an error. In hypothesis testing, we can have two types of errors: Type I and Type II (Neuman 2014). A Type I error is when a true null hypothesis is rejected (also defined as a false positive), which is a more problematic type of error. A Type II error is when the researcher accepts a false null hypothesis. This type of error is influenced by sample size and variability. It is less problematic than Type I error.

## Tests in Inferential Statistics

There are several tests in inferential statistics. Choosing the most appropriate test will depend on the nature of the data and the study objective (Mertens et al. 2018). Some of the most common tests are mention below:

- **Chi-square**: Chi-square test examines the association between two categorical variables.
- **Spearman correlation**: Spearman correlation tests the association of two ordinal variables.
- **Pearson correlation**: Pearson correlation measures the association between two continuous variables.
- **Paired t-test**: Paired t-test examines the difference between two variables in the same individuals of a population (e.g., test scores before and after an intervention).
- **Independent t-test**: Independent t-test examines the difference between two variables from different groups. For example, when analyzing a characteristic to see if it is different between boys and girls.
- **Analysis of variance (ANOVA):** ANOVA is used to compare the difference of two or more means from different groups.
- **Simple regression**: Simple regression estimates how much dependent variable changes

when independent variable change (e.g., how much blood pressure changes when body mass index changes).

- **Multiple regression**: Multiple regression estimates the changes in dependent variable based on multiple explanatory variablesor independent and confounding variables.

## Interpretation

To wrap up, data interpretation requires going back to the beginning and looking at the initial research question, observing new insights from, and drawing conclusions. Usually, these conclusions will have substantial policy implications or impacts on decision making.

## Conclusion

Simply, quantitative research methods are systematic ways of gathering and analyzing numerical data with the general purpose of understanding reality. Quantitative methods are mostly used to generalize results to a wider population, make predictions, infer causality, and prove hypotheses.

## Race, Arrest, and Sentencing as Social Policy

Carmela F. Staten
Jackson State University, Jackson, MS, USA
Mississippi Valley State University, Itta Bena, MS, USA

### Definition

Social policy, a subset of public policy, is "a course of government action or inaction" regarding social issues via "formally approved goals and means, as well as the regulations and practices of agencies that implement programs" (Kraft and Furlong 2013).

Not to be confused with public policy, social policy is limited to policy influencing the course of human lives, improving a citizen's well-being and action on issues affecting their welfare.

Public policy moves beyond solving social issues and as Thomas Dye explains is what government chooses to do or not. This choice is made on issues that may or may not affect a person directly. Those issues include but are not limited to tax, environmental, or international policy. Though they eventually affect a person's welfare, tax or environmental policy is not directly connected to it. Thus, all social policy is public policy, but not all public policy is social policy.

Social policy is focused on policy formulation and administration of social services and the promotion of the welfare of persons and family. This includes services for health, housing, income security, education, social work, poverty, disability, and family, among others.

### Introduction

Intended to improve the quality of life for citizens in a locale, social policy ranges from taxes to health care and surprisingly criminal justice. Born of the anxiety, concerns, perceptions of community members, politicians, lobbyist, and NGOs and policy makers at the federal, state, and local level create the criminal justice system by enacting policies that define or monitor prohibited behavior.

In adherence to the rule of law, these policies should be race, class, and socioeconomically neutral. However, because many of these laws have a disproportionate impact on minority communities, it leads objective observers to believe that minorities are committing more crime or that policies are not value-neutral or fairly applied.

In the examination of criminal justice polices involving arrest and sentencing, quantitative and qualitative data show that race influences every stage of the criminal justice system. Not always intentional or done with malice, the data infer definite racial bias. Communities of color are often unfairly overrepresented as perpetrators of crime in the media – which leads to policy development aimed at them; they appear to be targeted

or more harshly treated in encounters with police and receive unjust treatment, stiffer charges, and longer sentences via the court system. Race intersects with policy on arrest and sentencing at every level.

## Crime as Social Policy

Social policy merges into crime policy in two instances:

1. When citizens, because of increased crime in the community, feel unsafe and social policy is engaged to reduce crime.
2. As a result of over policing, arrest and harsh sentencing that negatively affects a family finances, family stability, children's health, education, or the general quality of life.

Social policies can be employed to curb crime or reverse/mitigate the effects of incarceration or reduce arrests of citizens. In this vein, we see that social policy can alleviate social problems or cause them. It can improve the quality of life and also serve to contain, control, and suppress people.

### Arrest and Sentencing Policy

Policy makers at the federal, state, and local level create the criminal justice system by enacting policies and laws and creating agencies that define or monitor prohibited behavior, the penalties for violating those laws, and the processes by which cases are to be disposed and sentences are to be determined. These policies are born of the anxiety, concerns, perceptions of communities, politicians, lobbyist, and NGOs on crime and its impact on community member's well-being and safety.

On its face, policy that governs arrest, prosecution, and confinement are race, class, and socioeconomically neutral. However, many of these laws have a disproportionate impact on minority communities. This impact is the result of the practice or implementation of the policy by the agency – leading a conscience observer to believe one of two things – minorities commit more crime or the policy is not neutral or fairly applied.

### Value Neutrality and the Rule of Law

> . . .the very definition of a republic is an empire of laws, and not of men. – John Adams (1851, p. 194)

Be they moral, ethical, legal, or emotional, some set of rules or principles guide our actions. Those rules also outline the reward or consequence we receive when we perform or neglect those actions. As it relates to government and legal rules, many of the world's governments have agreed to function under the principle of rule of law. Rule of law, contrasted with the rule of man, is a system by which persons are governed by law and not arbitrary decisions of individual government officials (Peacock 2010).

Historically, the rule of law became important when countries or groups of people sought to be free of absolute rule of men. Seeking a system where law was king (Peacock 2010), countries were founded and governments changed. John Adams in the 1780 Massachusetts Constitution put this principle into practice and declared that they would be "a government of laws and not of men" (Massachusetts Constitution 1780).

In 2015, derived from internationally accepted standards, the World Justice Project's definition of the rule of law is a system in which the government, individuals, and private entities are accountable under the law. Laws must be clear, publicized, stable, and just, are applied to all cases alike, and protect fundamental rights, including the security of persons and property and certain core human rights. The process by which the laws are enacted, administered, and enforced is accessible, fair, and efficient. Justice is delivered timely by competent, ethical, and independent representatives and neutrals who are of sufficient number, have adequate resources, and reflect the makeup of the communities they serve (Project 2015).

It requires that men be bound to a fair administration of the law, without regard to political philosophy or moral creed. The rule of men uses political and personal biases and beliefs and influences in the distribution of justice. Laws, its application, and even preferred case outcomes are all dependent on the ruling class. According to Smith

(2011, p. 59, 68), unlike the rule of men, the rule of law is to be value-neutral.

Value neutrality is a principle that asks the researcher, policy maker, or program administrator to reign in or keep emotions and biases in check in the performance of official duty. Max Weber, in his description of ethical research, asserts that it is vital that researchers identify and acknowledge their own values and personal biases when conducting research or analyzing a policy. Biases should be taken into consideration and consciously dismissed. Weber recommends value-neutral sociology in which a researcher may use their values as an object of analysis but must refrain from promoting or spreading them (Judge 2012, p. 150). Though initially limited to research, it is certainly applicable and consistent with the goal of the rule of law.

Bias on the part of the policy maker or administrator can hinder the fair application of law; thus, value neutrality can and should be applied to criminal justice policy development. Granted not all policy can be value-neutral, some problems to be solved may benefit from the value-laden principle – however, arrest and sentencing policy should be fixed, stable, equally applied, and fair. Neutrality is paramount.

In the examination of the role of race in criminal justice social policy, research suggests an absence of neutrality. Data imply that this is a result of value-laden policy development and administration. Intentional or not, there are significant racial disparities in arrest and sentencing. The overrepresentation of certain races in the criminal justice system is the result of dissimilar treatment of situationally alike people based on race. In some instances, this may involve overt racial bias, while in others it may reflect the influence of factors indirectly associated with race.

## Race, Arrest, and Sentencing

### Intersection of Race

As of 2014, the United States has nearly 2.4 million people incarcerated. Home to the world's highest incarceration rate, the United States, has over 6,500 detention facilities and is building more each year. This ever-growing number includes prisons, federal prisons, juvenile correctional facilities, local jails, Indian country jails as well as military prisons, immigration detention facilities, civil commitment centers, and prisons in the US territories (Justice 2016). In addition, there are nearly seven million people under some form of criminal justice supervision (probation, house arrest, etc.), and a disproportionate number of these are people of color (Kaeble et al. 2015, p. 2).

Factors contributing to disparate arrest and sentencing rates are complex. Causal factors that may lead to the disproportionate representation of people of color in the criminal justice system are (1) racial differences in offending, (2) bias or discrimination, (3) legislative decisions, and (4) the disparate impact of "race-neutral" policies in law enforcement and case processing (Nellis et al. 2012, p. 5).

Of those, the one factor that infiltrates all and saves actual racial differences in offending is racial bias. The National Institute of Corrections compiled and analyzed 20 years of data on crime and punishment. In a report released in 2014, they concluded that key contributor to disparate rates is racial perceptions of crime (Ghandnoosh and Lewis 2014). Perceptions or biases held by media, researchers, policy makers, and practitioners lead to harsh and biased criminal justice policies, racial differences in crime rates, distinctly different arrest rates and sentences for similar crimes among racial groups, and the infusion of racial bias in all phases and aspects of the criminal process (Frase 2013).

This bias is not explicit. On its face, policy is value-neutral and executed without regard for race or socioeconomic status. Federal and state constitutional law sets forth the rule of law governing the procedures by which authorities investigate, prosecute, and adjudicate crimes. Specific provisions of the Constitution limit police power, guard against unlawful search and seizure and self-incrimination, guarantee due process, and even supply legal representation for those who cannot afford (United States Constitution (n.d.), p. amend. IV, amend. VI).

These protections alone give society the impression that the criminal justice system is fair and inoculated against bias. This perception helps to foster unchecked bias. Formal fairness disguises systemic racism, bias, and unjust rule of law application.

## Data

Racial disparity permeates every stage of the criminal justice system, from arrest to trial to sentencing, and results in overrepresentation of minorities in the system. Though not more likely to commit crime, racial minorities are more likely than whites to be arrested and convicted and are subject to harsher penalties. African-American males are almost six times more likely to be incarcerated than white males and 2.5 times more likely than Hispanic males (Carson 2015, p. 15). When arrested for similar crimes, minorities often face harsher penalties than nonminority defendants (The Sentencing Project 2013).

## Racial Perceptions of Crime

The overwhelming majority of Americans, policy makers, criminal justice practitioners, and the media are white. Studies show that whites overestimate the level of crime participation by minorities and believe in harsher penalties for certain crimes with which they are associated. Thus, it follows that if those who overwhelmingly represent actors with power to influence, develop, and implement criminal justice policy believe that a particular group is more violent and criminal, that group will be unconsciously targeted and punished at disproportionate rates (Nellis et al. 2012).

This overestimation and resulting harsh policies are based on the following:

- Belief in harsher punishments.
- Overestimation of the amount of crime committed by minorities.
- Crimes most often linked with minorities receive greater penalties.
- Arrests and sentencing are subjective and vary based on administrator and perpetrator.
- Media frames crime coverage that often associates crimes with minorities.

### Overestimation/Harsh Penalties

White Americans overestimate the proportion of crime committed by minorities and believe them to be inherently criminal. In a 2010 survey, whites overestimated percentages of crime committed by African-Americans by 20–30%. In addition, implicit bias research shows deep-seated tendencies among them to associate minorities with criminal behavior (Pickett et al. 2012).

While blacks and Hispanics are far more likely than whites to be victims of violent and property crimes, they are less likely to support harsh penalties. White Americans who associate crime with minorities are more likely to support punitive policies than whites with weaker racial associations of crime. Support for the death penalty and laws like three strikes you are out are overwhelmingly supported by white Americans.

### Biased Framing

Racial distortions are persistent in media coverage of crime. The framing of a portrait or painting can affect how the viewer interprets and reacts to the work itself. As a result, artists often take great care in how they present their work, choosing a frame that they hope will help consumers see or react to their work in the way intended. Similarly motivated, media outlets often present or frame a story in order to control the narrative or present facts that help the consumer to digest the issue through the preferred filter.

Biased framing – that does not mesh with actual data – reinforces the public's mistaken beliefs about crime by presenting minorities differently than whites. Racial minorities are often overrepresented as crime suspects, while whites are almost always the victims.

A study in Los Angeles found that although African-Americans made up only 21% of arrests, 37% of the suspects portrayed on the news were black. Only 13% of actual victims of crime, whites, were overrepresented and reported as victims of crimes as high as 43% of the time. Ten percent of victims in police reports were whites who had been victimized by blacks; however, these crimes made up 42% of reported cases. Cases involving a black suspect and white victim were overreported and gave the perception that

whites were perpetual victims of crime at the hands of African-Americans (Dixon and Linz 2000, p. 143).

Media representations of crime shape public opinion. If media overrepresents minorities as perpetrators and whites as victims, this becomes public opinion. This opinion can lead to criminal justice polices tailored to the offending population (e.g., harsher penalties for crimes believed to be committed mostly by the offending population) or in the case of neutral polices may lead to different and often harsher treatment by street-level bureaucrats (police, judges, lawyers, etc.)

Views of the nature of the crime problem and who is responsible for the problem may be shaped by the degree to which specific groups are over- or underrepresented as perpetrators or victims in crime news relative to other groups or their share of criminal involvement or victimization. If media sources overrepresent certain groups as perpetrators, this bolsters racial or gender stereotypes toward those groups. Similarly, overrepresentation of victims of crime to certain groups may promote misleading views of what populations are the most vulnerable to crime or who should fear crime (Bjornstrom and Kaufman 2010, p. 2).

A 2010 study by the National Institutes of Health on racial-ethnic portrayals in television crime news found that African-Americans were overrepresented as perpetrators, while white females were overrepresented as victims. Using a stratified random sample of news reports drawn from local television stations across the United States as well as from broadcasts of news on national networks ABC, CBS, CNN, and NBC study logged and analyzed the range of violent crime news stories and the racial and ethnic compositions.

They found, if a news story is about a crime that fall under the FBI's uniform crime index (murder, robbery, etc.), the odds of mentioning a black perpetrator over a white increased. If the story concerns a white female victim, the likelihood of mentioning the race of the perpetrator lowered, reflecting the reality the whites more often than other groups violate or harm whites (Bjornstrom and Kaufman 2010).

A 2014 Huffington Post article cataloged instances in which black victims of crime were described disparagingly, while white perpetrators of crime were, before discussing the crime, showered with positive accolades (Wing 2014).

This constant drumbeat of portraying blacks as inherently violent, even when they are victims, helps to craft public opinion, which again leads to official or street-level public policy.

Problem identification is vital in agenda setting. Policy makers often rely on think tanks, interest groups, citizens, and the like to identify problems. Media plays a vital role in identifying problems in the community via the stories they report its framing. If it is never reported – framed neutrally or given significant coverage – it may not rise to the problem level with the general public.

Whether acting on their own implicit biases or political pressure, policy makers have used race in the development of policy. Harsh sentencing laws impact all Americans but disproportionately people of color. Through public statements, many have heightened the public's concern about crime and exaggerated associations of crime with racial minorities.

Practitioners also operate with and reinforce racial perceptions of crime. Disparities in police stops, charges levied, defense at trial, and sentencing upon conviction reveal that implicit racial bias has penetrated all corners of the criminal justice system. Policies that are race-neutral on their surface – such as stop-and-frisk and broken window policing – have targeted low-income people of color for increased surveillance and punishment.

Racial perceptions of crime have distorted the criminal justice system.

## Arrest

### Racial Disparity in Police Activity

In 2010 and 2011, African-Americans, 12% of the population made up one-third of all arrests in the United States. Thirty percent of those arrested for property offense, 38% for violent crime, and one-third of drug arrests were African-American (The Sentencing Project 2013, p. 3). Studies

attribute these numbers to two things, socioeconomic conditions in which the majority reside and racial bias.

Without regard to race, in the United States, poorer neighborhoods often experience higher rates of crime than those more affluent. African-Americans constitute a disproportionate share of those living in these poor neighborhoods and thus may commit more crime. Crime is committed, not because they are naturally violent but because of socioeconomic factors (Brown et al. 2005, pp. 153–159). Accounting for the socioeconomic causation, a significant portion of arrest disparity may be attributed to implicit racial bias.

A majority of Americans, regardless of race, associate black Americans with violence, crime, and danger. Law enforcement, a part of that society, must make real-time assessments about the danger of a suspect or observed activity. By subconsciously associating a group of persons based simply on their race as dangerous, criminal, or violent, the way officers perform their jobs is naturally affected.

The effects of racial bias are omnipresent in the areas of initial police interaction, traffic stops, and drug law enforcement.

### Initial Police Interaction

The tendency to view minority as inherently violent affects the way police interact with those citizens. Even when there is no perceived crime in action, the reaction or overreaction to blacks and Hispanics is often noticeably different than their white counterparts.

In a study published in the Journal of Personality and Social Psychology, researchers found that on average young black boys were less likely to be viewed as innocent and were actually deemed over 4 years older than their actual age. The study showed that the perception of the nature of a child is affected by race, and black boys who are not afforded assumed childhood innocence. This presumption may cause an officer or a judge to view the deeds of a nonminority as childish pranks while at the same time, for a similar offense, arresting and charging the menacing black child. The perception of coming danger may cause the practitioner, for the safety of society, to thrust the black child in the criminal justice system while not desiring to ruin a young nonminority's life by giving them a record (Goff 2014).

The year 2014 gave striking examples of the disparity in action or reaction by law enforcement as it relates to the audience in question.

**Bundy vs. Brown: The Tale of Two Protests** In August 2014, an initially nonviolent protest in response to the killing of unarmed teen Michael Brown by Ferguson – MO police – was met with a military-style response. Peaceful protesters were met with officers in tanks and full body armor and armed with tear gas. In the same year, earlier in April, a group of antigovernment ranchers, in support of Cliven Bundy who wanted to protect his right to allow his cattle to graze on federal land that he did not own, aimed assault rifles at federal law enforcement officers. The rancher's supporters in Nevada were met with officers in uniforms who eventually left the area in order to de-escalate the situation. Citizens – the majority of whom were black, exercising their right to peaceful protest – were met with military force. Adult white men, breaking the law, pointed assault rifles at authorities and were not accosted. The responses, though in different states, are a microcosm of the disparate responses communities regularly experience. The responses are common and vary greatly based on race and ethnicity of the participants.

**Excused Behavior** Studies and social media trends show that if you are white, you may be able to open carry a weapon, shoplift, drive drunk, possess drugs, or challenge a police officer – and not suffer the same consequences a black person might.

In December of 2014, #CrimingWhileWhite became Twitter's highest trending topic in the United States and a trending topic worldwide. In response to a New York grand jury declining to indict a white police officer accused of being responsible for the death of Eric Garner, a black man was suspected of illegally selling cigarettes on the sidewalk. The trending topic did not follow the usual deluge of posts detailing racial profiling

and police brutality, but included thousands of tweets by seemingly white users outlining white privilege in interactions with police officers while or after committing a crime. Officers told teenagers in the cars to be safe going home, through a cloud of marijuana smoke. Vandalism was ignored, suspended licenses were excused, and probation for convictions for theft was dismissed because it interfered with drama club events (Dickersin 2014).

### Drug Enforcement

Between 1980 and 2000, the rate of drug arrest for African-Americans rose from 6.5 to 29.1 per capita, while the arrests for white drug offenders increased from 3.5 to 4.6 per capita. The rate of increase did not correspond to an increase in drug activity by either party. On the contrary, in 2012 the National Institute on Drug Abuse published a study surveying drug usage among secondary school students in the United States from 1975 to 2011. The study found that white students were slightly more likely to have abused an illegal substance within the past month than black students. Yet from 1980 to 2010, black youth were arrested for drug crimes at rates more than double those of white youth (The Sentencing Project 2013, p. 4).

In Seattle in 2002, African-Americans constituted 16% of observed drug dealers for the five most dangerous drugs, but 64% of drug dealing arrests for those drugs. The remaining 84% of drug dealers (nonblack) were only arrested 36% of the time (Beckett et al. 2006, pp. 105–106). Similarly in 2005, whites were observed dealing illegal drugs in downtown Seattle 49.5% of the time but constituted 9.3% of the arrests. In the same area, blacks were observed 33.3% of the time and made of 85.3% of those arrested (Beckett 2008, p. 68). The difference can only be equated with practitioners targeting or being more prone to targeting or believing that the darker face is the source of the problem. That darker face gets more attention in the form of surveillance, stops, and arrests.

On January 1, 2014, recreational marijuana sales became legal in Colorado. Though still illegal for those under 21 to possess, adults can legally purchase the drug and do so in large numbers. This legalization did little and seems to have exasperated racial disparity in drug arrests. After its legalization, arrest rates for young blacks and Latinos rose dramatically. Data show that those who overwhelmingly purchase the drug are white, while those targeted for search and arrest continue to be minority.

A Colorado Health Department survey found there was not a huge racial difference in those who smoke the drug. But the marijuana arrest rate for white 10–17-year-olds fell by nearly 10% from 2012 to 2014, while arrest rates for Latino and black youths, respectively, rose more than 20–50% (Reed 2016, pp. 55–71).

### Traffic Stops

Data on traffic stops also demonstrate the influence of racial bias on law enforcement practices and arrest rates. Published in 2011, the US Department of Justice's report on *Contacts between Police and Public* illustrated the difference in how citizens were treated during traffic stops with respect to race. They found that while white, black, and Hispanic drivers were stopped at similar rates nationwide, black drivers were three times as likely to be searched during a stop as white drivers and twice as likely as Hispanic drivers. Additionally, black drivers were twice as likely to be threatened with force for noncompliance as both with white and Hispanic drivers. This data is consistent with research indicating common racial association of black Americans with dangerous or aggressive behavior (Eith and Durose 2011).

Looking inward, in one New Jersey study, racial minorities – with violation of traffic laws identical to whites – made up 15% of drivers on the New Jersey Turnpike, constituted 42% of the stops, and 73% of arrests made by police. Other data showed that whites were less likely to be viewed as suspicious by police – even though they were twice as likely to be carrying illegal drugs as stopped blacks.

The most widely publicized example of racial profiling in recent times is the "stop-and-frisk" tactic employed by the New York Police Department (NYPD). African-Americans and Hispanics

constitute 25% and 29% of New York City's population, respectively. Between 2010 and 2012, 52% of those stopped by the NYPD during "stop and frisk" were black and 32% were Hispanic. Though stopped and frisked at higher rates than whites, blacks and Hispanics were less likely than whites to be caught with weapons or drugs (The Sentencing Project 2013, p. 5).

When questioned on the disparity, the NYPD cited the need for the tactic in "high crime areas." The areas targeted where almost always majority-minority. Interestingly enough data compiled by Dr. Jeffrey Fagan show that even neighborhoods with the lowest crime rates were classified as "high crime areas" when the majority of the population was nonwhite (The Sentencing Project 2013).

This further shows how the racial perceptions of who commits most crime affect who is stopped and searched, searches that may lead to arrests. If all communities were searched at similar rates, the rates of arrest would be dramatically different.

### Racial Disparities in Trials

Arrests are the first step in the criminal justice system. Bias can follow a defendant through the charging, trial, and sentencing phases.

Racial disparities in sentencing begin with prosecutors' decisions on charging. There are many offenses that can be dismissed, charged as misdemeanors or felonies. The exact same offense, depending on the decision of the arresting officer and prosecutor, can result in a trip home with a warning or a felony change. One study found that minority defendants face significantly more severe charges than whites.

Not absolute and applicable to all actors, data simply suggest that implicit racial bias may influence defense counsel, prosecutors, judges, and juries.

### Power of the Prosecutor

The office of the prosecutor is most powerful. Deciding which cases to investigate, suspects to charge, charges to bring, and penalties to pursue is all under the prosecutor's purview.

Several studies of prosecutorial decisions suggest that implicit racial bias does in fact influence prosecutors' decision-making. Since 1976, prosecutors are more likely to get an indictment and request the death penalty for black Americans when the crime is homicide and the victim is white. Furthermore, prosecutors were significantly more likely to upgrade cases to felony murder status in cases in which defendants were black rather than white. This is occurring when statistically blacks and whites are victimized at the same rates. The rates of prosecution are not evenly matched (Ghandnoosh and Lewis 2014, p. 23; The Sentencing Project 2013, p. 9).

Similarly, a study conducted in 1993 in Los Angeles found that 95% of the crack cocaine defendants prosecuted in California state court were black and 100% of the 42 crack cocaine defendants prosecuted in federal court were either black or other racial minorities. Even when the rate of drug use and distribution were not similarly matched (The Sentencing Project 2013, p. 9).

Teenagers when black were six times as likely to be charged as adults, denied bail, or received upgraded charges.

## Racial Disparity in Sentencing

Once minority defendants are convicted, they are likely to be sentenced more harshly than white defendants convicted for similar crimes.

In his 2001 analysis of 77,236 federal cases from 1991 to 1994, for instance, Professor David Mustard found that even when cases were controlled for the severity of the offense, the defendant's prior criminal history, and the specific district court's sentencing tendencies, blacks received sentences 5.5 months longer than whites, and Hispanics received sentences 4.5 months longer (Mustard 2001).

Black and Latino offenders sentenced in state and federal courts face significantly greater odds of incarceration than like white offenders and often receive longer sentences than their white counterparts. The level of disproportionate representation of blacks among prisoners who are

serving life sentences without the possibility of parole is higher than that among parole-eligible prisoners serving life sentences. Of those with life sentences, 28.3% are lack, 56.4% of those have life without parole, and 65.4% of those are for nonviolent offenses (American Civil Liberties Union 2014, p. 2).

### Capital Punishment

Racial disparity is obvious in cases involving the most severe penalty imposed by the US criminal justice system: the death penalty. The United States has executed 1,335 individuals since 1976. In 2013, of the more than 3,000 prisoners awaiting execution, 42% were black (American Civil Liberties Union 2014, p. 5).

Studies have shown that variables affecting the assignment of capital punishment are simple: the race of the perpetrator and the race of the victim. Defendants convicted of the homicide in which the victim is white have a statistically higher chance of being sentenced to death. Half of the murder victims in the United States are white, but 77% of those on death row for murder are there for the murder of that 50%. This implies that the murder of someone white results in the death penalty 77% of the time.

Comparatively, black people also constitute half of murder victims, but only 13% of persons executed since 1976 were convicted of killing black victims. A 1990 Government Accountability Office survey of 28 separate studies found that in 82% of the studies, the race of the victim was shown to influence the likelihood of a defendant receiving the death penalty (U.S. Government Accountability Office 1990). In other words, those convicted of murdering white victims are more likely to be sentenced to death than those convicted of murdering black victims even when the cases were similar.

### The "War on Drugs"

A 2007 report, "A 25-Year Quagmire: The War on Drugs and Its Impact on American Society" assessed the impact of the "war" on the criminal justice system and American communities. Beginning in 1982, the onset of the "war," the number of Americans incarcerated for drug offenses grew from around 40, 000 to 500,000. In addition, sentencing laws changed and mandatory minimum sentencing was introduced. This kept drug offenders in prison for longer periods of time. Sentences that once averaged 2 years grew to a mandatory minimum of 5–40 years (Mauer and King 2007).

Data demonstrate that the War on Drugs has been waged in racially disparate ways, and in turn, generations of African-American families were devastated. From 1999 to 2005, African-American constituted roughly 13% of drug users on average but 36% of those arrested and 46% of those convicted for drug offenses (U.S. Sentencing Commission 2012).

While the War on Drugs creates racial disparity at every phase of the criminal justice process, the most glaring disparity came in the form of sentencing laws. Not value-neutral, the development of the sentencing policy was clearly racially biased.

The laws to combat drug use were centered on the crack cocaine and other drugs most often found in black communities. The same focus was not put on drugs equally as harmful and more readily available and used by whites. For more than two decades, the ratio of the amount of powder cocaine needed to trigger the same sentence as an amount of crack cocaine was 100:1 – even though crack and powder cocaine are chemically identical. Black Americans sold and used crack at higher rates, while whites were found to be the primary users and distributors of powder cocaine (American Civil Liberties Union 2014, p. 5).

African-Americans constituted 80% of those sentenced under federal drug laws each year and received impossibly long sentences. Minor offenses were now subject to long prison terms. Bystanders of a nearby drug deal were often arrested and sentenced to 5 or 20 years in federal prison for being in the vicinity of a drug deal. Possession of small amounts of drugs triggered 40-year mandatory sentencing not subject to prosecution or judicial discretion. On the contrary, many whites were sentenced to rehabilitation or

given lower sentences. Even when the violation was the same, disparity in sentencing laws lead to harsher sentences for black defendants than those of their white or Latino counterparts convicted (American Civil Liberties Union 2014, p. 5).

Ushered in to thwart drug crime, the laws were disproportionately applied to those in the black community, without respect to increased instance of perpetration.

The War on Drugs is a perfect illustration of the way the effects of racial bias become amplified as defendants move through the criminal justice system: bias causes law enforcement officers to stop, search, and arrest racial minorities at higher rates; minority defendants are charged more harshly or are represented by ineffective defense counsel; they are more likely to be convicted by juries and trial judges on similar evidence; and they are likely to receive harsher penalties for similar crimes. Each step in the process adds to the racial gap in the criminal justice system.

## Conclusion

The data are clear, and bias influences social policy on arrest and sentencing. Racial misperceptions of crime, socioeconomic conditions, and inherent bias affect how persons of color are treated in the criminal justice system. From initial interactions, possible arrests through charging and sentencing minorities are treated more harshly and ultimately overrepresented in the criminal justice system.

Two decades of research establishes that skewed racial perceptions of crime – particularly, white Americans' strong associations of crime with racial minorities – have bolstered harsh and biased criminal justice policies. The policies, which do not target criminals fairly, can in the end undermine public safety.

Although blacks and Latinos together comprise just 30% of the general population, they account for 58% of the prison population. Though they are not predisposed or more likely to commit crime, they are stopped, searched, arrested, or treated harshly by practitioners at rates significantly higher than nonminorities. The bias that leads to arrest permeates through the charging and sentencing phases of the criminal justice system.

For similar crimes, they usually face harsher charges. With similar evidence, minorities are convicted more often and given stiffer sentences than their white counterparts.

Race is a key ingredient in the development and administration of policies that govern arrest and sentencing. The rule of law, which should be value-neutral, in this case is laden with racial bias.

# Railway Labor Act

Steven E. Abraham
State University of New York at Oswego, Oswego, NY, USA

## Synonyms

Railway Labor Legislation; Railway Labor Law; RLA

## Citation

45 USC §151 et seq.

## Definition

The Law governing private sector labor (union management) relations in the US railway and airline industries.

## Introduction

The Railway Labor Act (the RLA or the Act) is the law governing union management relations in the railway and airline industries. Its five purposes are stated in Section 151a:

R

To avoid any interruption to commerce
To ensure an unhindered right of employees to join a labor union (added as part of the 1934 amendments)
To provide complete independence of organization by both parties to carry out the purposes of the RLA
To assist in the prompt and orderly settlement of disputes covering rates of pay, work rules, or working conditions
To assist in the prompt and orderly settlement of disputes growing out of grievances or out of the interpretation or application of existing contracts covering the rates of pay, work rules, or working conditions

While the primary purpose of the National Labor Relations Act is to assist employees in their rights to join labor unions, be protected by labor unions, and engage in "concerted activities for purposes of mutual aid and protection," the primary purpose of the Railway Labor Act is to prevent labor disputes from interfering with the smooth operation of the railway and airline industries.

This entry will discuss labor law in the United States in the railway industry prior to the passage of the RLA and the passage of the RLA itself. This will be followed by a discussion of the Act's coverage, representation of a firm's employees under Act, negotiation of new collective bargaining agreements under the RLA ("major disputes"), the resolution of existing disputes under the Act ("minor disputes"), and concerted activity under the RLA.

## Labor Law in the Railway Industry Prior to the RLA

The railway industry always has been unique when it comes to the regulation of labor relations. Undoubtedly, this is due to the history of unionism and labor unrest within the industry. The Brotherhood of Locomotive Engineers was formed back in 1863 in Detroit, and a number of other unions representing railway workers were formed before the turn of the nineteenth century. The year 1877 saw the "Great strike of 1877," 1886 saw the Great Southwest Railroad Strike of 1886, and in 1894, the Pullman strike was waged by the American Railway Union, an amalgamated union of railway workers in different crafts founded by Eugene V. Debs. Each of these strikes resulted in a great many casualties and federal troops had to intervention.

As a result of the labor relations strife in the indsutry, the Arbitration Act was passed in 1888 with the intent of providing for the peaceful settlement of disputes between railways and railway unions. Further, several states had passed laws dealing with labor relations even prior to that. The Arbitration Act proved not to be effective, however, and as a result, Congress passed the Erdman Act in 1898, the Newlands Act in 1913, and the Transportation Act in 1920. Interestingly, none of these laws guaranteed employees the right to unionize and/or provided protections for unions; rather, their goal was maintenance of labor peace in the railway industry. They all provided for some type of mediation and/or arbitration to deal with labor disputes in the railway industry.

## Passage of the Railway Labor Act

The four laws just mentioned all proved to be unsuccessful at maintaining peace in the railway industry and as a result, both of the major political parties in the United States called for new legislation dealing with labor relations in the railway industry to be enacted in the period leading up to the 1924 elections. In fact, several bills were introduced into Congress in 1924. While none of these bills was passed, much that was contained in them wound up in the bill that would become the RLA in 1926. Then, in 1925, a committee of railway executives and union representatives met to draft a bill that eventually would become the Railway Labor Act. As a result of the meetings held by this committee, bills were introduced in both houses on January 8, 1926. In the Senate, hearings were held on S. 2306 in the Committee on Interstate Commerce and a favorable report was

issued at the end of February. In the House, H.R. 7180 was introduced and referred to the Committee on Interstate and Foreign Commerce. Hearings were held in January and February but the bill was never reported. Instead, H.R. 9643 was introduced into the House on February 17 and reported favorably 2 days later. That bill passed the House on March 1 and was referred to the Senate. The Senate debated H.R. 9643 starting on April 22 and into the beginning of May and it passed the Senate on May 11. The Railway Labor Act was signed by President Coolidge on May 20, 1926.

It is important to note that even though the Act as it read in 1926 provided for "complete independence of organization by both parties," nothing else in the Act was devoted to the organizing rights of employees or penalties that would be imposed on employers for interfering with those rights. Rather, the rest of the Act dealt solely with disputes concerning the negotiation of new contracts ("major disputes") and disputes concerning the interpretation of existing contracts ("minor disputes").

As it turned out, unions were not happy with the Railway Labor Act as originally passed. And when Franklin D. Roosevelt was elected in 1932, union leaders were sanguine about the possibility that legislation would be passed to strengthen the organizing rights of independent unions and employees. So in late 1932, railway union leaders met to draw up new labor legislation designed to strengthen protections for unions. In fact, they even met with Transportation Coordinator Joseph B. Eastman in the hopes that they would be able to convince the president to support legislation designed to strengthen the organizing/collective bargaining rights of unions and employees. Then, in 1934, bills were introduced in both houses. In the House, the bill H.R. 7650 was introduced in early February and debated throughout February and March. In the Senate, S. 3266 was introduced on March 28, debate was held through April in the Senate Committee on Interstate Commerce and and the bill was passed in May of that year. In the House, H.R. 9861 was introduced on June 4 and passed on June 18. Subsequently, H.R. 9861 was substituted for S. 3226, that Bill was passed by both houses at the end of June and it was signed by the president on June 21, 1934.

The 1934 amendments to the Act had a very different focus from the law that was passed in 1926. While there were some changes in the procedures for settling disputes that had been enacted in 1926, most of the changes in the 1934 amendments focused on organizing rights of employees. For example, an additional sentence in Section 2 stated "representatives of employees for the purposes of this Act need not be persons in the employ of the carrier...." This addition was designed to make it clear that employees could choose to be represented by independent labor organizations rather than by company unions. Another new section of the Act made it clear that employees had the right to organize and bargain collectively through representatives of their own choosing and further stated that no employer had any right to deny its employees' right to "join, organize or assist" the labor organization of their choice. Further, the 1934 amendments prohibited employers from engaging in a number of acts that would constitute "interference, influence or coercion" of employees and affirmatively required employers to "treat" with the employees' chosen representatives. This was enhanced by providing penalties that would be imposed on employers for violation of employees' organizing rights. And finally, the 1934 amendments enumerated an election procedure that would be used if there was any dispute about which labor organization represented the employees employed by a carrier. This included establishing the National Mediation Board (NMB) as an independent agency to oversee representation elections under the Act.

The Railway Labor Act was amended for the final time in 1936, as airlines were added to the Act's jurisdiction. There have been no major amendments since.

## The Act Itself

### Coverage

As indicated above, the Railway Labor Act applies to employers in the railway and airline

industries. An organization cannot be subject to both the RLA and the NLRA and generally, the NLRB defers to the NMB when it comes to questions of jurisdiction; if the NMB determines that an entity falls within the RLA's coverage, the NLRB will not assert jurisdiction.

While for the most part, the issue of which employers fall under the Act's jurisdiction has not been overly controversial, a fairly interesting dispute has arisen between United Parcel Service and FedEx. Under current interpretations (as of 2017), FedEx has been determined to be covered by the RLA while UPS is covered by the NLRA. Since organizing employees generally tends to be easier under the NLRA than the RLA, UPS's employees are unionized whereas most of FedEx's are not and UPS executives object to this situation. In fact, in 2009, a clause was introduced into FAA legislation that would have brought FedEx under the jurisdiction of the NLRA and this one particular clause lead Tennessee's two senators to vote against the bill. But after much lobbying, this clause was removed from the bill, so FedEx's ground employees remain covered under the RLA.

### Representation of a Firm's Employees

As stated above, one of the five general purposes of the RLA is "to forbid any limitation upon freedom of association among employees or any denial, as a condition of employment or otherwise, of the right of employees to join a labor organization." Again, this purpose was added to the law as part of the 1934 amendments. Section 152 ninth of the Act provides that the National Mediation Board ("NMB") is responsible for determining whether the employees of a railway or airline shall be represented by a labor organization.

Under the RLA, representation of employees is determined on a "system-wide" (company-wide) basis. In other words, in order for a labor union to be certified as the representative of a particular railway's or airline's employees, the union must receive the support of the majority of employees in a particular craft or class among the entire organization. Under the National Labor Relations Act, union organizing is usually done on a more localized basis, and a given union may consist of more than one craft or class (i.e., occupation). For example, the employees of one particular Walmart store would vote on whether or not they wish to be represented by a labor union under the NLRA, but the employees in a particular craft of class of JetBlue throughout the nation would vote to determine whether they wished to be represented by a given union under the RLA. The system-wide organizing under the RLA makes it much more difficult for a union to organize a group of employees.

Once a "substantial number" of employees in a particular craft or class show their support for being represented by a particular labor organization, the NMB will conduct an election. Effective 2012, the RLA was amended to provide that at least 50% of the employees in a given craft or class must demonstrate their interest in being represented by a particular labor organization, or else the NMB is prohibited from conducting an election. Under the NLRA on the other hand, only 30% of the employees in a "bargaining unit" need demonstrate interest in being represented by a union in order for the NLRB to hold an election.

Beginning in 2002, the NMB instituted several changes in the way elections are conducted under the RLA. In 2002, telephone voting was instituted and in 2007, Internet voting was instituted. But the most important change occurred in 2010. Starting then, the NMB would certify a union as representative of a bargaining unit if a majority of those voting supported representation. Under the rule prior to 2010, a union was required to acquire a majority of all employees in a bargaining unit – whether or not they voted – in order to be certified. In other words, nonvoters automatically had counted as "no votes" prior to 2010. After 2010, nonvoters would have no impact on the outcome. This makes it much more likely that unions will win elections.

One thing worthy of note regarding elections under the RLA is that while the NMB oversees the election process, it does not have the authority to remedy any violations of the Act. While the NLRB has the authority to find that a party has violated the NLRA and order either party to remedy such violations, the NMB does not have the

same jurisdiction. If either party feels that the other has violated the RLA's election procedures, that party must resort to the courts for a remedy.

Finally, the RLA does not have specific procedures for decertifying a union. To remove a union's authority, a majority of the workers must sign cards that authorize a fellow employee to act as their "representative." The employee then files a form claiming a "representational dispute" that calls for an election to decide how the employees should be represented (including the option of no representation). A union will be decertified when less than 50% of voting employees cast ballots for the incumbent union. In sum, it is probably more difficult for a union to organize employees under the RLA than under the NLRA, but it is also probably more difficult for employees to remove a union's representation rights under the RLA.

### Negotiation of Collective Bargaining Agreements: "Major Disputes"

The negotiation of collective bargaining agreements under the RLA are referred to as "major disputes" according to the Act's terminology. The RLA has a detailed procedure for how such disputes are resolved. Section 2, First of the Act requires the employer and the representative of the employees to "exert every reasonable effort to make and maintain agreements" concerning "rates of pay, rules and working conditions." Interestingly, there has been relatively little litigation over what subjects are in encompassed by that term. An interesting thing about collective bargaining agreements under the RLA is that they generally do not expire. Rather, the terms and conditions of a collective bargaining agreement negotiated by parties under the Act continue indefinitely until the party wishing to modify the agreement serves what is known as a "Section 6 notice" on the other party. Once the Section 6 notice has been served, neither party can change the status quo until all of the Act's procedures have been exhausted.

Once either party serves a timely notice to negotiate an initial collective bargaining agreement or reopen an existing agreement, the RLA requires a very structured process. While bargaining is taking place, either party can apply to the NMB for mediation services at any time during the bargaining process. While it is rare that the party not requesting mediation will object, the courts actually have jurisdiction to order mediation if a party does not agree. Then, once mediation begins, the parties bargain in the presence of a mediator. Further, the parties must continue bargaining until the mediator releases them; neither party can unilaterally withdraw from bargaining once the mediation process has begun.

If the NMB determines that further mediation efforts will not be successful, it will offer binding interest arbitration to the parties. If either side objects the offer of arbitration (one side usually objects), the NMB will send a notice to each party terminating its services. This notice triggers another 30 day "cooling off period," during which the parties must continue to maintain the status quo. Only after all of these steps have taken place may the parties resort to self-help (strikes and lockouts). Under Section 10 of the RLA, however, if the NMB determines that the dispute presents a substantial threat to interstate commerce, it may recommend that the president create an Emergency Board. Emergency Boards have not occurred frequently in the recent past, however.

### Disputes Involving Existing Bargaining Agreements: "Minor Disputes"

Disputes concerning the meaning or interpretation of a term included in an existing collective bargaining agreement are known as "minor disputes." Such disputes are settled by mandatory arbitration under the Act, but the procedure for settling these disputes is slightly different in the railway and labor industries. In the railway industry, the Act created an agency known as the National Railroad Adjustment Board (NRAB). The NRAB is a federally funded arbitration service for the railway industry. The NRAB often is very far behind in resolving cases due to budgetary constraints, etc. But the Act authorizes the parties to create alternative arbitration mechanisms; these alternative boards are known as "Public Law Boards." When the RLA was amended to include airlines, however, no arbitration board similar to the NRAB was created.

While Congress stated that such a board might be created in the future, one has never been established. Instead, air carriers and the unions representing their employees create their own private arbitration mechanisms known as "System Boards of Adjustment."

### Strikes and Other Concerted Activity

Unlike the NLRA, the RLA does not specifically authorize employees to engage in "concerted activity." Therefore, employees subject to the RLA's jurisdiction may be disciplined by an employer for conduct that arguably would be protected by the NLRA as "concerted activity for mutual aid and protection."

As far as strikes are concerned, there is a difference between major and minor disputes discussed above. As indicated, in a major dispute, neither party may resort to self-help (e.g., strikes, boycotts, lockouts) of any form prior to the expiration of the status quo. Thus, a carrier may obtain an injunction to stop a union from striking before the expiration of the status quo. Once the status quo has been reached, however, there are virtually no limits on the form of self-help that a union may utilize. Thus, such things as slowdowns, "quickie strikes," etc., are not prohibited by the RLA. Further, unlike the NLRA, the RLA contains no prohibition against a union from engaging in a secondary boycott. In a secondary boycott, a union utilizes concerted activity (e.g., a boycott) against a neutral employer with whom it does not have a dispute as a way to put indirect pressure on a primary employer, with whom the union does have a dispute.

In the case of minor disputes, however, strikes and other forms of self-help are totally prohibited. Therefore, if a union goes on strike to protest an employer's actions in the case of a minor dispute, that strike can be enjoined.

## Conclusion

As stated above, the Railway Labor Act is the law governing labor relations in the railway and labor industries. The major goal of the law is to ensure that those industries are not disrupted by labor relations strife. In fact, when the Act was originally passed in 1926, there was virtually nothing on employees' right to unionize under the Act. And while the Act's amendments in 1934 provided more substance to employees' rights to unionize, the Act's main focus remains the maintenance of labors relations peace in those two industries.

# Rape as Social Policy

Lisa Sharlach
Department of Government and Public Administration, University of Alabama, Birmingham, AL, USA

## Synonyms

Sexual violence as social policy

## Definition

Governmental actions, laws, and policies encouraging or overlooking rape have a direct and deleterious impact on the well-being of citizens, especially those of less powerful social groups.

## Introduction

No government today boasts of rape as official policy; in fact, all states criminalize it.

However, rape has been and continues to be a tactic of social policy during conflicts ranging from genocide and civil war to counterinsurgency operations against ideological or identity-based resistance movements. During armed conflict,

state agents and their affiliates, not just rebels, are likely to be among rape's perpetrators. Moreover, rape has served as a political weapon not only in war but also in the absence of armed conflict. Even civilian-perpetrated rape in peacetime can be social policy when there is evidence that state institutions demonstrate a consistent bias in favor of the rapist. In a just polity, the state, acting on behalf of the victim, will try to punish the perpetrator of a sexual offense. In societies in which the legal system reflects social group biases, including against the female sex, a victim who tries to win legal redress for sexual violence may instead find herself trivialized, ignored, or, under some codes, prosecuted. Such encounters with a prejudicial justice system are what survivors may dub "the second rape."

## Definitions of Rape

What constitutes rape varies widely among legal codes. In some, the term "rape" pertains exclusively to forced penile-vaginal penetration and is legally impossible within a marriage. International law, however, tends to include under the rubric of rape a wider range of nonconsensual sexual acts, including homosexual or heterosexual sodomy, object rape, or sexual relations with someone incapable of giving consent. To encompass these important but sometimes overlooked sexual violations, most scholars refer to "sexual violence," even when the specific act they are documenting is rape. It should be noted that males, females, and transgenders are found among both rapists and raped, although this article features masculine pronouns for the perpetrators and feminine ones for the victims because heterosexual rape by a man is the most common form of the crime. "State rape" is a term used in this entry to refer to situations in which rapists are agents of a government (or quasi-government) and are acting in their official capacity. A soldier, police officer, or other government agent who rapes is most probably seeking self-gratification; this does not, however, mean that his crime is entirely opportunistic. Any act of violence may have multiple motivations.

## State Rape Warfare

Although rape has been an instrument of foreign policy since antiquity, the discussion here is limited to domestic, rather than international, politics. Genocide is a social policy, albeit an extreme one, and rape has been a persistent element of it. In the twentieth century, the annihilation attempts against the Herero and Nama of German South-West Africa, the Armenians, the European Jews, and the Tutsi in Rwanda were all incontrovertibly genocides in which, to varying degrees, sexualized violence was one tactic. Rape was also a strategy of what was likely genocide in Bangladesh, Guatemala, Bosnia-Herzegovina, Iraq, and Sudan (although experts disagree as to whether the violence in these case studies meets the stringent legal conditions necessary to be deemed genocidal). Soldiers and militia raped before executing their victims; they attempted to dilute an ethnic community's bloodline by forcibly impregnating its women; and they intended for the mass rapes to traumatize surviving members of the community. Rape was not only a consequence but a key component of these episodes of genocide and mass slaughter.

Genocide is rare, but state rape in civil war is not. Security forces may hold an unofficial norm of raping to intimidate or silence opponents or their family members; rape and attacks on genitals or women's breasts during interrogation of suspected rebels are common. Additionally, political actors – especially police, soldiers, intelligence officers, and pro-government militia – may sporadically rape women of disadvantaged social groups as a form of political terror or acts of political violence intended to hurt civilians indiscriminately. The victims and their families may not themselves be subversives; they may fall target simply because of their ethno-national, religious, class, or caste identities. The political function of these rapes is to display state power and to maintain the subordination of women of the disadvantaged group.

State rape warfare has plagued many ethnic conflicts. Examples from the last three decades include, but are not limited to, the former Yugoslavia, Indonesia, Sri Lanka, Liberia and Sierra

Leone, Sudan, Burundi, and the Democratic Republic of the Congo. In 2010, Margot Wallström, the UN special representative on Sexual Violence in Conflict, referred to the Democratic Republic of the Congo as the world's "rape capital." She blamed both rebels and the army. The most current example of large-scale state rape warfare in an ethnic conflict is South Sudan. Factions of the Sudan People's Liberation Army are attempting to overthrow President Salva Kiir for reasons that include his overly centralized and authoritarian style of governance. Nonetheless, the conflict also has roots in long-standing ethnic rivalries between the Dinka and Nuer. A 2016 report from the United Nations High Commissioner for Human Rights blamed "all parties," but especially the state and affiliated youth militia, for sexual violence, which it concluded that "widespread or systematic, committed with impunity and perpetrated to instil [sic] terror within civilian communities perceived to support an opposing side" (United Nations Human Rights Office 2016, p. 38).

When national troops patrol or occupy a zone in which there is ethnic rebellion, state rape warfare may become a danger. For example, the Women's League of Burma has repeatedly reported over the last 15 years that military personnel patrolling the ethnic minority regions, such as Kachin State and Northern Shan State, rape with impunity: "Sexual violence is used as a tool by the Burmese military to demoralize and destroy ethnic communities. Army officers are not only passively complicit in these sexual crimes but often perpetrators themselves" (Women's League of Burma 2014, p. 1). A similar pattern of rape warfare has occurred in Nigeria's Niger Delta. A large police and military presence is in place to protect the infrastructure of the oil industry, to thwart possible kidnapping of oil workers, and to combat secessionist militia. However, girls and women in restive locations in the Niger Delta, such as Ogoniland, testify that federal agents have raped them in retaliation for their communities' demands for environmental protection and access to oil resources (Lenning and Brightman 2008). Human rights monitors noted a decade ago that federal security forces in the Niger Delta "have used rape to humiliate and dehumanize women and their communities; to coerce them into divulging information about the whereabouts of certain individuals; to intimidate the community into submission; or as a collective punishment" (Amnesty International 2006).

Religious differences may underlie rape warfare, despite the fact that no major world religion condones rape. Timor-Leste (East Timor), for example, is ethnically heterogeneous but overwhelmingly Catholic. Indonesia, which occupied East Timor for the last quarter of the twentieth century, is predominantly Muslim. The Timor-Leste Commission for Reception, Truth, and Reconciliation noted in its final report that it had collected testimony of over 800 instances of sexual violence perpetrated by Indonesian soldiers and the affiliated militia. Some of the victims were raped during torture or interrogation because they were or were associated with members of the Resistance; some were forced into sexual slavery in the barracks; some were violated (and some later killed) during military operations against their communities; some were raped in 1999 during mass deportation to camps in West Timor. The Commission concluded, "The practice of capturing, raping and torturing women was conducted openly, without fear of any form of sanction by senior military officers and other military personnel, civilian officials, police officers, teachers and members of the auxiliary groups…" (Commission for Reception Truth and Reconciliation Timor-Leste (CAVR) 2005, p. 120).

Even in this century, sexual violence in religiously motivated unrest has been tacitly permitted, covered up, or even perpetrated by state security personnel. Rape has been a central component of communal (ethno-religious) strife in India, such as during the clashes between Hindus and Muslims in 2002 in the state of Gujarat and in 2013 in the Muzaffarnagar district of the state of Uttar Pradesh. Likewise, in the Central African Republic in 2013, a Muslim coalition, the Seleka, seized power and perpetrated much destruction

and violence, including rape, particularly against Christians. Later, in retaliation, Christians and animists, known as anti-balaka, attacked not only the Seleka but also Muslim civilians in general. Rape of Muslims, and also those Christians who associated with them, ensued. Finally, in 2014 in Northern Iraq, so-called Islamic State fighters captured women and girls among the Yazidi, a Kurdish religious minority, for rape and sexual slavery. Some kidnappers have given theologically dubious religious justification for raping non-Muslims. The extreme forms of violence, including sexual, against religious minorities serve the purpose of purging all non-Sunni Muslims from the zones claimed by Islamic State.

Rape may be a weapon of terror in conflicts based on socioeconomic class divides as well. In Democratic Kampuchea, the official name of Cambodia during rule by the Khmer Rouge in the mid-1970s, rape was a serious crime for which the government would and did inflict the death penalty. Nonetheless, at the start of the revolution, some Khmer Rouge cadres raped and sexually mutilated women from what had been the elite classes before killing them. As the revolution progressed, almost anyone could become a victim of torture, murder, or rape at any time.

Finally, rape may be a social policy in a conflict based on ideology. Haiti, Zimbabwe, and Guinea provide only a handful of examples of rape as a strategy of partisan warfare by a dominant political group. In Haiti in 1991, the military junta's backlash against ousted President Jean-Bertrand Aristide's followers included rape. After Zimbabwe's 2008 election, war veterans, Central Intelligence Organization agents, and pro-Mugabe militia gang-raped female supporters of the opposition Movement for Democratic Change (MDC). In the following year, state security forces in Guinea raped dozens of women (and killed at least four of these) when they raided an opposition rally in the capital, Conakry. In both Zimbabwe and Guinea, ethnic identities mattered, but party affiliation was the most salient factor in the violence.

## Rape as Social Control

Perpetrating rape as social policy needs not be limited only to those on a government's payroll. In the United States as well as most other countries, a civilian rapist's target is more often than not someone of his own ethnic group. Rapists tend to prey on those who are nearby, and these are usually one's own kind. However, a smaller subset of criminal rape is interethnic. The social group identity of the victim may affect the treatment of the case; rape survivors from marginalized social or political groups may have unequal access to justice.

Laws and policies on rape that are overtly discriminatory toward the female sex are found around the world. In Peru until 1997, a convicted rapist could be exonerated if he married his victim. Until 2002, although a convicted rapist in a South African prison would receive free HIV/AIDS treatment if required, the South African government refused to provide lifesaving postexposure prophylaxis against HIV for rape survivors. Until recently in South Africa and Zimbabwe, the "cautionary rule" held that women crying rape belong within a special category of witnesses whose testimonies tend to be fraudulent.

Pakistan is an example of state with laws and policies that are so gender discriminatory that it is difficult to convict anyone of rape. In Pakistan, there is complicated legal system with parallel layers. Rape cases can go to the local village council, on which only men sit (one all-female council formed a few years ago in Pakistan's Swat Valley, but it has only advisory powers). The all-male councils not only tend to favor their own sex in rape cases but also may order forced marriage and even rape of girls and women to settle scores among the community's men. The gender insensitivity of these councils shot to international attention in 2002 when one in the Punjab province ordered the gang rape by up to 14 men of Mukhtaran Bibi (now known as Mai). The gang rape of the 30-year-old divorcee was the council's official sentence for an alleged offense by her

younger brother. What was unusual about the case was less the terms of the sentence than that the victim, a tribal woman, contested it. The legal proceedings in Mai's rape case took 9 years to wind through various levels and branches of Pakistan's parallel legal systems. The outcome was that one of the accused got a life sentence and all others won acquittals.

Pursuing justice for rape in the formal legal system is likewise daunting for women. The *Hudood Ordinance*, promulgated during the "Islamicization" of Pakistan in 1979, holds that for a man to be convicted of rape, the court must hear the testimony of four honorable Muslim male witnesses to the act of penetration. A less draconian civil law on rape also now exists, but the choice of which legal code to use in a rape case is a matter of judicial discretion. In Pakistan's official legal system, only in the cities of Hyderabad and Karachi do female medical-legal examiners themselves present the evidence from the physical examination of a rape victim to the court. All other jurisdictions require men to present evidence from the gynecological exam at trial, even if collected by their female colleagues. According to legislator Syeda Sughra Imam's 2014 testimony to the Senate Standing Committee on Law and Justice, the conviction rate for the Ministry of the Interior's registered cases of rape in all of Pakistan over the previous 5 years had been close to zero (Ebrahim 2014).

Even when and where the law and policy are nondiscriminatory, the way they are implemented by the agents of the state – law enforcement, the justice system, and official medical personnel – may remain prejudicial toward women. Adherence to commonly held rape myths – such as that wearing a short skirt, being out alone at night, or having previous sexual experience meant the victim was "asking for it" – may taint how government personnel approach the parties involved in a complaint of rape. Even in Scandinavia, one of the most favorable regions of the world for women's legal and political rights, police "close" most of the cases of women who complain to them of rape. Police and prosecutors who adhere to rape myths may disbelieve a woman's cry of rape. They point to provocative attire, or willingness to go on a date with a man, as implied consent to sex with him. Once closed, prosecution, much less conviction, of a rape case cannot happen.

State agents, in addition to having gender biases, may hold ethno-racial prejudices which result in conviction and sentencing disparities. Pakistan again serves as an example. Every year, Muslim men abduct some 1000 girls from religious minority backgrounds, convert them to Islam, and force them to marry. Approximately two-thirds of the girls are from Christian families and the remainder mostly from Hindu ones. When the girl's parents go to the police to file charges of abduction or rape, some find that police are unwilling to even register their complaint, especially if it is against someone powerful. The abductor, who may have married the girl himself or may have wed her to someone else, then files charges against the girl's parents. He claims that they are willfully harassing their daughter simply because they oppose her voluntary religious conversion and her choice of husband. Court personnel of both low and high rank tend to demonstrate a bias on behalf of the majority religious community; they may register the girl's statements while she remains captive "without further inquiry into the attendant circumstances, such as whether the victim is acting under duress by her abductors" (Ansari 2014, p. 24).

Laws themselves neither stop nor cause rape. Blatant and widespread lack of enforcement of rape laws, however, especially when the rapist is of a higher-status social group than the victim, is problematic because it creates a culture of impunity for sexual violence. In such a climate, anyone who feels like raping someone from a social outgroup faces little disincentive. One group in particular that suffers from much sexual violence is lower-caste women in India ("Dalits" or, officially, "scheduled castes"). Moreover, Dalit women are subjected to especially degrading forms of sexual violence, such as prostitution, branding, unclothed parading, dismemberment, and scatological acts. Discrimination on the basis of caste is banned by India's constitution, and special laws protect the scheduled castes from "atrocities." Despite these legal protections,

however, the reality is that rapists of Dalit women have much better chances of getting away with their crime than those who rape higher-status women. In India, the overall conviction rate for rape of a woman is 25%, but for Dalit women, that rate drops to less than 2% (Babar 2016, p. 82). Women's groups documented the mass rape that took place during caste riots in India from 1978 to 1988, but the government convicted no one. Even today, it is not uncommon for Dalit women who demand political rights to encounter often lethal violence, sexual, and otherwise. In fact, national statistics indicates that such attacks are increasing. Many Dalit women dare not to file a complaint after violation:

> The brahminical patriarchal discourse of 'honour' and fear of further dominant caste reprisals, moreover, influences Dalit women, their families and their communities, not to seek justice where violence takes place. Impunity for violence, therefore, is an intrinsic factor in the maintenance of the caste system and caste-and-gender based norms circumscribing Dalit women's fundamental rights and freedoms. (Kumari 2016, p. 211)

Even if a Dalit chooses to press charges for rape, criminal justice personnel or the local village councils may be unwilling to prosecute an alleged perpetrator who is of a higher caste than his victim.

## Conclusion

Although different polities define rape in somewhat different ways, it may be found in all social sectors across all societies. It is most common in war, where even in modern times it has been a tactic of genocide, torture, and terror. Rape has surfaced in recent armed conflicts based on ethnicity, religion, caste, social class, and political affiliation. Rape may also be a method of maintaining control over lower-status groups, even in times of peace. A polity's level of state rape depends on the extent to which a state is a gendered and racialized entity, rather than a neutral arena for intergroup negotiation. Where masculine and/or ethno-religious biases are deeply entrenched in law, perpetrators of sexual offenses who belong to society's dominant groups may be able to rape with impunity. Not only rape but also rape law and policy can serve as weapons of repression of targeted social categories, such as women, Dalits, ethno-religious out-groups, or political opposition members. Although the purported social contract between the state and citizen has its central premise protection from violence such as rape, the examples provided herein from around the globe demonstrate that the state, rather than being a citizen's protector, may well be one's sexual predator.

# Rational Model of Decision-Making

Francis C. Uzonwanne
College of Management and Social Science, Department of Psychology, Redeemer's University, Ede, Osun State, Nigeria

## Synonyms

Decision-making models; Leadership decision making; Rational decisions; Rational planning model

## Definition

Being the opposite of intuitive decision making, rational model of decision making is a model where individuals use facts and information, analysis, and a step-by-step procedure to come to a decision. The rational model of decision making is a more advanced type of decision-making model.

## Introduction

Decision making is what hominids do everyday. From the moment humans open their eyes in the morning, they start making decisions about whether to snooze the alarm or just go ahead and get up. All through the day, decisions are made continuously until the decision is made to close their eyes again. Decision making therefore is what makes the human element alive and functional while deciding the world around them and ultimately individual personal fates. Decision making almost always involves choices. In a world full of choices, the individual personality is constantly arraigned with options which can be as basic as what to wear out for the day or what to have for dinner to decisions about what policies would have the best intended outcome toward national economic progress. The business dictionary defines decision making as "the thought process of selecting a logical choice from the available options." (Decision Making n.d.). styles are therefore the learned, habitual response pattern exhibited by an individual, when confronted by a decision situation (Scott and Bruce 1995). Scott and Bruce (1995) proposed four different types of decision-making models: (a) rational decision-making style, which is characterized by a thorough research for and logical evaluation of alternatives; (b) intuitive decision-making style, which is characterized by a reliance on hunches; (c) dependent decision-making style, which is characterized by a search for advice and direction from others; and (d) avoidant decision-making style, which is characterized by attempts to avoid making decisions altogether (Scott and Bruce 1995). Rational decision making is defined and discussed along with characteristic components like intuitive decision making. A model of rational decision making is provided, and some suppositions about rational decision making are also discussed.

## What Is Rational Decision Making?

While decision-making models like the intuitive and dependent or even the avoidant decision-making style may be seen as basic and primary in the sense that these are used more often on a daily basis and rely mostly on predisposition, the rational model of decision making is a more advanced type of decision-making model. Scott and Bruce (1995) lay particular emphasis on the characteristics of thorough research and logical evaluation as it concerns rational decision making. Most people will not go into thorough research concerning what route to take to work

on a busy day in a crowded city or on what choice to make out of the several options on a dinner menu; intuition would probably take care of that. Intuition, most often, does not require reasoning or logic. Instincts are the basic driving factor for the use of intuition in this model. Logical evaluation involves the process of gathering facts and utilizing logic to organize and analyze these facts in such a way that they aid accurate or near accurate decision making. According to Oliveira (2007), rationality has been defined as the "compatibility between choice and value." Rational behavior therefore seeks to heighten the significance of the consequences focusing on the process of choosing rather than emphasizing the selected alternative (Oliveira 2007). Rational decision making is therefore the model of decision making that is most likely to apply to higher-level decision making of a more serious nature. These are the sort of decisions that managers and higher-level leaders are faced with in their leadership roles. Rational decision making as defined in a business dictionary is "a method for systematically selecting among possible choices that is based on reason and facts. In a rational decision making process, a business manager will often employ a series of analytical steps to review relevant facts, observations and possible outcomes before choosing a particular course of action." In rational decision-making models, decision makers evaluate a number of possible substitutions from different possible situations before selecting a choice (Oliveira 2007). These possible situations or scenarios are weighed by probabilities, and decision makers can determine the expected end result for each choice (Oliveira 2007). The final choice that the decision maker chooses would be the one offering the best-predictable consequence and with the highest prospects of consequence (Oliveira 2007).

## Rational Choice Theory

Rational choice theory is a context for understanding and properly modeling social and economic behavior (Blume and Easly 2008). The basic idea of rational choice theory is that cumulative social behavior results from the behavior of individual actors, each of whom is making their individual decisions (Blume and Easly 2008; Sen 2008). The theory therefore focuses on the determinants of the individual choices (Blume and Easly 2008; Sen 2008). Rational choice theory then supposes that an individual has preferences among the available choice alternatives that allow them to state which possibility they prefer (Blume and Easly 2008; Sen 2008). These preferences are also supposed to be complete (the person can always say which of two alternatives they consider preferable or that neither is preferred to the other) and transitive (if option A is preferred over option B and option B is preferred over option C, then A is preferred over C) (Blume and Easly 2008; Sen 2008). The rational agent is assumed to take account of available information, probabilities of events, and potential costs and benefits in determining preferences and to act consistently in choosing the self-determined best choice of action (Blume and Easly 2008; Sen 2008).

## Rational Decision Making and Intuitive Decision Making

The rational style according to Russ et al. (1996) is "deliberate, analytical and logical; rational decision makers assess the long-term effects of their decisions and have a strong fact based task orientation to decision making" (p. 5). Rotter (1966) opined that the rational style seems related to initiation of a structure and an internal control orientation. Kholi (1989) has posited that both initiation of a structure and a higher internal control orientation may be linked to higher performance. A most directly opposing decision-making model will be the intuitive decision-making model. Employing the intuitive style for making decisions on the other hand involves feeling orientation and is based on an internal ordering of the information leading to hunches (Russ et al. 1996). These intuitive decisions are made relatively quickly and with limited information and often changed if the intuition was in error (Russ et al. 1996). Russ et al. suggest, "Intuitive decision makers are likely to be more error-prone and inconsistent, which may lead to uncertainty and loss of confidence in the manager by superiors and subordinates" (p. 5). In a high-stake environment, this type of decision making may be quite

risky. If the decision turns out to be error-prone, for instance, in an environment where financial stakes are high, the consequences may be rather costly. Rational decision making is therefore predominant where investor stakes and life stakes in general are high. Intuitive decisions are also made when there is a dearth of facts and information, when there is need to come up with an immediate solution to a problem, and also when the decisions to be made are challenging. Rational decision making on the other hand is often characterized by a precision-based process. This process involves gathering adequate material in terms of availability of information, value of the information, precision of the information, and reliability of the information. There is usually a need to ensure that the solution reached is fail proof. This is because a properly analyzed fact-based decision will typically result in a positive and effective solution. There are setbacks to this process however; this materializes in terms of human inability to gather adequate materials of information. It is not unusual for the decision maker to back down or settle for the amount of material information at their disposal.

## Rational Decision Making and Demographic Variables, Age and Gender

Rational decision making has been studied in terms of demographic variables. Two of the most commonly studied demographic variables are age and gender. According to Uzonwanne (2016), "through multiple comparisons examining differences in decision making by age and gender, analysis showed that almost the same number of males and females used the rational decision-making models." Though the mean scores were generally high, comparisons show that executives who were 60 years and older used the rational decision-making model more than any other age group; age may therefore be a factor for the use of rational decision-making model (Uzonwanne 2016). Löckenhoff (2011), in a review of the behavioral literature, reveals that older adults are often more willing to wait over short-time delays for a larger amount of money compared to a smaller amount of money available immediately. Neuroscience research suggests that the accumulation of experience with delayed rewards over the life span may serve to tune activity in regions like the ventral striatum (Samanez-Larkin 2013). In two recent datasets, reported by Samanez-Larkin (2013), the strong sensitivity to immediately available rewards in the striatum in young adulthood is reduced in older age as older adults show similar activity for rewards available now or later (Eppinger et al. 2012; Samanez-Larkin et al. 2011). One interpretation is that it is as if the older folks know that $20 is going to be just as good in 2 weeks as it is today and those in their twenties just haven't had the opportunity to realize interest rates over decades and appreciate the long-term rewards of waiting (Samanez-Larkin 2013). This may be a situation where attempts should be made to try and get those impatient young people to make decisions more like the older folks (Samanez-Larkin 2013).

## Suppositions of Rational Decision Making

Suppositions of rational decision making assume that people naturally want to make the best choices everytime there is an investment involved or something of value is at stake. For instance, people shop for a product of their desire, and when such a product is found, the individual will mostly carry out some sort of information gathering, so as to ensure that they are actually getting their investment's worth. This is known as rational choice (Scott 2000). According to Scott (2000), it has been assumed that people are motivated by money and by the possibility of making a profit, and this has allowed it to construct formal, and often predictive, models of human behavior. One of these models of human behavior is the rational choice theory. The rational choice theory was built around the idea that all action is fundamentally "rational" in character and that people calculate the likely costs and benefits of any action before deciding what to do (Scott 2000). Another related supposition is that an individual is cognitively capable of searching for and gathering useful facts that aid their final choice. Such information and facts are based on success criteria pertinent to the situation or the individual. The individual is able to create the time and also the resources

required for rational decision making in order to achieve an effective and functional solution.

## A Model of Rational Decision Making

Rational decision making may involve several different processes. Regardless of the various steps in each process, rational decision processes have similarities that mostly result in effective solutions. A model of rational decision making is presented in the following steps:

1. Identifying the problem that requires a solution
2. Identifying the solution scenario
3. Carrying out a gap analysis
4. Gathering facts, options, and alternatives
5. Analyzing option outcomes
6. Selecting best possible options
7. Implementing decision for solution and evaluate final outcome

### Identifying the Problem that Requires a Solution

It is important in any problematic situation to properly clarify what the problem is that requires a distinct decision-making process for a solution. If the problem is not properly understood, the decision maker may engage in doing too much or too little to solve the problem. As a president-elect, the Obama-Biden team created an elaborate document on "change.gov" (The Obama-Biden Plan) highlighting a detailed description of the problems America faced at the time. It was not enough to say that America was in a recession; the beginning of a rational solution was to understand what aspects of the American economy defined the recession. A manager of a restaurant in financial distress must be able to accurately define the nature and source of the problem. If the nature and source of the problem are not accurately defined or identified, the manager stands a risk of throwing solution options at a situation that is working well or doing little to resolve the actual problem.

### Identifying the Solution Scenario

Equally important in the rational decision-making process is defining what a solution scenario will look like at the end of the process. What characteristics will determine that a solution has been found? In other words, what will success look like? What are the identifiers that will be observed to characterize success? For instance, if XYZ are in place, will that mean success? For some managers, if the organization's financial returns are enough to pay the bills, remunerate the employees, and also have enough profit to service investor portfolios, then that is a picture of success. For some other managers, that is a problem that requires rational decision making for solution. Indices and marginal qualifiers are some determinants of success for many. If the numbers fall beyond the preset indices or qualifiers, then a problem is identified. Success will simply mean that the profit levels have exceeded the preset indices and qualifiers by a preset minimum ratio. Understanding what success will look like is inevitable for accurate gap analysis.

### Carrying Out a Gap Analysis

A gap analysis is simply defining and understanding the gap between the problem and the solution. What is it going to take, for instance, for the organization to go from the identified problem to the identified solution? The business dictionary defines gap analysis as "a technique that businesses use to determine what steps need to be taken in order to move from its current state to its desired, future state." In other words, now that the problem has been accurately defined and an accurate picture of success has been determined, the next step will be to determine what it takes to go from problem to solution. Again, the Obama-Biden team was able to clearly document the steps that they were going to take to bring America back to where they had identified as success for the nation. This is an aspect of rational decision making that should involve other people as think tanks. In this regard, all the possible steps involved with the gap analysis will be mostly identified. If the solution will require project management for solution, the steps identified in the gap analysis will become the specific goals and specific success criteria that will be achieved toward success. During think tank sessions, the

manager or management is able to accurately analyze where the organization is and where they want to be but, most particularly, how to get there.

### Gathering Facts, Options, and Alternatives

The next phase in this rational decision-making model is to gather facts and options surrounding the steps that have been identified in the gap analysis. To be properly informed is at the center of effective rational decision making. With the information gathered, considerations will be made on how the steps that will be taken will affect the stakeholders involved, positively or negatively. Somebody somewhere may have researched the steps to be taken or may have even taken similar steps. The facts from the outcomes may prove very useful in the eventual decisions made at that point.

### Analyzing Option Outcomes

With the facts in hand, the consequences or outcomes of the various options identified should be analyzed to determine the most effective and functional option. Adequate time should be allotted for studying and identifying the possible outcomes of each of the options to be studied. An integral aspect of the study will be to weigh in on how the different outcomes will impact stakeholders involved. There may be outcomes that do not favor some stakeholders while the same outcomes favor others. Situations like these can be challenging to resolve. This is where a think tank team may be useful again. The goal is to accurately predict the outcome of each of the options selected, and from these predictions, a final option is selected.

### Implementing Decision for Solution and Evaluating Final Outcome

After the best option has been selected, the decision has to be implemented accurately as decided for effective and functional solution. This phase of the model may sound redundant, but it is an imperative aspect of rational decision making. Securing a hitch-free implementation of the decision made provides a successful closure to the process. After the decision or option has been implemented, it is also important to evaluate the final outcome based on the solution scenario that was created in the second step. Has success being achieved? If it is not looking like success, then there is a need to go back to the gap analysis phase and reevaluate the steps decided for the solution process.

## Conclusion

Rational decision making has been defined as a more advanced type of decision-making model, laying emphasis on the characteristics of thorough research and logical evaluation, selecting among possible choices based on reason and facts. The basic idea of rational choice theory which is premised on the assumption that cumulative social behavior results from the behavior of individual actors, each of whom is making their individual decisions, is highlighted. Studies have shown that older adults typically tend to lean toward rational decision making more than younger ones. There were no apparent gender-based differences however. Despite the time and resources involved, comparisons show that rational decision making offers more effective and functional solutions than intuitive decision making. Intuitive decision making is identified as a most directly opposing decision-making model in comparison to rational decision making. Decision-making models in general should be an integral aspect of training focus for all executives, leaders, and managers in the governmental and in the entrepreneurial worlds. Rational decision making should be extensively included in leadership training, seminars, and conferences, specifically those that border around management and sustainable development within organizations and governments. Younger managers and leaders should be particularly identified as recipients of rational decision making based on findings. Suppositions and assumptions of the rational making model are identified, while a decision-making model process is elaborated. Rational decision making is positioned as the most promising, effective, and functional decision-making process for leaders, managers, and individuals, especially when

stakeholders, investments, and high stakes are involved.

# Reality Shock and Public Service Motivation

Carina Schott
Utrecht School of Governance, Utrecht University, Utrecht, The Netherlands

## Synonyms

Other-oriented motivation; Praxis shock; Shattered dreams; Transition shock

## Definitions

Public service motivation is a multidimensional, other-oriented type of motivation. Specifically, it is the willingness and desire to contribute to the public interest and society at large. The term reality shock refers to jarring experiences resulting from a discrepancy or mismatch between what was/is expected by individuals entering a new job on the basis of their professional training and what the real working situation turns out to be.

## Introduction

The concept of public service motivation has received a lot of attention from both public administration scholars and practitioners over the last 30 years. To this day, there is vast body of literature on the antecedents and outcomes of public service motivation (Ritz et al. 2016). Frequently studied outcomes of public service motivation are organizational and individual performance, job satisfaction, and organizational commitment. Transformational leadership, specific human resource practices, and higher levels of education have been found to stimulate public service motivation. However, "only limited progress (e.g., Perry and Vandenabeele 2008) has been made in providing an adequate set of explanations or hypotheses about how PSM develops and why" (Bozeman and Su 2014: 6). Put differently, the dynamics of public service motivation have been

investigated in only a small number of longitudinal studies, which – moreover – found mixed results. Some studies found the concept of public service motivation to increase over time; some found it to remain stable, and there are also studies in which the level of public service motivation was found to drop.

Increases in public service motivation can be explained by Schneider's (1987) frequently studied attraction-selection-attrition (ASA) model and, related to this, the mechanism of organizational socialization (Kjeldsen and Jacobsen 2013). Stable levels of public service motivation have been explained by public service motivation being a trait-like concept or stable predisposition (Bakker 2015). A theoretical explanation frequently cited for the often-found decrease in public service motivation is the so-called reality shock (e.g., Brænder and Andersen 2013; Kjeldsen and Jacobsen 2013). This explanations, even though being a promising one, has only been tested by one small-scale empirical study to this date (Schott et al. 2018).

## Types of Reality Shock

The term "reality shock" goes way back to the work of Hughes (1958) and knows many synonyms such as "praxis shock" (Veenman 1984), "transition shock" (Corcoran 1981), and even "shattered dreams" (Friedman 2006). Initially, the term has been used to describe the discrepancy between how nursing graduates understand their professional role on the basis of their training and the daily working reality they are confronted with when starting to work in healthcare services. This means, "reality shock" is associated with feeling of disillusionment and unsuccessful socialization and fits with institutional theory. In the literature, different types of reality shock can be differentiated. If the understanding nurses develop of their profession through trainings and education does not prepare them for the daily work – if ideals and expectations collapse – they experience a *newcomer's reality shock.* Next to this type of reality shock, employees can also experience a reality shock when switching from one job and employer to another (*new job-related reality shock*), or even during an individual's career within the very same organization. For example, individuals may experience a reality shock if an internal promotion does not bring the expected improvements, such as more responsibilities, autonomy, and task variety (*promotion-related reality shock*).

## Professions Affected by Reality Shock

Even though frequently studied among nurses, the phenomenon of reality shock is not restricted to this particular profession but has also been observed among other public servants such as social workers (Blau 1960), police recruits (Van Maanen 1975), veterinary inspectors (Schott et al. 2018), and teachers (De Cooman et al. 2009). This observation suggests that classic street-level-bureaucrats – individuals who have wide discretion in their work and who are in direct contact with members of the general public (Hupe and Hill 2007) – are often affected by the experiences of a reality shock.

## Public Service Motivation and Reality Shock

Why is the phenomenon of reality shock useful to explain decreasing levels of PSM? A key assumption in the public service motivation literature is that public-service motivated individuals are driven to benefit society and that they want to contribute to the public interest through their work (Schott 2015). However, in his seminal work, Lipsky (2010) argues that the very nature of public sector work prevents individuals from even coming close to the ideal conceptions of their jobs. Because of increasingly scarce resources and constantly high workload, combined with high levels of red tape and often unpredictable as well as ungrateful clients, public-service motivated civil servants experience inconsistencies between their daily organizational life, on the one hand, and their own preferences and commitments to doing something socially useful, on the other. This discrepancy can be further intensified by

new public management reforms, aimed at increasing performance and organizational objectives, such as efficiency leaving public servants less space to maneuver. As feelings of discrepancy are associated with negative outcomes such as rule ambiguity, internal conflicts, frustration, and dissatisfaction (Duchscher 2009), individuals try to reduce this discrepancy. As a result, newly employed teachers, for instance, have been found to resign from their first job as teacher and look for alterative work that is more in line with their education-bred expectations (Stokking et al. 2003). An alternative and less drastic way to go forward and to reduce these inconsistencies is to alter one's desire to contribute to the public interest and society at large. Put differently, the mismatch between what public-service motivated people *want* to do in their work and what they actually *can* do – also called "reality shock" – provides a valid theoretical explanation for the often-found drop in public service motivation across time (e.g., Brænder and Andersen 2013; Kjeldsen and Jacobsen 2013). This leads to the question of how experiences of a reality shock can be mitigated in order to maintain highly public-service motivated work forces.

## Ways to Reduce a Reality Shock

Several routes how to reduce a reality shock can be identified. This section focuses on three different key routes, which take place in different phases of people's life: (1) during their professional education, (2) before they start a new job, and (3) while they are working.

First, opportunities to reduce the experiences of a reality shock arise even before employees are in contact with their future employer. Universities and other educational institutions need to be aware of the constantly changing work environment caused by, for instance, technological, societal, and institutional developments and to integrate these changes in their curriculum. This means *close cooperation between training institutes and employers* is a useful way to ensure that training institutes are well-informed about external developments. Only if institutes have this knowledge, they can constantly adjust training programs in order to provide the type of education students need to master their future working life successfully and to develop a realistic picture of how this life will look like.

Second, the findings by a recent study by Schott et al. (2018) suggest that human resource managers can be advised to ensure that newcomers in organizations and individuals who take on a new position within an organization are provided with a realistic and detailed picture of their future tasks as well as potential difficulties and challenges they might encounter at work. Put differently, *clear expectation management* in introductory interviews but also when jobs are advertised and framed can help to reach this aim. If employees are well prepared, they can develop active coping strategies, i.e., strategies that are directed at removing or circumventing stressors (Carver et al. 1989). By applying these strategies, individuals are better able to reduce the inconsistency between what they *want* to do in their job and what they actually *can* do and, as a result, are more likely to maintain their initial levels of public service motivation.

Third, good *mentoring and supervision* when already working seem to matter as well. Newcomers can learn from experienced colleagues how to better deal with unexpected daily work situation in a way that the desire to do something socially useful can be fulfilled and does not need to be readjusted.

## Concluding Thoughts

Combining research on public service motivation with insights from reality shock in order to explain decreasing levels of public service motivation across time is not new, but empirical evidence supporting this relationship is limited. One exception is the recent study by Schott (2018) who conducted small-scaled qualitative research among Dutch veterinary inspectors. This implies additional research is needed using more robust, longitudinal research designs and collecting data among different professionals and in different cultural contexts so that stronger conclusions can be drawn. This type of research would make it possible to more systematically rule out alternative explanations for a

drop in public service motivation such as shifts in personal preferences caused by a major life event. For example, becoming a parent or a serious case of illness within the family or other close persons may present such an event. An additional explanation for decreasing levels of public service motivation may be a change in one's supervisor. Transformational leadership has been found to be a solid predictor for public service motivation (e.g., Wright et al. 2012). A replacement of a supervisor with transformational leadership skills may therefore also be associated with a loss of public service motivation across time.

# Recent Developments in Public Sector Reforms, China and Hong Kong

Wei Li
Department of Government and Public Administration, The Chinese University of Hong Kong, Hong Kong, China

## Synonyms

Administrative reforms; Governance reforms; Government reforms

## Definition

"Public sector reforms" refer to government efforts to change the rules, processes, and values of public sector organizations with the purpose to enhance the efficient, effective, and responsive delivery of public administration and public policy.

## Introduction

This section compares the rationale and impacts of China and Hong Kong Special Administrative Region (SAR)'s major public sector reform initiatives adopted since 1980. Different sociopolitical and institutional contexts in two cases account for the varied reform initiatives and impacts (Cheung 2005).

China's rationale to reform its public sector has been largely driven by its economic development goal and efforts to integrate into the global market. Despite a short period of stagnation in the late 1980s, the general trend is that the function of China's public sector has been transiting from running a planning economy to supporting a market economy (Wong 2009). From the 1980s to the 2010s, public sector reforms have achieved mixed results. On one hand, China's economy has grown fast, and the Communist Party's authoritarian rule has been largely stable. On the other hand, there have been social unrest related to problems ranging from food safety to environmental pollution (Xu 2011).

However, by the time when president Xi Jinping came to power, the corruption problems in the public sector had become so rampant and serious that many new policy initiatives are resisted by powerful vested interests (Saich 2015). With a declining economic growth rate, an aging population, growing wealth gaps, and a social cleavage, Chinese government has taken efforts to reform the public sector institutions so that major policy changes can be implemented (Lam 2015). The aims of current public sector reforms in China are to upgrade the economic structure, facilitate private initiatives, and strengthen the regulatory and service capacities of the government. This entry will review major reform initiatives since 2012 in China. Our discussions of their rationale and impacts are grounded in China's historical and socioeconomic contexts since the 1980s.

Similar to China, Hong Kong's public sector reforms were also initiated in the 1980s. However, the political and economic contexts were very different in Hong Kong. An efficiency unit was established within the government to coordinate the implementation of service-oriented public management reforms. Because British Hong Kong government held policy beliefs of "small government, big market" for a long time, reform measures to enhance efficiency, encourage public-private collaboration, transparency, decentralization, performance pledge, etc., were quickly adopted (Lee and Haque 2006).

After 1997, when the sovereignty was returned to China, Hong Kong encountered severe economic recession and budget deficits. Like many developed areas, facing fiscal constraints, Hong Kong SAR government embraced reform measures to balance its public finance and improve government performance (Painter 2005). The civil service is downsized, expenditure for the statutory bodies is reduced, outsourcing is widely used by the government to deliver services, and citizens' feedback is sought to monitor service quality (Scott 2010; Vyas 2016). With limited public support for its Chief Executive in most of time after 1997, Hong Kong SAR government has sought to reform its own structure to strengthen the governing capacities. This entry will review the major reform initiatives by Hong Kong SAR government after 1997. The discussions of the reform rationale and impacts are related to the historical and socioeconomic contexts since the 1980s.

## Recent Public Sector Reforms in China

### Civil Service Selection

Despite China's efforts to downsize state-owned enterprises and to control government growth since 1980, Chinese civil service strength has been growing. At the end of 2015, China has

over 7.1 million civil servants, compared to 6.6 million in 2008. They include permanent employees working in government agencies, legislative agencies, courts, procuratorates, Chinese Communist Party (CCP) agencies, and people and mass social organizations. By 2009, public finance also support near 5.4 million non-civil service employees working in the aforementioned organizations and other public service organizations such as hospitals, schools, publishing houses, etc. (China Human Resources and Social Security Ministry 2015).

Unlike western democratic countries, there is no institutional arrangement to set the boundary between political executives and civil servants. In other words, the CCP leaders working in the government are also counted as civil servants and managed in accordance with the civil service regulations. The value of political neutrality is regarded as being irrelevant. According to the Civil Service Law, civil servants shall uphold the principle of "Party managing cadres" (dang guan gan bu). The selection and appointment of cadres are still controlled by the Party committees and managed by the Party organization department at a higher level (Burns and Wang 2010). Civil service reforms in China have not yet changed the old nomenclature system but increased the political concentration of power in the Party (Chan 2016).

China has sought to strengthen meritocracy and competition in selection of civil servants since 1980. Starting from Deng Xiaoping, the political leader who opened up China's economy, proposed to select more loyal, younger, intelligent, and professional cadres in the late 1970s (Manion 1993). Since 1989, civil service exams have been held every year to recruit civil servants. In 2015, Chinese government recruited 194,000 civil servants through examination. Since 2013, higher level governments have started to formally use examination to openly select incumbent civil servants from lower level of governments. In 2015, the central government openly selected 232 civil servants, and the provincial governments openly recruited 1726 civil servants. Recruitment by exams have raised educational level and professional qualifications of Chinese civil servants (Burns and Wang 2010).

### Civil Service Reward

Pay level of Chinese civil servants are composed of two parts: salary and allowance. Prior to 2015, on average salary comprises 20–30% of a civil servant' pay, whereas allowance may take 70–80% of a civil servant's income. For the part of salary, there are two components: rank salary and position salary. The level of salary is determined by the national government and implemented universally across the country. The level of allowance varies significantly in accordance with the specific government agencies' affordability. This results in pay differences across districts or community level governments within the same city (Chan and Ma 2011). In addition, there was no regular pay review. The chance to increase pay through promotion is also very little, which demotivate lower-level civil servants. In 2015, the State Council issued the order to adjust the structure of civil service pay, raising the level of salary and increasing its percentage of the total pay to 40%. The salary of civil servants will also take into account the actual tasks civil servant take despite that they may not have high ranks. The order also decided that the civil service pay will be annually or biannually adjusted according to the pay level in enterprises, the inflation rate, and economic situations (State Council 2015a).

Raising civil service pay also smoothens the reform of civil service retirement system. Prior to the reform, civil servants do not need to contribute to a retirement fund. Their pay after the retirement depends upon the level of pay prior to the retirement and will be raised regularly. This resulted in much higher retirement pay for civil servants compared to people working in state-owned enterprises or private sector (Wu 2013). In 2015, the civil service retirement system was reformed to be more similar to those in the private sector. Civil servants' pension will depend on how long they have worked for the government and how much they have contributed to the pension fund rather than the salary level before the retirement. Civil servants who enter the government after the

reform will receive lower level of retirement income (State Council 2015b).

### Performance Management Reform

Chinese government introduced performance management to motivate civil servants, enhance efficiency, and strengthen policy implementation since the early 1990s. For more than three decades, the most important performance targets are economic development and social stability because the promotion and rewards of cadres have largely depended upon these two indicators. There have been a long list of "one vote to veto" targets. If a government agency fails to reach the targets of any one item in the list, its overall performance will be negatively evaluated. The major items of "one vote to veto" targets mandated by the central governments include birth control targets, environmental protection, and production safety (Gao 2010).

Since 2004, a cadre accountability system has been gradually introduced by the Party and the government. According to the system, cadres will be sanctioned if they are responsible for major performance failures. These sanctions include removal from the leadership positions, administrative ranks being lowered, records demerits, etc. (CCP Central Committee 2014). Some senior rank cadres at national and provincial level governments are held accountable due to crisis such as poisonous milk powder incident in 2008, express train clashes in Wenzhou in 2011, and explosion and fire in Tianjin in 2015 (Zhao 2010). However, many of them are found to be promoted to higher rank positions a few years after receiving the sanctions. Frequent turnover of cadres and accountability mechanisms also encourage cadres to choose easy and low-quality approaches to complex policy problems (Eaton and Kostka 2014).

### Transparent Public Budgeting

More transparent public budgeting can contain government corruption and waste. The Budget Law of People's Republic of China was introduced in 1994. It stipulates that governments shall be answerable to the People's Congress, the audit agencies, and the higher level of governments. However, without detailed information about public financial accounts, the public and the People' Congress are unable to hold the government accountable. The Government Information Access Regulation was issued by the State Council in 2007, listing that the government budgets shall be open to the public. However, the published budget items often lack consistency, and the details are not disclosed due to reasons of confidentialities. The interpretation of "confidentiality" by local governments varies. Local governments have been particularly reluctant to release budget items relating to government debts. Much government revenue and expenditure is not included in the budget, which provides opportunities for corruption. Many corruption cases also occur in the process of outsourcing government project. The amended Budget Law was implemented in 2015. It stipulates that government and departmental budgets shall be disclosed to the public after approval. The government shall also explain the implementation of the transfer payment and the government debt. The government purchase shall also be disclosed to the public (Wong 2016).

### Administrative Structural Reforms

Since the 1980s, the State Council ministries have been reorganized about every 5–6 years. Major purposes include efficient coordination among government agencies, reducing civil service establishment, and efficient policy implementation by decentralizing administrative decision-making power. However, the recurring of structural reforms reflects that previous reforms often bring about new problems (Burns and Zhou 2010). For example, in 2012, in Shenzhen municipality, the super-ministry reforms reduced the number of bureau chiefs and deputy chiefs by 25%. The reforms adjusted or cancelled the administrative approval items by 31%. In 2013, the State Council initiated a new round of administrative structural reforms. The reforms are less about reducing the size of the government. As the reform in 2008, State Council reorganizations reflect the CCP's response to policy and governance problems (Dong et al. 2010). Major changes include separating the management of

the state-owned railways from the central government, merging the Population and Family Planning Commission with the Health Ministry, and reorganizing the China Food and Drug Administration. One new emphasis is to reform the social organization management system. Measures include separating the management of social organizations from the government, encouraging competition among the guilds or chambers of commerce, and easing the registration of newly established social organizations in areas of guilds and chambers of commerce, science and technology, charities, and community services (Shieh 2016).

### Collaborative Governance

Since the late 1980s, Chinese government has adopted public-private partnership (PPP) to build and manage infrastructure projects such as airports, sewage systems, bridges, etc. The PPP has enabled the government to share long-term risks with the private sectors in developing economy and urbanizing rural areas in the past three decades. However, the challenges for local governments to attract investors in PPPs include lacking of risk assessment and project evaluation capacity, uncertain legal protection for private operators, and uncertain returns for investors. The government was reported to have often violated contract terms against the interests of private investors (Burns and Zhou 2010).

Since 2013, the central government has adopted PPPs as a major policy tool to accelerate urbanization and boost domestic economy. In 2015, the National Development and Reform Commission publicly recommended 2531 PPP projects in two batches, aiming to invest a total of 3200 billion CNY. By July 2016, 24.4% of the first batch of 1043 projects announced ceased to adopt the PPP mode. In total, only 619 PPP projects (or less than 25%) had successfully signed service agreement with the private investors (China News 2016).
